PENICILLIN THERAPY OF SCARLET FEVER

Comparison with Antitoxin and Symptomatic Therapy

HAROLD L. HIRSH, M.D.
GEORGINE ROTMAN-KAVKA, M.D.
HARRY F. DOWLING, M.D.
and
LEWIS K. SWEET, M.D.
Washington, D. C.

In a previous publication[1] we reported on the efficacy of intramuscular penicillin X in the treatment of 34 cases of scarlet fever. Since that time we have continued to treat this streptococcic infection with other types of penicillin and now wish to report similarly good results in the treatment of 86 patients, representing 52 patients in addition to the 34 in the original group.

PLAN OF STUDY

All the patients studied were on the isolation service of the Gallinger Municipal Hospital. Three criteria were established for the inclusion of a patient in this series: (1) temperature of 102 F. or over; (2) evidence of pronounced toxicity regardless of the height of the temperature, or (3) the presence of a pyogenic compli-

The ages of the patients ranged from 1 to 41 years, although 79 were less than 12 years of age. There were an equal number of males and females; 54 patients were Negroes. All but 6 patients had temperatures of 102 F. or over on admission. Three of these 6 patients had complicating infections of the skin, and the remaining 3 were decidedly toxic, although their temperature was recorded as less than 102 F.

The first 34 patients were treated with penicillin X[2] and the results have been reported elsewhere.[1] Most of the patients in this group received 50,000 units of the medicament every six hours, although early in the study several different dosage schedules were employed. Crystalline penicillin G[3] was employed in the next 5 patients. The dosage schedule established was 25,000 units every three hours. Thereafter we decided to compare the results of penicillin therapy with those of administration of scarlet fever antitoxin. Alternate patients were given either commercial penicillin in doses of 25,000 units every three hours or 9,000 to 27,000 units of antitoxin, depending on the degree of toxicity. Sulfadiazine was given to the patients receiving antitoxin when there were evidences of a pyogenic complication. Twenty-nine patients were treated with penicillin and 25 received antitoxin. Four additional patients who received antitoxin were later eliminated from the series because the evidence was inadequate for the diagnosis of scarlet fever. Seven patients received sulfadiazine *in addition to antitoxin. A final group of 18 patients* were treated with oral penicillin, prepared in tablets containing 25,000 units buffered with calcium carbonate.[4] Since it has been recommended that three to ten times the parenteral dose be given for oral administration, we decided to administer five times our established parenteral dose, or 125,000 units, every three hours.

The duration of treatment is extremely important in the therapy of beta hemolytic streptococcic infections with penicillin. Plummer and his associates[5] showed that the incidence of relapse was high in patients treated for hemolytic streptococcic pharyngitis unless penicillin therapy was continued for four to six days. Our early experience with the use of penicillin in these infections confirmed this observation. We therefore established five days as a minimum period of treatment for scarlet fever. In 3 patients therapy was continued for two to four days longer because of the persistence of complications which had been present on admission. Three patients were given only a single injection of 100,000, 200,000 and 300,000 units, respectively, of penicillin X as a part of an investigation of the absorption and effect of large doses of this penicillin fraction.

Throat cultures on blood agar plates were taken on admission on all patients before treatment was begun, daily thereafter for five days and then at two to three day intervals until the patient was discharged. Some of the streptococci were typed according to the slide agglutination method of Griffith through the courtesy of Mr. J. N. Adam of the Lederle Laboratories, Inc.

RESULTS

The results of treatment of scarlet fever with penicillin were evaluated on the basis of the following criteria: (1) the time required for the temperature to fall and remain below 99 F. rectally, exclusive of fever due to complications; (2) the incidence of pyogenic complications developing after admission, and (3) the number of patients who were found to have beta hemolytic streptococci in their throats after the start of therapy. In table 1 are shown the results of treatment with the various preparations of penicillin. It can be seen that the response was essentially the same irrespective of the preparation and route of administration *employed.*

The various types of temperature response following penicillin therapy are depicted in charts 1, 2 and 3. Most patients had a rapid drop in temperature as shown in chart 1, while in a few the return of the temperature to normal was more prolonged (charts 2 and 3). The average duration of fever following the start of therapy was calculated for each group and found to range from forty-nine to fifty-four hours. The average for the group receiving penicillin X does not include 2 patients, 1 of whom had a normal temperature on admission and was treated because of the presence of an infected finger and another who failed to respond to penicillin therapy. In the case of the latter patient, the administration of penicillin was continued without effect for seventy-two hours, whereupon she was given 18,000 units of antitoxin with prompt improvement. Further study revealed that the type 14 hemolytic streptococcus isolated from her throat was resistant to the concentrations of penicillin found in her blood. The details are shown in chart 4.

Table 1.—*Comparison of the Results of Treatment of Scarlet Fever with Various Types of Penicillin*

Type of Penicillin Employed	Route of Administration	No. of Patients	Average Duration of Fever Following First Dose of Penicillin, Hrs.	No. of Patients Who Developed Pyogenic Complications After Admission	No. of Patients in Whom Throat Cultures Positive for Hemolytic Streptococci Recurred After the Completion of Therapy
X	Intramuscular	34	54	3	4

All types of penicillin..... .	86	52	7%	8%
Symptomatic	123	90	26%	82%

* Calculated from the time of the first dose of penicillin or antitoxin or from the time of admission to the hospital in symptomatically-treated patients.

† Treated in alternation.

In 6 patients pyogenic complications developed following the start of therapy. Two patients who had received single injections of 200,000 and 300,000 units of penicillin X developed recurrent pharyngitis on the third and seventh hospital days, respectively. The first patient was given another injection of 200,000 units with rapid improvement, and the second recovered on symptomatic measures. The course of the second of these patients is shown in chart 5. Three patients, 1 treated with penicillin X and 2 with commercial penicillin, had recurrent pharyngitis on the fourteenth to twenty-first days after penicillin therapy was discontinued, following their exposure to fresh cases of scarlet fever. These 3 patients recovered within forty-eight hours on symptomatic therapy. In the sixth patient there developed a temperature of 101 F., which persisted for forty-eight hours and for which no cause could be determined. Although pyogenic complications occurred only in the groups of patients treated with penicillin X and commercial penicillin, the number of patients treated with oral or crystalline penicillin G intramuscularly was too small to lend significance to the absence of complications. In 3 patients there developed sequelae, namely, rheumatic fever, acute nephritis and serous meningitis.

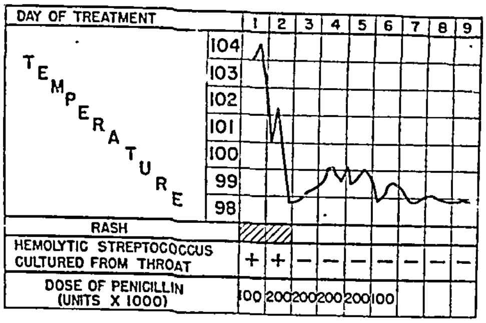

Chart 1.—E. H., Negro girl aged 3.

Among the 86 patients treated with penicillin, a beta hemolytic streptococcus was isolated from the throats of 75 on admission. The throat cultures were free of the organism in each instance within forty-eight hours after treatment was started. Only 5 patients who were adequately treated had a return of the beta hemolytic streptococcus while under observation, which was usually for a twenty-one day period. Three of these patients were exposed to fresh cases of scarlet fever on the fourteenth to twenty-first day after treatment was discontinued. Type 14 beta hemolytic streptococci were isolated from the cultures of material from the throats of the patients at the time of the recurrence as well as on admission. The contacts were found to have the same type of streptococci. The remaining 2 patients were found to have type 4 and type 19 streptococci in their throats on their eighteenth and nineteenth days of hospitalization, which persisted until their discharge on the twenty-first hospital day. Types 8 and 14 streptococci, respectively, had been isolated on admission from the cultures of material from the throats of these 2 patients. The 2 patients who had relapses

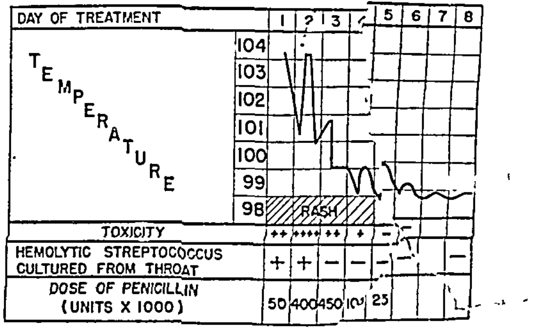

Chart 2.—I. D., Negro girl aged 8.

after inadequate penicillin therapy were found to have type 17 streptococci on admission and at the time of the relapse. The organisms disappeared from the throat cultures of 1 of these patients following an injection of 200,000 units of penicillin and from those of the other, who was treated symptomatically, after eight days. The effect of penicillin on the pharyngeal flora was independent of the type of penicillin employed or the method of administration.

Although only 18 patients have been treated with oral penicillin in comparison to 68 patients treated by the intramuscular route, in the small group the results were equally as good as in the patients treated parenterally. It must be borne in mind, however, that the oral dose was five times as great as the parenteral.

COMPARISON OF THE RESULTS OF PENICILLIN THERAPY, ANTITOXIN AND SYMPTOMATIC THERAPY

In table 2 we have listed the results of treatment with penicillin as compared with antitoxin on the basis of the three criteria established for the evaluation of therapy. It can be seen that the average duration of fever after the administration of antitoxin was twenty-nine hours as compared to fifty hours for the penicillin-treated patients. Of the 29 patients treated with penicillin, only 3 (10 per cent) had mild pyogenic complications consisting of mild pharyngitis on the fourteenth to twenty-first days after the completion of therapy. These complications can probably be accounted for on the basis of exposure to fresh cases of scarlet fever. Further treatment was not required, and the patients were improved within seventy-two hours after the onset of the recurrence. On the other hand, in 11 of the 25 patients (44 per cent) given antitoxin there developed pyogenic complications, consisting of 7 cases of otitis media, 2 cases of cervical adenitis and 2 cases of recurrent pharyngitis. All these patients were given sulfonamide therapy. Moreover, while only 10 per cent of the penicillin-treated patients had a return of hemolytic streptococci late in their hospital stay, 85 per cent of a similar group of patients treated with antitoxin continued to have the organisms in their throat for the greater part of the observation period of three weeks. The advantages of penicillin in preventing the carrier state are obvious.

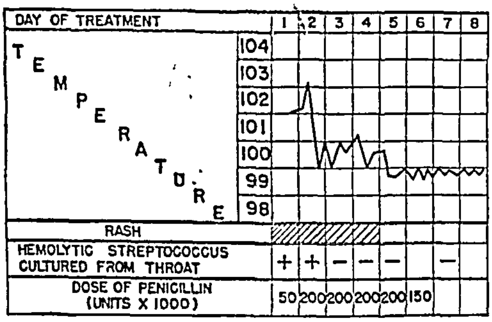

Chart 3.—D. D., white boy aged 14.

Meads and his associates [6] have reported on the treatment of 9 patients with 15,000 units every four hours for seven days. These investigators concluded that penicillin eliminated the hemolytic streptococcus carrier state and prevented complications due to this organism but that it did not influence the eruption and toxic manifestations of scarlet fever. We have compared the course of scarlet fever in 86 patients treated with penicillin with the course in 123 patients who were given only symptomatic therapy because the disease was considered too mild for additional treatment (table 2). The incidence of complications was 7 per cent in the penicillin-treated group compared with 26 per cent in the group treated symptomatically. The streptococcic carrier rate before discharge from the hospital was 8 per cent in the former and 82 per cent in the latter group. These results are in accord with the observations of Meads and his associates,[6] but in addition we found that penicillin reduces the toxicity and hastens the disappearance of the eruption. The average duration of fever was fifty-two hours in the patients treated with penicillin compared with ninety-nine hours in the group treated symptomatically. The decrease in toxicity paralleled the fall in temperature. Although the character of the rash in scarlet fever is exceedingly variable and difficult to evaluate, we were convinced that in the majority of instances the rash disappeared more rapidly in the penicillin-treated group of patients.

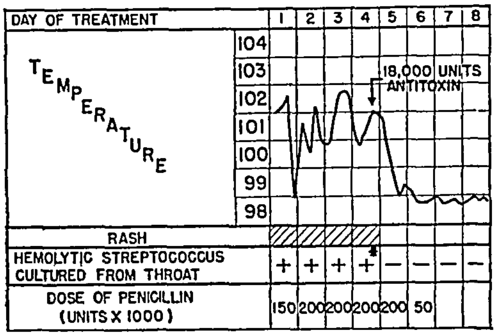

Chart 4.—E. H., Negro boy aged 4. * Hemolytic streptococcus sensitive to 0.625 unit of penicillin. The highest blood concentration equaled 0.156 unit of penicillin.

COMMENT

Although penicillin has been found to be highly bactericidal for the beta hemolytic streptococcus, the question of whether the various types of the antibiotic would be equally effective in the treatment of scarlet fever had to be determined. On treating 86 patients, we found that penicillin decreased the toxicity, greatly diminished the incidence of pyogenic complications and practically eliminated the carrier state.

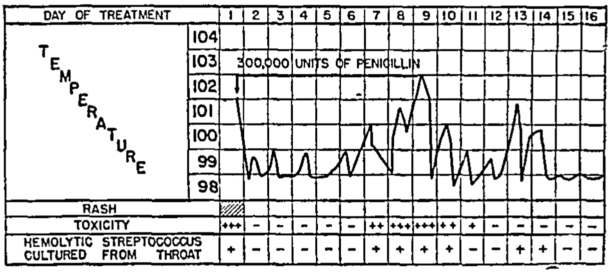

Chart 5.—M. D., white woman aged 29.

Our second problem was to determine a practicable dosage schedule. The administration of 25,000 units intramuscularly or 125,000 units orally of penicillin G every three hours for five days was found to be an adequate regimen for the great majority of patients. Fifty thousand units of penicillin X every six hours were equally efficacious. All but 1 of the patients

treated according to these dosage schedules recovered uneventfully. Since the hemolytic streptococcus isolated from the throat of this patient was a more resistant organism, it is probable that the patient would have responded to penicillin had she received larger doses. The need for at least five days of treatment is demonstrated by the fact that 2 of 3 patients treated for shorter periods relapsed.

The results obtained by Epidemiology Unit no. 82, United States Naval Hospital, Treasure Island[7] were similar to ours. In patients treated for three days and receiving a total dose of 240,000 units, the incidence of pyogenic complications was 31 per cent and the recurrence of positive throat cultures was 77 per cent. When patients were treated for six days with 360,000 units the figures were 14 per cent and 27 per cent, respectively. Complications occurred in only 6 per cent of the patients and recurrence of positive throat cultures in only 8 per cent when treatment consisted of 480,000 units given during an eight day period. This group of investigators employed small doses consisting of 10,000 units every three to six hours.

The third problem was to compare the results of penicillin and antitoxin therapy. For this purpose two groups of patients were treated with each agent in strict alternation. The incidence of pyogenic complications in the group treated with penicillin was 10 per cent, compared with 44 per cent in the antitoxin-treated group, and the incidence of positive throat cultures after the start of therapy was 7 per cent and 85 per cent, respectively, for the two groups. On the other hand, the temperature took nearly twice as long to fall to normal in the penicillin-treated group as in the antitoxin-treated patients. Although this difference appears well defined, observations of the patients demonstrated that both groups felt as well within the same period of time. Usually the fall in temperature after the administration of antitoxin was precipitous. The fall in temperature following the initiation of penicillin therapy was generally rapid, but frequently there were slight elevations for a day or two, during which time the patients appeared and felt relatively well. It was these small spikes in temperature which prolonged the figures for the average duration of fever as determined by our criteria.

There were other apparent advantages of penicillin over antitoxin. Fourteen patients treated with penicillin entered the hospital with preexisting complications such as otitis media, cervical adenitis and infections of the skin. All recovered uneventfully from both the scarlet fever and the complication coincident with the use of penicillin. Several of these patients were treated for two to four days longer than the time prescribed for the treatment of the scarlet fever because of the relatively slower improvement of the complication. Penicillin obviated the need for sulfonamide drugs, which were administered to the patients treated with antitoxin who had evidence of pyogenic complications.

A further advantage of penicillin over antitoxin in the routine treatment of scarlet fever is the elimination of the frequent occurrence of serum sickness following the use of antitoxin. Among the 25 patients treated with antitoxin in the present study, for instance, 3 manifested serum sickness, whereas none of the 86 patients receiving penicillin showed any symptoms of hypersensitivity to this antibiotic.

Ashley[8] has reported that penicillin plus antitoxin is superior to antitoxin alone. We are unable to evaluate these observations because we did not employ the two agents in combination. It appears from our results that adequate penicillin therapy is sufficient for the treatment of most patients with scarlet fever. An occasional patient who is critically ill with this disease, however, will undoubtedly require antitoxin as well as penicillin. Based on our experience with 1 patient who failed to respond to penicillin, it would appear that any patient who does not improve after forty-eight hours of antibiotic therapy should be given larger doses of penicillin on the presumption that the streptococcus is relatively resistant to penicillin and probably should receive antitoxin also.

From a comparison of the results of penicillin therapy and symptomatic therapy of scarlet fever, it would appear prudent to treat mild cases of this disease with penicillin to reduce the incidence of pyogenic complications, which in themselves may be serious problems, even though the toxicity is not sufficient to require the use of penicillin.

Now that the value of penicillin in the treatment of scarlet fever has been established, one might conjecture as to the mode of action. Two of us[9] have shown that penicillin does not neutralize the erythrogenic toxin of the hemolytic streptococcus. Since penicillin in adequate concentrations is bactericidal for penicillin-sensitive organisms, it appears that this antibiotic brings about rapid disappearance of the beta hemolytic streptococci and thus eliminates the source of the erythrogenic toxin. The small amount of toxin already formed by the bacteria is apparently neutralized by the defenses of the body.

At present, we would recommend that all patients with scarlet fever be given penicillin intramuscularly in doses of 25,000 units every three hours of commercial or crystalline penicillin G or in doses of 50,000 units every six hours of penicillin X, or orally in doses of 125,000 units of commercial penicillin G every three hours. Severely toxic patients should receive antitoxin in addition. Penicillin therapy should be continued for at least five days, or until the patient has recovered from all pyogenic complications.

SUMMARY AND CONCLUSIONS

1. Eighty-six patients with scarlet fever have been treated with penicillin X, crystalline penicillin G and commercial penicillin.

2. Penicillin therapy resulted in a prompt fall in temperature, a decrease in toxicity and a decided reduction in the incidence of pyogenic complications and of the carrier state.

3. Penicillin was more effective than antitoxin or symptomatic therapy in the prevention of complications and in reducing the number of carriers and was equally as effective in decreasing toxicity. Antitoxin caused a more rapid decline in temperature than did penicillin. On the other hand, the temperature dropped more rapidly in patients given penicillin than in symptomatically-treated patients.

ADDENDUM

Since this paper was submitted for publication an additional 50 patients have been treated with 100,000 units of penicillin administered every four hours orally. The fall in temperatures and the decrease in toxicity were prompt. In none of the patients did there develop a pyogenic complication, and the beta hemolytic streptococcus disappeared during therapy in each instance.

PENICILLIN FOR SCARLET FEVER

ARCHIBALD L. HOYNE, M.D.
and
ROWINE HAYES BROWN, M.D.
Chicago

Almost from the moment penicillin became available for therapeutic purposes its value in the treatment of streptococcic infections was acknowledged.[1] For that reason we believed it desirable to determine if penicillin would be an efficient agent in the treatment of scarlet fever. We considered that it ought to be helpful in combating scarlet fever regardless of whether the disease was mild or severe. Consequently, during the past fourteen months we have used penicillin as an exclusive therapeutic agent for 116 patients with scarlet fever.

Since beginning our observations on the action of penicillin in scarlet fever, Meads, Flipse, Barnes and Finland [2] have published a report concerning 9 patients with scarlet fever who were treated with penicillin. Ashley [3] stated recently that the treatment of choice for scarlet fever consists in giving both convalescent scarlet fever serum and penicillin. But on the basis of past experience we believe equally good results may be obtained by the use of convalescent scarlet fever serum alone.[4] Other clinicians [5] have reported success with the sulfonamide compounds. However, in our opinion sulfonamide drugs are not of value in overcoming the toxemia of scarlet fever. Our primary purpose in making this study was not to demonstrate whether penicillin was more effective than sulfonamide compounds or convalescent scarlet fever serum against scarlet fever, but to decide if any beneficial response from the use of penicillin could be shown. On that account, we administered only penicillin to one group of patients and to other groups gave a single therapeutic agent for comparison.

Between Jan. 1, 1945 and March 1, 1946, 548 patients with scarlet fever were admitted to Municipal Contagious Disease Hospital. Of that number, besides the 116 who were given penicillin, 69 were treated with convalescent scarlet fever serum, 48 with one of the sulfonamide drugs and 2 with scarlet fever antitoxin; the remaining 312, who were given neither serum nor drug, served as controls. Owing to the fact that scarlet fever antitoxin was used only twice, these 2 instances are excluded from further consideration. Likewise, the single fatality among the 548 admissions is not included in any of the groups, because the patient concerned had received convalescent scarlet fever serum before she entered the hospital. However, we treated her with penicillin, but she died as the result of hepatitis and pericarditis which were present at the time of admission.

No criterion was followed in regard to selection of the remedies employed. Therefore we feel that some comparison of the different groups is justified for the following reasons: (1) all patients were treated in the same hospital in a given period of time; (2) in each group there were mild, moderate and severe instances of the disease, and (3) evaluations in respect to treatment were based on the impressions formed by the same observers through personal contact and study. Before analyzing the several groups it should be stated that scarlet fever in Chicago has been unusually mild during the past few years. This last fact is emphasized by the occurrence of only 1 death in our total series of 548 patients. Possibly a more informative comparison could have been made of the various methods of treatment if the disease had been of greater virulence.

Table 1.—*Forms of Scarlet Fever and of Treatment*

	Mild	Moderate	Severe	Total
Penicillin	52	55	9	116
Convalescent serum	44	23	2	69
Sulfonamide compounds	37	11	0	48
Control	200	110	2	312
Total	333	199	13	545

Table 2—*Averages Relating to Days Ill, Duration of Fever and Duration of Rash*

		Average			
	Patients	Days Ill on Admission	Temperature on Admission	Duration of Fever After Admission	Duration of Rash
Penicillin	116	3 86	101.69 F.	3 46	2 93
	69	2 98	101 9 F.	3 49	3 42
	48	3 5	100 88 F.	2 98	3 04
Control	312	3 2	100 88 F.	2.60	3 44

In table 1 the patients are classified according to the severity of the illness and are grouped in respect to the form of therapy administered. The number of mild cases was about 4 to 5 times greater among the controls than in any of the other groups. This fact is reflected by the low percentage of complications occurring in the control group. A somewhat similar situation exists in respect to the patients whose disease was classified as moderate. The number of severe cases was too small to permit any thoroughly satisfactory conclusions. In the various groups there was no special selection of patients either according to age or sex. Although the ages ranged from 7 months to 41 years, most patients were children. The average for all ages was 8.2 years. There was an almost equal division in respect to sex.

In table 2 the 548 patients are divided according to both method of treatment and average number of days ill at the time of admission. Although the average number of days ill was higher for the penicillin treated group, there is no sharp difference in the corresponding averages of the other groups. These averages suggest that the prognostic expectancy for patients in the group given penicillin would be the least favorable.

Again in table 2 it may be seen that the average range of temperature at the time of hospitalization varied bu

slightly among the groups. An unexpected observation had to do with the duration of fever after the date of admission. For the groups receiving penicillin and convalescent serum the average number of days of pyrexia after admission was 3.46 and 3.49, respectively, whereas the corresponding figures for the sulfonamide-treated groups and the control patients was 2.98 for the former and 2.60 for the latter. The lowest average, which was for the control group, may be explained by the fact previously alluded to; patients in this group constituted by far the largest number of mild cases.

An additional point of interest was that notwithstanding the proportionately high average for the duration of temperature in the penicillin-treated patients, the average number of days of the rash was less than that in any of the other groups. For the penicillin-treated group the rash persisted for an average of 2.93 days; for the group receiving serum, 3.42; for the sulfonamide-treated group, 3.04, and for the control patients, 3.44 days.

In table 3 the complications which were present prior to admission and those which developed afterward are set forth with the respective percentages. The figures disclose two notable facts, one of which is contrary to general opinion. In the first instance it may be observed that sulfonamide-treated patients were not protected against further infection, because in 31.25 per cent in the sulfonamide group complications developed after therapy was begun; secondly, the percentage of complications which developed after the institution of treatment in the group given penicillin was less than half as great as that for those patients who received either sulfonamide compounds or convalescent serum.

TABLE 3.—*Complications in Relation to Time of Treatment*

		Before		After		Total	
	Patients	No.	%	No.	%	No.	%
Penicillin	116	29	25.0	18	15.51	47	40.51
Convalescent serum	69	1	0.014	26	37.67	27	39.13
Sulfonamide compounds	48	11	22.9	15	31.25	26	54.16
Control	312	3	0.003	58	18.58	61	19.55
Total	545	44	8.0	117	21.4	161	29.5

Among the entire group of 548 patients only 4.2 per cent suffered from suppurative otitis media during the entire course of their illness. This is an extremely low figure if compared with past years in which it varied from 12 to 14 per cent.[6] The small number of auricular complications cannot be attributed solely to improved methods of treatment, because in almost exactly one-half the patients who had a suppurative otitis media this complication developed after they received treatment. However, no patients had mastoiditis develop after entering the hospital, and only 6 had evidence of mastoiditis when admitted. Sinusitis accounted for 34 complications after admission, and nephritis developed in 5 patients. If the mild degree of generalized adenopathy which customarily occurs in scarlet fever is disregarded, cervical adenitis was present in a surprisingly small number of patients; there were only 13 instances of this complicatioon and all but 1 occurred after admission; 9 were in the control group. The penicillin-treated group embraced the largest number of patients who had complications at the time of admission. These included 4 with suppurative otitis media and 5 with catarrhal otitis media, 1 with peritonitis, 2 with bronchopneumonia and 1 with lobar pneumonia.

Among the treated groups the dosage of convalescent scarlet fever serum averaged little more than 20 cc., which was administered either intramuscularly or intravenously. While this is a small dose we have found in the past that such an amount was frequently effective in combating moderate attacks of scarlet fever. The sulfonamide group was treated with either sulfadiazine or sulfathiazole; in either case the dosage was practically the same. Adults were given 1 Gm. every four hours and children received half as much at similar intervals. The average number of days for sulfonamide administration was six. No unfavorable reactions took place.

For the penicillin-treated patients there was considerable variation in the number of days that this drug was used. Our procedure consisted of giving 10,000 units of sodium penicillin intramuscularly every three hours both day and night until the patient's temperature remained at a normal level for twenty-four hours. The average amount of penicillin which each patient received in the course of this treatment was 499,823 units, and the average number of days required for its administration was 5.4. Material from the nose and throat was not cultured at the end of treatment to determine whether or not hemolytic streptococci were present.

COMMENT

Among 548 consecutive hospital patients with scarlet fever there was only 1 death. As may be inferred from this fact, the disease was mild in most instances. All patients were divided into four groups: (1) 116 who received sodium penicillin; (2) 69 treated with convalescent scarlet fever serum; (3) 48 who were given one of the sulfonamide compounds, and (4) 312 controls. The cases in all groups were classified according to the severity of the infection as mild, moderate and severe. While there is pronounced disparity in the totals of the several groups, we believe that there is some basis for comparison.

Our study was purely a clinical one for the purpose of observing any advantages which penicillin might have as a therapeutic measure for scarlet fever. We found that penicillin exerted no special influence on temperature; the average duration of pyrexia after the institution of treatment was 3.46 days, whereas for the sulfonamide-treated group it was 2.98 and in the control patients only 2.60 days. For the group receiving convalescent serum the corresponding figure was 3.49. Nevertheless, in considering the temperature curves it is noteworthy that the penicillin group had the highest percentage of complications at the time of hospitalization. These results are in general agreement with the data of Meads, Flipse, Barnes and Finland.[2] On the other hand, contrary to the observations of these same authors, the duration of the rash seemed to be influenced in our penicillin-treated group, in which it averaged 2.95 days, whereas for the serum and sulfonamide groups the average duration of the rash was 3.49 and 3.04 days, respectively.

CONCLUSION

One hundred sixteen patients with scarlet fever were successfully treated with penicillin.

On the basis of our observations, penicillin is equally as good a therapeutic agent for scarlet fever as convalescent scarlet fever serum.

Penicillin is superior to sulfonamide drugs as a therapeutic measure for scarlet fever.

The most important advantage which the penicillin-treated patients possessed was that fewer complications followed its use than occurred with other forms of therapy.

Because our study included but few cases of severe scarlet fever, we believe a thoroughly reliable estimate of penicillin's worth can only be determined by using it against virulent types of scarlet fever.

Until it is proved that penicillin far outweighs in efficiency all other kinds of treatment for scarlet fever, its customary method of administration must be regarded as an obstacle to its use.

THE REPAIR OF ARTERIOVENOUS FISTULAS

Evaluation of Operative Procedures and Analysis of Fifty-Three Cases

E CRAIG HERINGMAN, M D.
JAMES D. RIVES, M D
and
HARRY A. DAVIS, M D.
New Orleans

For many years the physiologic effects of arteriovenous fistulas have been the subjects of extensive study and experimentation. This work has been given added impetus by the occurrence of successive wars. Much of the reported physiologic data is controversial in nature, but from the clinical point of view very little controversy has arisen in the choice of surgical operations for arteriovenous fistula. The consensus has been that quadruple ligation with excision of the aneurysm is the ideal surgical procedure, although several ingenious operations have been devised to fit special cases. Elkin in a recent editorial [1] expressed the opinion that in general quadruple ligation with excision is the procedure of choice. Herrmann and Reid [2] advocated excision of the involved artery and vein together with the communication as the best means of effecting a cure. Holman [3] in his monograph has stated that the safest and most effective method of dealing with an arteriovenous fistula is quadruple ligation with excision. Most men believe that the danger of gangrene is not great because the collateral circulation is adequate in these patients.

However, much interest has been aroused by several recent reports which have advocated the reestablishment of the main arterial pathway because the end results following quadruple ligation have not been satisfactory. The fundamental problem is to determine whether arterial suture is really necessary when the more commonly performed ligation operation has been successful, provided sufficient time is allowed for the development of collateral circulation before surgical intervention Maybury,[4] reporting on war casualties in England, pointed out that, despite the presence of an adequate collateral circulation, successful ligation of a main artery is always followed by a reduction of blood pressure amounting to that of 10 to 20 mm. of mercury below normal in the affected limb, with some permanent wasting of distal muscles. He went on to state that although the patient's permanent disability will not be severe and may not interfere with his work as a civilian, nevertheless his limb will not withstand heavy labor and severe fatigue.

In 1945 Blakemore and Lord [5] reported 3 cases of arteriovenous fistula in civilians whose occupations required considerable physical exertion. The detailed follow up in these cases showed that after quadruple ligation had been performed each patient experienced pain and fatigue in the leg on full exertion. One patient, a dancer, was unable to resume his work because of symptoms involving his leg after the surgical operation. The other 2 "were unable to indulge in vigorous sports or exercise to which they had been accustomed before receiving the injury."

Bigger [6] and Freeman [7] both have shown recently that resection of the main artery for arteriovenous fistula does not cause an acute circulatory disturbance but is usually followed by evidence of persistent circulatory deficiency.

Table 1.—*Vessels Involved in Fifty-Three Cases of Arteriovenous Fistula*

Head and Neck		Upper Extremity		Lower Extremity	
Vessel	No	Vessel	No	Vessel	No.

Subclavian	3		. ..	Posterior tibial	1
Total	13	Total .	8	Total	32

Because of these differences in opinion, the present study was undertaken in an effort to evaluate the results of various surgical procedures used to treat this condition.

PRESENTATION OF MATERIAL

Scope of Study—The records of 53 patients with arteriovenous fistula treated in the past twenty years at Touro Infirmary and at Charity Hospital of Louisiana in New Orleans were reviewed. Many of the cases have been reported previously in great detail, and we are deeply indebted to the members of the surgical staffs of these institutions for permission to use their records in this study.

Table 1 shows the vessels involved in these cases. Of a total of 53 cases 13, or 25 per cent, occurred in vessels of the head and neck; 8, or 15 per cent, occurred in vessels of the upper extremity, and 32, or 60 per cent, occurred in the vessels of the lower extremity.

A study of the surgical report in each case showed that in general three main types of surgical operations were used: (1) ligation operations; (2) restorative procedures, and (3) intrasaccular obliterative procedures.

Ligation Operations—1. Twenty-six patients were treated by quadruple ligation of the main vessels, with

excision of fistula and sac. In the excision of the fistula many patients also required ligation of numerous collateral vessels which were communicating with the sac.

2. Six patients were treated by ligations less than quadruple. These included intracranial fistulas and others in which quadruple ligation could not be performed. One patient required a triple ligation because the distal portion of the vein had become obliterated in the scar following the original trauma.

Table 2.—*Cases with Evidence of Vascular Insufficiency*

Type of Surgical Operation	No. of Cases	No with Vascular Insufficiency	%
(*a*) Restorative procedures	8*	0	0.0
(*b*) Ligation operations	29†	8	27.5
(*c*) Intrasaccular obliterative procedures	7	5	71.0

* The 2 fistulas that were clamped and ligated were eliminated from our statistical study because restoration of the artery was unimportant for maintenance of blood flow to the area supplied by the involved vessels. Two additional cases were eliminated because the artery was obliterated in an attempt to perform a transvenous arteriorrhaphy and therefore were included with the obliterative procedures.

† Seven additional cases were eliminated because the involved vessels were either intracranial or their restoration was unimportant for maintenance of blood supply to a part (e. g. ulnar, radial, occipital and temporal arteries).

Table 3.—*Postoperative Vascular Insufficiency*

Case	Vessels	Type of Operation	Evidence of Vascular Insufficiency
3	Superficial femoral	Obliterative endoaneurysmorrhaphy	Recurrence of fistula two weeks after surgical operation
4	Brachial	Sextuple ligation and excision of fistula	Loss of radial pulse, ischemia of fingers and swelling of arm and forearm; pain in hand three months after operation
6	Superficial femoral	Obliterative endoaneurysmorrhaphy	Color changes of toes and ulcer on dorsum of foot preoperatively; progressive necrosis of toes and pain in foot postoperatively; ulcer did not heal
10	*Superficial femoral*	*Quadruple ligation with excision*	*Ischemia; pain persisted after surgical intervention*
11	First portion of right subclavian artery and innominate vein	Quadruple ligation; also ligation of right internal and external jugular veins	Hand and arm purple and cold; right hand weaker than left six months after operation
15	Right brachial artery and basilic vein	Obliterative endoaneurysmorrhaphy	Onset of cold weather caused fingers to become excessively blue, numb and cold; cervicodorsal sympathetic block required
20	Profunda femoris	Preoperative lumbar sympathetic block with alcohol; obliterative endoaneurysmorrhaphy plus accidental ligation of superficial femoral	Persistent swelling of left leg
21	Common femoral	Quadruple ligation with excision of sac; required the ligation of profunda femoris as well as other collateral vessels	Foot became cool; sympathetic block produced increased temperature in the thigh but not in the foot; patient discharged with difference in temperature between right and left foot
30	Common femoral	Quadruple ligation with excision of sac; required the ligation of some collateral vessels	Lumbar blocks required to relieve postoperative pain in leg and foot
33	Common femoral	Preoperative sympathectomy; quadruple ligation; four collateral vessels ligated in order to remove fistula	Leg swollen, indurated and painful; no pulsation in distal vessels; patient had to stop smoking; elastic bandages were required to control swelling
T41	Common femoral	Obliterative endoaneurysmorrhaphy	Bluish discoloration of foot; edema worse on exercise
T42	Common femoral	Quadruple ligation and ligation of branches from sac	Persistent edema of leg
T48	Popliteal	Quadruple ligation and excision of sac	No dorsalis pedis or posterior tibial pulse; pain in leg and foot; area of anesthesia on foot

3. Four patients required sextuple ligations. These were cases in which the main artery with its venae comitantes was involved.

Restorative Procedures.—1. Eight patients were treated by transvenous arteriorrhaphy (Matas-Bickham) [8] or a modification thereof.

2. Two patients had small fistulous tracts which could be divided between clamps and ligated.

3. In 1 patient the fistula was excised and a venous graft with vitallium tubes was attempted, after the method of Blakemore and Lord.[5] The venous graft in this case proved to be too short, and a quadruple ligation finally was performed. In the statistical study this case was considered as a quadruple ligation and excision.

Intrasaccular Obliterative Procedures.—Seven patients were treated by means of a Matas intrasaccular obliterative aneurysmorrhaphy.[9] Although a transvenous repair was attempted in 2 patients, it was recognized at the time of the surgical operation that the artery had been obliterated completely. These cases therefore were included under obliterative procedures.

The significant results of this investigation are incorporated in table 2. The postoperative course of each patient was studied for evidence of vascular insufficiency subsequent to the surgical operation. To evaluate the effects of different surgical procedures on the arterial blood supply of the affected region, the following symptoms and signs were used as criteria of local circulatory insufficiency: (1) pain on exercise; (2) ischemia; (3) discoloration of skin distal to the fistula; (4) coldness of the skin distal to the site of the fistula as compared with the skin of the opposite side; (5) persistent lack of pulsation in vessels distal to the site of the surgical operation; (6) gangrene; (7) atrophy of muscles, and (8) recurrence of fistula.

Nine cases were eliminated from the statistical analysis because the fistula was intracranial or the restoration of the artery was not important for maintenance of an adequate blood supply to a part (e. g. ulnar, radial, occipital or temporal arteries).

ANALYSIS OF DATA

Of the 8 patients treated by a restorative procedure (transvenous arteriorrhaphy), none developed evidence of postoperative vascular insufficiency distal to the repaired fistula. On the other hand, 8 of the 29 patients treated by ligation procedures showed local vascular insufficiency, as did 5 of the 7 patients treated by intrasaccular obliterative procedures (table 2).

Analysis of these data revealed that the difference between the incidence of postoperative vascular insufficiency following ligations and obliterative endoaneurysmorrhaphy as compared with that following restorative procedures was statistically significant. The statistical analysis was carried out by the Chi Square (χ^2) method with the Yates modification for small samples.

COMMENT

The surgical procedures used in these cases merit a brief discussion.

Quadruple Ligation with Excision (fig. 1).—In the hands of most surgeons quadruple ligation with excision adequately cures the fistula and is a relatively safe procedure. It requires dissection around the sac and fistula with ligation and division not only of the main vessels but also of the collateral vessels that are encountered during the course of the surgical operation. Although this was the technic most frequently used in these cases with considerable success, there are certain definite disadvantages inherent in the surgical procedure. 1. It requires ligation of the main arterial pathway, which should not be performed unless it is absolutely necessary. 2. Dissection around the sac results in ligation of some collateral vessels which may be essential for maintenance of the flow of blood to distal parts. 3. The dissection of the sac is often time-consuming, requiring the ligation of innumerable bleeding points caused by increased pressure in the veins around the fistula. 4. It is not physiologic. 5. It is followed in many cases by evidence of postoperative vascular insufficiency.

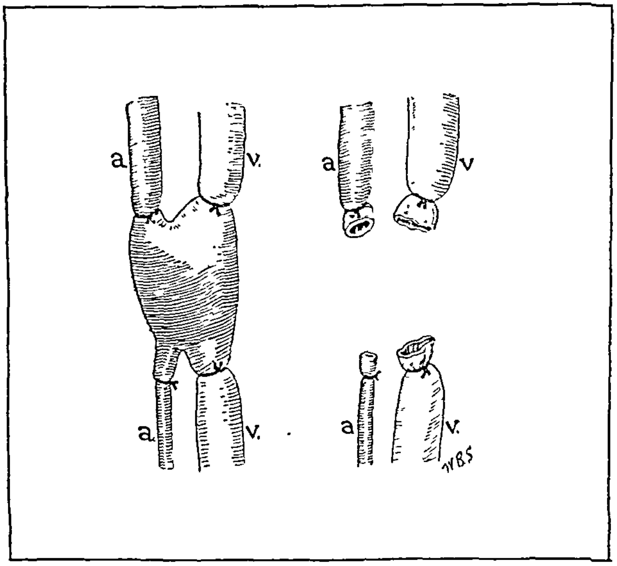

Fig. 1.—Quadruple ligation with excision of sac and fistula; *a*, artery; *v*, vein (in figs. 1 through 6).

Sextuple Ligation (fig. 2).—Sextuple ligation is a procedure required for an arteriovenous fistula which occurs between an artery and its two venae comitantes. It is fundamentally a ligation and excision operation with disadvantages which theoretically do not differ from those mentioned previously under quadruple ligation and excision. However, this technic is the only one of advantage in the presence of dual fistulas. A restorative procedure is usually contraindicated because too much of the arterial wall has been destroyed and because the caliber of the artery is ordinarily too small.

Transvenous Arteriorrhaphy (figs. 3 and 4).—Transvenous arteriorrhaphy can be performed easily if the fistula occurs in a region where the blood supply can be controlled either by a proximal constrictor or by temporary ligatures on the artery and vein proximal and distal to the fistula.

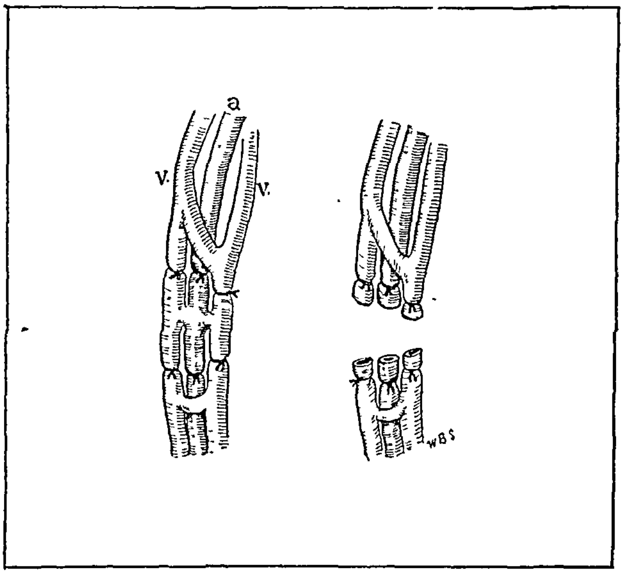

Fig. 2.—Sextuple ligation with excision of the dual fistulas and the involved artery with its venae comitantes.

The advantages of this operation are well known: 1. It preserves the main arterial pathway, which is especially important in certain regions such as those supplied by the common and internal carotid arteries and the popliteal artery. 2. It provides a rapid approach to the fistula, which can then be closed under direct vision. 3. There were no cases treated by a transvenous arteriorrhaphy in this series in which evidence of postoperative vascular insufficiency developed. 4. This procedure tends to restore the physiology of the

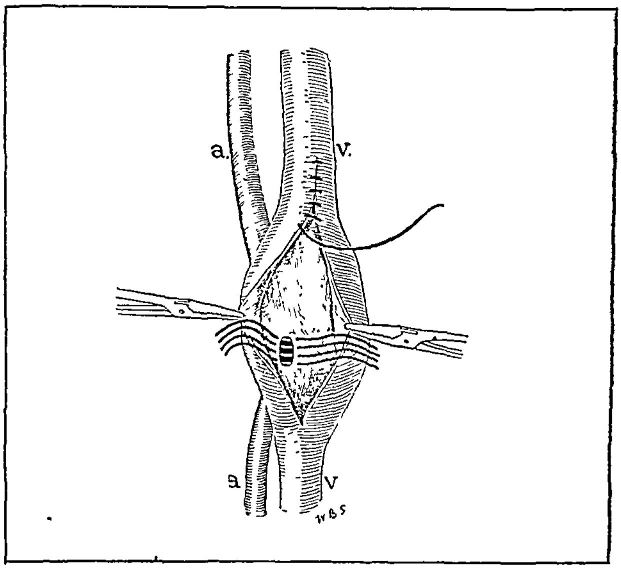

Fig. 3.—Transvenous arteriorrhaphy with closure of fistula and suture of the vein. Repair of the vein may lead to venous thrombosis with the danger of pulmonary embolus and is therefore not advocated.

circulation to normal. The disadvantages of this procedure stem chiefly from local factors that are present at the time at which the surgical intervention is done which contraindicates its use.

1. The procedure requires an arterial wall which has not undergone advanced pathologic changes. 2. A sufficient amount of arterial wall must be present to permit the closure of the fistula without causing a serious reduction in the lumen of the artery. 3. It requires control of circulation, which at times may be difficult or impossible to obtain. 4. Occasionally the repair of the artery will result in a decided reduction or even complete obliteration of the lumen with a diminished flow of blood to distal parts. This is a technical error, and every effort should be made to avoid it. 5. Should postoperative infection supervene, there is always danger of secondary hemorrhage. 6. Thrombosis or recurrence may follow this procedure in some instances.

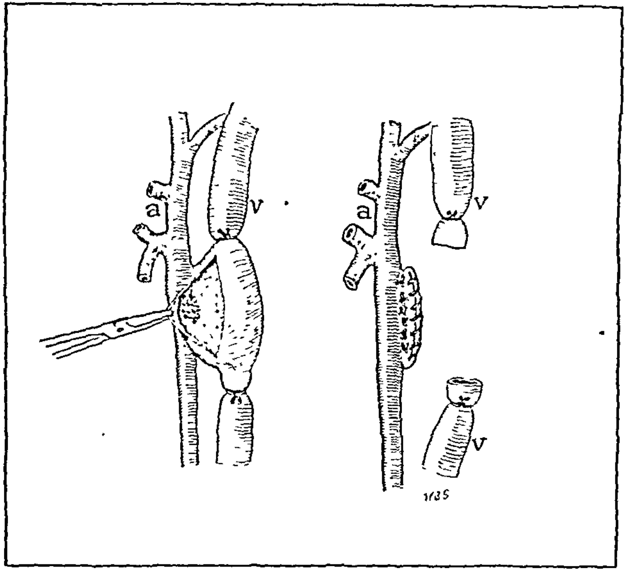

Fig. 4.—Transvenous arteriorrhaphy with closure of fistula by suture and obliteration of the vein. This eliminates the danger of venous thrombosis at the suture line and is the method we prefer.

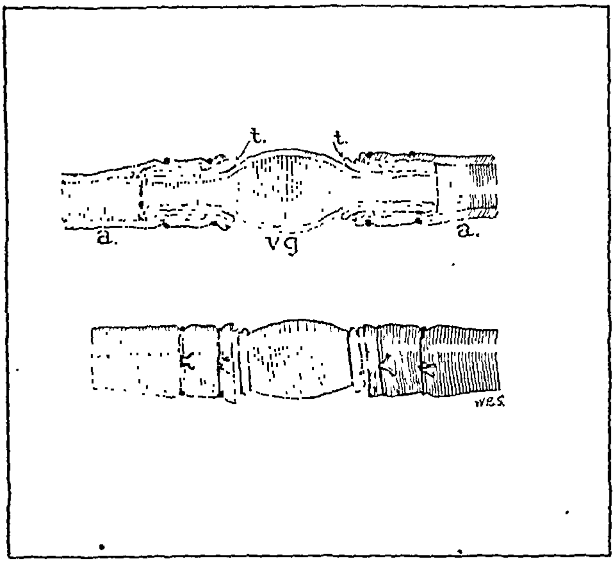

Fig. 5.—Vitallium tube-venous graft technic (Blakemore and Lord); *a*, artery; *t*, vitallium tube; *v.g.*, venous graft.

Vitallium Tube—Venous Graft Method (Blakemore and Lord).—The development of this technic (fig. 5) offers a new approach to the problem. The vein is cut and ligated proximally and distally. Then the intervening portion of the vein is excised with the fistula and the involved segment of artery is restored by means of two vitallium tubes and a venous graft.

This procedure is advantageous for the following reasons: 1. It provides for complete excision of the fistula and sac. 2. Despite the excision of the involved portion, the main artery is restored to function. 3. It is relatively simple and does not require suturing the blood vessels. 4. It is actually a combined quadruple ligation and restorative procedure, thus presenting the advantages of both.

The disadvantages of this method may arise from the fact that the dissection of the sac and fistula may seriously interfere with the collateral circulation. Because of this, vascular insufficiency may result if early thrombosis should occur in the venous graft.

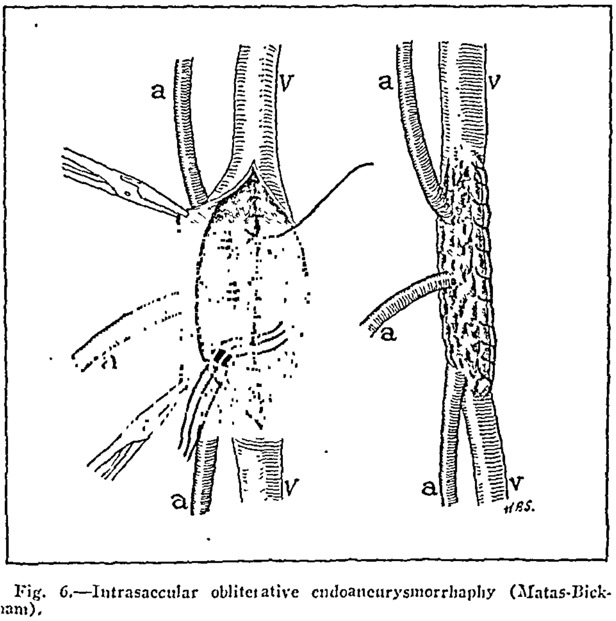

Fig. 6.—Intrasaccular obliterative endoaneurysmorrhaphy (Matas-Bickham).

This procedure still requires extensive clinical experience before it can be evaluated accurately. Blakemore and Lord, however, have reported remarkable results from its use in their civilian cases.

Obliterative Procedures.—Intrasaccular obliterative endoaneurysmorrhaphy (fig. 6), designed primarily for the treatment of true or false aneurysms, has also been used successfully in the treatment of arteriovenous aneurysms. It must be emphasized that this procedure requires adequate proximal control of circulation by a constrictor. It provides for direct entry into the sac with careful identification and suture of all openings, including those of the main artery and vein. The tourniquet is released to determine if all openings have been closed, and the walls of the sac then are folded into the cavity by sutures, completely obliterating the aneurysm.

The advantages of this procedure are as follows: 1. It cures the fistula. 2. It preserves the collateral vessels because no dissection is required around the sac. Figures 7 and 8 show how collateral channels are preserved by this method.

The disadvantages of this procedure are: 1. It obliterates the main arterial pathway. 2. It can be performed only in an area in which proximal control of circulation by a constrictor is possible. 3. The data derived from this series of cases indicate that this procedure is followed by a high incidence of vascular insufficiency.

Evaluation of Various Procedures.—It seems, therefore, that an accurate evaluation of the various surgical procedures used in the repair of arteriovenous fistula becomes difficult. Since no two cases are alike, an infinite number of variable factors present themselves at the surgical operation and often require individual consideration.

The most important of these factors can be divided into two groups depending on whether they contraindicate restoration of the artery or quadruple ligation.

The factors which prevent the use of arteriorrhaphy are usually local in nature. Such observations as scarring around the vessels, pathologic changes in the arterial wall, the presence of a false sac opposite the fistula and calcification in the wall of the aneurysm all preclude the possibility of restoring the main artery. Because these factors are relatively common, quadruple ligation with excision is performed in the majority of cases. On the other hand, if there is poor development of collateral circulation or if the fistula occurs in an area where the preservation of the main artery is vital (e g. the popliteal, carotid or brachial artery) quadruple ligation may be followed by serious complications. In such patients some type of restorative procedure is essential.

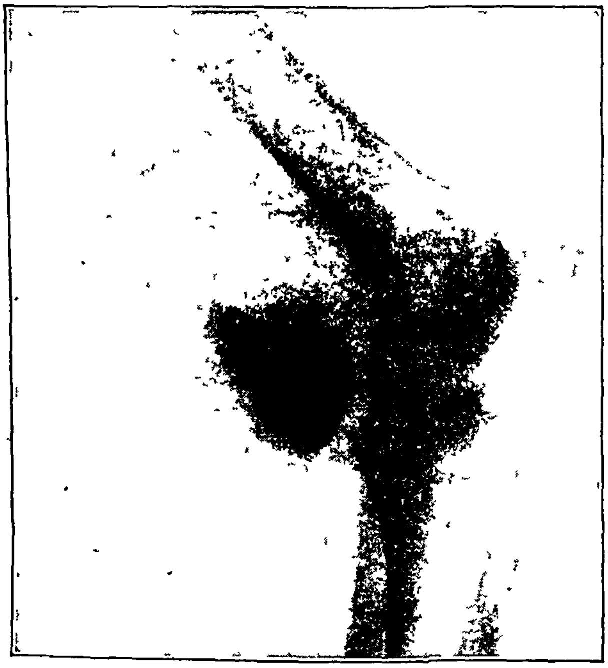

Fig 7—Demonstration of arteriograms taken in a case of Dr Urban Maes This is a syphilitic popliteal aneurysm, with the two main openings into the sac superficial to the deeply placed sac and the collateral vessels closely adjacent

The high incidence of vascular insufficiency following obliterative endoaneurysmorrhaphy was somewhat surprising since the surgical procedure is designed primarily to preserve the collateral vessels in close proximity to the sac. However, this can be explained on the basis that several of these patients were found to have extremely large sacs. In such instances there was so much damage to collateral vessels as a result of the large sac that any surgical operation other than preservation of the artery was likely to be followed by evidence of an inadequate flow of blood.

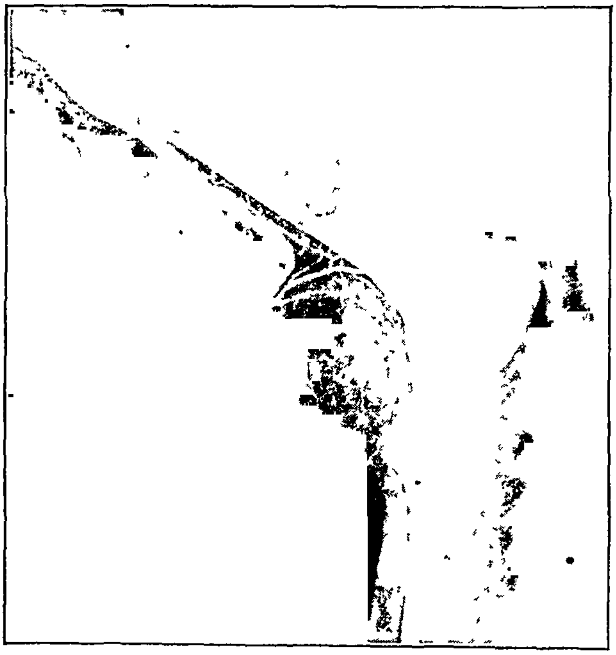

Fig 8—Conditions after a typical intrasaccular suture by the Matas method The largest collateral vessels emerge from the main trunk so close to openings into the sac that it would be impossible to ligate the vessels without destroying them In addition, numerous collateral channels have been preserved by this method because dissection around the sac was not required Although this is not an auriculoventricular aneurysm, these arteriograms are used to show the advantages of such an operative procedure.

Although the majority of the patients in this series were treated by quadruple ligation, a number of the surgeons in their operative notes explained in great detail why a transvenous arteriorrhaphy could not be performed. They invariably pointed out that the presence of some of the aforesaid factors contraindicated an attempt at restoration of the main artery.

There was 1 postoperative death in this group of patients, with a mortality rate of 1.9 per cent. The fatal result occurred in one of the early arteriorrhaphies because of surgical erysipelas and streptococcic septicemia. This in all likelihood could have been prevented if chemotherapy had been available at that time.

From the review of the literature and of the cases presented in tables 2 and 3 it would seem that there is no definite surgical procedure of choice for an individual arteriovenous fistula So many factors are involved in the decision as to what operation is suitable for each patient that the surgeon must be prepared to perform any one of a number of procedures. The decision usually can be made at the operating table when most of the local factors are visible It must be emphasized that each patient presents a highly complex and individual problem The statistical study indicates that restoration of the main artery must be the primary purpose of any surgical operation for arteriovenous fistula

SUMMARY AND CONCLUSION

In 53 cases of arteriovenous fistula three main types of surgical intervention were used: (1) ligation operations, (2) restorative procedures and (3) intrasaccular obliterative procedures.

Comparison of these three types of surgical operation on the basis of postoperative vascular competency and analysis of our data indicate that transvenous restorative procedures are followed by significantly fewer cases of vascular insufficiency than are any of the procedures which involve ligation or obliteration of the main artery.

The procedure of choice can be determined at the operating table when the local factors become apparent; the principal objective of the surgeon is to restore the original arterial pathway if possible.

There was 1 death in 53 cases, with a mortality rate of 1.9 per cent.

ABSTRACT OF DISCUSSION

Dr. Emile F. Holman, San Francisco: Surgeons must ever strive to be perfectionists, and it is apparent from these studies, excellent and critical as they are, that permanent ligation of the main artery to a limb is not a perfect or even a desirable procedure because of the risk not only of functional impairment but also of gangrene. It is obvious that restoration of the artery is imperative in certain instances, particularly in a "green" fistula or one recently incurred. Certain very helpful observations can be made at the operating table in determining whether or not the restoration of the artery is imperative. One of the main helps is the so-called Henle-Coenen phenomenon. The operation is begun without a tourniquet since full vessels are so much more easily identified and isolated than are empty and collapsed vessels. The vessels proximal to the fistula are isolated first, followed by isolation of the vessels distal to the fistula. Before attacking the fistula itself, the proximal artery is temporarily occluded to determine the state of the distal artery. If the distal artery is pulsating, it is proof that the artery can be permanently ligated and the fistula excised completely. If the distal artery is soft or collapsed it is obvious that the collateral circulation may be deficient, and under these circumstances one of the several methods of restoration of the artery as outlined by Dr. Heringman should be attempted. The transvenous approach to the fistula is very acceptable, except, of course, in a long-standing fistula where there is often pronounced sclerosis at the site of the fistula. I attempted such a local closure of the rent in the artery in 1 patient who had had his fistula twenty-five years. There was some sclerosis, although I did not consider that it was sufficient to preclude the suturing of the rent. However, there developed after the operation a very definite fusiform dilatation at the site of the closure—fortunately never productive of any disability.

Intrasaccular closure of the rent in the artery is also available on occasion and can be used to good advantage when the artery and vein open separately into the same sac.

Dr. Norman E. Freeman, San Francisco: Recent advances in the understanding of the physiology of the circulation have led to improvement in the treatment of lesions of the major arteries. During the recent war nearly 1,000 patients with wounds of the large arteries were treated in the vascular centers of the U. S. Army general hospitals. Only 3 cases of gangrene were encountered. Much credit for this remarkable achievement is due to the fundamental teachings of Matas. These teachings can be summarized in two sentences: 1. Time must be given for the development of collateral circulation. 2. The operative technic must be designed to preserve collateral vessels. Although the incidence of gangrene was almost negligible, interruption of the major artery to a limb may lead to persistent symptoms of impaired circulation. Dr. Heringman and his associates have clearly shown that surgical procedures which involve ligation or obliteration of the main artery are followed by significantly more instances of vascular insufficiency as compared with the number following repair. My experiences in the vascular center at DeWitt General Hospital are in agreement with the data of the author. Nine of 12 patients who had quadruple ligation and excision of femoral or popliteal arteriovenous fistulas found their activities restricted. By comparison, of 11 patients with similar lesions which had been treated by arterial repair, only 2 reported that their activities were limited by intermittent claudication. In the group of patients with excision, the oscillations at the ankle were only 0.75 unit, while in those with repair of the artery, the oscillations were 3.85 units. Although it is well known that the circulation may be adequate for tissue nutrition at rest even in the absence of palpable pulses, the preservation of pulsatile arterial flow through the major arteries is naturally to be preferred for muscular activity. Dr. Heringman has emphasized the fact that each patient presents an individual problem and that final decision can be made only at the time of surgical operation. Degenerative changes in the wall of the artery are the chief obstacle to its restoration. Important collateral vessels should never be sacrificed in order to mobilize the artery, since they alone may prevent gangrene in case the repair is unsuccessful. Improved function after successful repair offers a real goal toward which the aim of vascular surgery should be directed.

Dr. J. Ross Veal, Washington, D. C.: I would like to stress a point which has been overlooked so far; the use of sympathectomy or sympathetic nerve block following the interruption of the main vessels. This observation was first made by Dr. Gage of New Orleans. He found that the use of sympathetic block before and after repair of arterial aneurysms and arteriovenous fistulas caused a rapid development of collateral circulation. Soon after his report, I began to use sympathectomy in conjunction with the repair of arterial aneurysms and arteriovenous fistulas. There has been a remarkable improvement in the postoperative course of patients after sympathectomy. In cases in which I formerly had some dread of the possibility of the development of gangrene, it has been entirely eliminated. In those cases in which one cannot restore the lumen of the major artery I think an immediate sympathectomy should be performed. I feel sure that in the younger group of patients, such as those in this war, one can almost completely eliminate the postoperative deficiency of circulation by this procedure.

Dr. E. Craig Heringman, New Orleans: I would like to thank Drs. Holman, Freeman and Veal for their enlightening discussion of this problem. It seems to me that we need to establish some criteria for the choice of procedure. Certainly, with more attention being drawn to this problem, other men will find an increase in the incidence of postoperative insufficiency following quadruple ligation, with the result that we may be able to learn more about the problems involved in the choice of surgical operation. With reference to the question that Dr. Freeman raised, none of the cases of transvenous arteriorrhaphy showed any evidence of recurrence or of aneurysm. One recurrence followed an intrasaccular obliterative aneurysmorrhaphy. The question of sympathectomy before operation is an important one, and I think that Dr. Freeman recently reported a group of cases in the majority of which sympathectomy was performed. There were a number of sympathectomies in the present series that we reported. Several cases of quadruple ligation did show postoperative vascular insufficiency despite sympathectomy.

Number of Eggs of Flies.—In a research project being conducted at Rutgers University for the Army in which studies are being made on the raising of houseflies for experimental purposes, the greatest number of eggs deposited by one fly in one day, observed thus far in this work, was 162, and the greatest number for one fly during its life was 1,500 The longest duration of life for male flies observed has been 32 days and for females 41 days.—War Department Public Relations Division, Feb. 6, 1947.

OCULAR MANIFESTATIONS OF PSYCHOSOMATIC DISORDERS

DAVID O. HARRINGTON, M.D.
San Francisco

"Nearly half a millenium B. C., Socrates came back from army service to report to his Greek countrymen that in one respect the barbarian Thracians were in advance of Greek civilization: 'They knew that the body could not be cured without the mind. This,' he continued, 'is the reason why the cure of many diseases is unknown to the physicians of Hellas, because they are ignorant of the whole.' "

This quotation, the opening sentence in H. Flanders Dunbar's[1] book "Emotions and Bodily Change" is, in effect, a brief of a new approach in modern medicine.

Thus the psychosomaticist frankly admits that his theories are centuries old and effectively forestalls the frequent criticism that the concept of psyche and soma as a unity has nothing new to offer the medical world.

The age of medical specialization was inevitable because, in the modern world, Socrates' "ignorance of the whole" was inevitable. No human mind can encompass the whole of medical knowledge, and the place of the specialist is secure. But the tendency has gone too far, and the concept of psychosomatic interrelationships is a healthy attempt to foster a closer cooperation and understanding among the specialties and particularly between the psychologist or psychiatrist and the physician trained to think only in terms of organic pathology.

As Dunbar has so aptly put it, "psychic and somatic represent merely two angles of observation. Our understanding of disease rests on pictures taken from these two angles viewed simultaneously, united stereoscopically."

This resolution of the dichotomy "body-mind," using as it does the idea of visual fusion or stereopsis, should appeal greatly to the ophthalmologist, but there is little evidence that it has done so.

The concept of psychosomatic medicine has been enormously advanced by the experience of the second world war. Like Socrates, many young men have returned from military service with the realization that their previous thinking had been entirely too limited in scope. Many of these men were forced by the exigencies of military medicine to revert to general practice and to forget that they might be highly trained specialists in the morbidity of a single organ. Even those who worked in their own limited fields quickly discovered that a high percentage of their problems were neuropsychiatric or psychosomatic.

Sometimes an ophthalmologist or perhaps a thoracic surgeon attached as a Naval medical officer to a Marine regiment would live in such close contact with his troops that, unless he were of the most rigid mental makeup, he could not help but see them as fellow human beings rather than as a group of potential casualties. A short time spent on a board of censors, for example, is an illuminating medical experience. The flight surgeon in the confined atmosphere of a carrier or at a small advanced flight training school soon learned that he must know his fliers before he could successfully treat their illnesses. Many of these men profited by their enforced separation from their specialties. Others, unfortunately, spent most of their time complaining of their temporary dislocation from their accustomed way of thought.

However, in spite of the experience of the war, consideration and medical treatment of the organism in terms of organs still plays a dominant role in the medicine of the present day, and this is outstandingly true of ophthalmology.

Numerous authors have called attention to the prevalence of ocular signs and symptoms of psychogenic origin, but their articles have almost completely escaped the attention of ophthalmologists and, in fact, have been hopelessly buried in the literature under the headings of "neurology" or "miscellanea."

The past twenty years have shown revolutionary changes in the study and clinical application of psychology and psychiatry, but ophthalmologists have taken little or no advantage of these changes. In spite of an exceedingly rich field for investigation in psychosomatic problems they remain almost entirely out of contact with this vital stream of new knowledge.

Almost every ophthalmologist is familiar with the ocular manifestations of psychosomatic disorders which are to be discussed in this paper but, to judge from the literature, personal communications and personal observations of methods of diagnosis and treatment, few are aware of the significance of what they see.

It would be impossible to discuss, in one article, all the ocular syndromes of psychogenic origin. Certain specific ones will be considered, as follows:

1. Ocular manifestations of vasomotor disturbance
    (a) Amaurosis fugax
    (b) Migraine
    (c) Neurocirculatory asthenia
    (d) Central angiospastic retinopathy
    (e) Raynaud's disease
2. Glaucoma
3. Ocular manifestations of hysteria

It will be seen from this list that the majority of the disturbances to be considered fall into the first group. And, in fact, aside from the frank ocular neuroses and hysteria, a large number of psychosomatic ocular disorders derive secondarily from a primary inbalance of the autonomic nervous system. Glaucoma, as it is affected by psychic disturbance, is classified alone though it might well be considered within the vasomotor group.

The role played by emotion in the production of discharge from the autonomic nervous system and the resultant profound physiologic disturbance, especially in the cardiovascular system, are well known. Dunbar has no less than thirty-eight references to Cannon in her book and lists twenty of his articles in her bibliography. Most of these are concerned primarily with the effect of emotion on the autonomic system either directly or through the endocrine system. Mittleman and Wolff[3] have experimentally studied the simultaneous emotional and physiologic manifestations of affective states in persons in a standardized physical environment and recorded their cutaneous temperatures radiometrically. The affective states contained various degrees of tension, anxiety, quiet, embarrassment, irritation, anger, rebellion, inadequacy, insecurity, humilia-

tion, grief, depression, despair and excitement. They discovered that the fall in cutaneous temperature was greatest during periods of sustained apprehension. Patients with Raynaud's disease differed in no essential from other subjects except in the association of pain, cyanosis and pallor with a major drop in the temperature of the fingers. They concluded that, although vasoconstriction under circumstances of stress is usually a minor event in the reaction of the organism to life situations, it may acquire a pathologic significance in maladjusted subjects or in those reacting to life crises and in patients with Raynaud's disease.

Gifford and Marquardt[4] described a type of central angiospastic retinopathy associated with abnormal variations in cutaneous temperature, especially in smokers.

I have reported a large series of ocular disturbances associated with autonomic imbalance and vasoneurotic diathesis.[5] These were seen in great numbers in the armed forces and include central angiospastic retinopathy and retinopathy associated with Raynaud's disease. They were associated with abnormal reactions in the temperature of the skin and directly related to sustained emotional disturbance incident to military service.

Zeligs[6] has reported a series of identical cases of central angiospastic retinopathy as a psychosomatic study.

It should be obvious that vasospasm which is radiometrically measurable in the extremities in susceptible persons is capable of producing physiologic or even permanent pathologic changes in a tissue as sensitive to anoxia as is the retina. This is especially true when one considers the extreme vulnerability of the macular circulation. It should also be plain that the difference between the transient visual disturbance in amaurosis fugax and the permanent visual loss in angiospastic retinopathy resulting in hole in the macula is one of degree only. The mechanism of production is the same.

AMAUROSIS FUGAX

One of the commonest and most disturbing symptoms confronting the ophthalmologist is periodic, transient, "black-out," "dim-out" or fleeting amaurosis. In most cases it is either ignored or minimized. Often a new pair of glasses is ordered which, as a psychotherapeutic measure, may give temporary relief.

During the war this symptom was so frequently encountered in hospitals and dispensaries, both in zones of combat and in areas far removed from them, and was so obviously associated with unpleasant duty, anxiety, frustration and fear that the very term "black-out" became synonymous with desire for a change of duty. Many of these patients were accused of malingering, and undoubtedly some were guilty of conscious misrepresentation of their troubles, but I feel that in many instances the disturbance was real to the patient, and at times it was genuinely disabling.

On two occasions my clinic in a large hospital near Pearl Harbor was overrun with young Negro ammunition handlers from a nearby ammunition depot, most of whom suffered from this complaint. After careful ophthalmologic examination of a large number of these had been made with essentially negative results it was determined that in each instance there had been a minor accident in the depot the day before, and inquiry of the medical officer attached to the depot revealed that his list for sick call had more than trebled overnight. Further investigation showed that the psychiatric clinic was simultaneously crowded and that many persons with well advanced anxiety neurosis were seen. A number of the ophthalmologic patients were studied psychiatrically and showed evidence of severe and sustained tension and anxiety. A high percentage of these patients suffered from severe headache and orbital pain associated with their visual disturbance. Almost all of them showed definite evidence of vasomotor or autonomic instability.

Numerous instances of amaurosis fugax were seen in young junior officers. In a number of cases tactful questioning revealed a gradually decreasing efficiency, a clash of personalities with the superior officer to whom they were responsible and a visual disturbance precipitated by a poor fitness report submitted by their commanding officer. Evidences of emotional stress, anxiety, anger and vasoneurotic diathesis were outstanding.

The symptoms of amaurosis fugax vary from a fleeting dimness of vision which lasts only a few seconds to complete visual loss for a number of minutes at a time. Frequently the disturbance is associated with use of the eyes. Several naval aviators, grounded because of such attacks, explained that the visual disturbance was identical with that which they had experienced in a "pull-out" from a power dive. This latter amaurosis, which immediately precedes a transient state of unconsciousness, is known to result from drainage of blood from the cerebrum or retina or both into the large splanchnic reservoirs, due to sudden deceleration and the downward pull of gravity exerted on the upright body. The resulting temporary anoxia of the sensitive nerve tissue causes the familiar "black-out." In all these fliers there was strong evidence of emotional disturbance, usually anxiety, induced by failure to reach certain standards in their work. The condition became progressively worse in each case until a vicious circle was established in which increasing anxiety resulted in increasing symptoms. In at least 1 instance the symptoms were precipitated by suddenly increased responsibility incident to rapid promotion. In all cases the disturbance was cured by readjustments resulting in relief from anxiety.

Amaurosis fugax is, I believe, primarily vasomotor in origin with a retinal or cerebral anoxia precipitating the visual disturbance.

There is another type of temporary visual disturbance which is also psychogenic in origin but which is due to the production of a lenticular myopia of measurable amount. This condition, sometimes called "ciliary spasm," is thought to be due to spastic contraction of the ciliary body with resultant increase in the anteroposterior diameter of the lens. It is seen only in young persons, is immediately relieved by instillation of a mild cycloplegic drug and is always associated with emotional disturbance. The myopia may measure as much as 2 D., and visual acuity may be reduced from normal to 20/200 in a period of a few hours. A typical example is the medical student who is failing in his studies. As examinations approach he becomes more and more anxious about his grades and begins to study longer and longer hours. The resulting ocular and general fatigue increases his anxiety until finally his vision fails and examination reveals his spastic myopia. In each of 5 instances a readjustment of his curriculum by an understanding dean was sufficient to allay his fear of failure and restore ocular function to normal.

Considerable space has been devoted to the consideration of the relatively insignificant physiologic disturbance producing amaurosis fugax because its psychosomatic aspects can be so readily demonstrated. It is also felt that the condition differs only in the matter of degree from the much more serious and permanent changes seen in central angiospastic retinopathy, described later in this article.

MIGRAINE

Perhaps migraine does not belong in a paper devoted to the ocular manifestations of psychosomatic disorders. The visual disturbances associated with migraine are primarily cerebral in origin, but numerous authors have reported visible retinal vascular changes during attacks of migraine. I have for considerable periods of time observed 2 cases of severe migraine in which I could demonstrate easily visible vasoconstriction in the retinal arterioles during the aura preceding the attack and continuing on into the period of preheadache hemianopsia. In each instance there was overwhelming evidence of emotional instability, and in 1 case I was able to precipitate attacks almost at will by induction of an anxiety state.

Wolff[7] demonstrated that cerebral vasodilation associated with a sustained normal level of blood pressure caused symptoms to disappear in a subject with preheadache symptoms of scotoma, whereas a procedure that decreased cerebral blood flow caused the symptoms to become worse. From this he deduced that cerebral vasoconstriction was responsible for the visual defect. He expressed the opinion that the cause of the visual defect was not in the retina or orbit but within the cranial cavity.

Wolff[8] also showed that subjects with migraine demonstrated certain typical personality features and reactions, and it has been my experience that this is true.

The ophthalmologist has unexcelled opportunities to study migraine. Most of its sufferers eventually report to him for observation because of either the headache or the visual disturbance. In most instances they fully realize that their trouble is not ocular in origin but are hoping against hope that something may be done for them. Too often they are not even recognized for what they are and are fitted with another pair of glasses. A more careful analysis of the patients' symptoms and particularly of their history and personality pattern would reveal an emotional background in keeping with the vasomotor origin of the disturbance. Most subjects with migraine are overly conscientious. They accept responsibility but only at great cost to their peace of mind. They are apt to suffer from insomnia. Many have stated that they could predict an impending attack by a sudden and almost overwhelming burst of mental and physical energy. Unfinished work preys on their sense of duty.

There is always migraine, but during periods of stress its incidence and severity are enormously increased. Thus, during World War II medical officers in all branches of the armed service were confronted with great numbers of such patients, many of them completely incapacitated in their work.

A typical example of this was seen in a young Naval officer who had been promoted rapidly to a position of relatively high rank for his age and experience. He had had infrequent and rather mild attacks of migraine-like headache since childhood but had noted no preheadache scotoma. His record was excellent and he was known to be unusually hard-working and conscientious. When he was given the command of a new heavy cruiser he suddenly began to experience a severe type of migrainous headache, occurring at frequent intervals and associated with prolonged and virtually disabling preheadache scintillating scotoma and hemianopsia. His exaggerated sense of duty caused him to suffer great anxiety over the possible effect on his ship should he have these attacks at sea or possibly even during combat.

Though he fully realized that his excellent record of service would be marred and that he might even be retired as physically unfit for duty, he reported to his medical officer and requested to be hospitalized. Examination, including neurologic and ophthalmologic examination, revealed no abnormality except that during three separate attacks there was seen a rather pronounced localized spasm of a segment of the superior temporal artery of the retina. This same artery was normal in appearance between attacks and during the headache phase of an attack and showed a visible spasm only during the preheadache scotoma and hemianopsia. Psychiatric examination revealed a well defined but not severe anxiety neurosis.

Under relatively superficial psychotherapy and relief from tension by assignment to a new command involving less responsibility this officer was completely relieved of his migraine for a considerable period of time.

NEUROCIRCULATORY ASTHENIA

After a thorough review of the literature and a careful evaluation of the various theories and concepts of neurocirculatory asthenia, Dunn[9] concluded that the majority of patients with this condition show a psychologic disturbance. The condition should be classified with the psychosomatic neuroses. Neurotic traits are commonly found. Precipitating factors may be emotional strain, physical strain or infection, but the important causal factor seems to be anxiety, anger or guilt, accentuated particularly by military experience.

As was to be expected, the incidence of neurocirculatory asthenia was greatly increased during World War II. There were few medical officers who did not have experience with it whether they were cardiologists or regimental surgeons in the field, or whatever their specialty or duty station.

It was generally agreed by most of the medical officers with whom I talked that the classification of the disturbance with the psychosomatic neuroses was correct. Through the cooperation of a group of medical officers in a large overseas Naval hospital I had the opportunity of observing a fairly large number of patients with neurocirculatory asthenia from an ophthalmologic standpoint. A high percentage of these men showed evidence of a vasoneurotic diathesis. Most of them exhibited hyperhidrosis. A few, the cutaneous temperature of whose fingers and toes I was able to determine under controlled conditions, showed distinctly abnormal reactions. A high percentage had visual disturbances, without organic disease or refractive error. Many gave a history of amaurosis fugax. Two patients demonstrated a typical angiospastic retinopathy, and there were 3 instances of hysterical amblyopia. While I have been unable to find in the literature any report of ocular disturbance in neurocirculatory asthenia, my limited experience with this psychosomatic disorder would indicate that ocular symptoms of psychogenic origin are sufficiently common to aid in diagnosing the condition. This is particularly true in civilian practice, where the absence of a military *background would tend to obscure the precipitating causes.*

CENTRAL ANGIOSPASTIC RETINOPATHY

Horniker,[10] in 1929, and Gifford and Marquardt,[4] in 1939, described a lesion of the macular region of the retina which in their opinion was of angioneurotic origin and which the latter descriptively called "central angiospastic retinopathy." Both authors established evidence of vasomotor instability in their reports of cases and demonstrated the vasospastic causation of the retinal lesion. Both mentioned psychic trauma as a possible factor in precipitating the vasospasm but laid more stress on organic than on functional causation.

During World War II so many cases of central visual loss with macular edema, foveal pigmentation and hole in the macula were described by medical officers that a study of the condition was authorized by the National Research Council and was undertaken by Cordes,[11] in 1944. He correlated the data submitted by eleven Naval medical officers, including 16 cases under my observation, and concluded that, while the cause of the lesion had not been established, the survey seemed to "justify further study as to etiology, *giving special consideration* to possible peripheral vascular disease and angiospasm."

I have had an opportunity to study personally nearly 100 cases of central angiospastic retinopathy and have reported 40 selected cases.[5] In a number of instances studies of the peripheral vascular system were made, *and in all cases so studied there was definite evidence* of vasomotor instability. In a majority of the other cases the clinical evidence of vasoneurotic diathesis was so striking as almost to preclude the necessity of special vasomotor tests.

The various autonomic stimuli were found to be extremely active under wartime living conditions, particularly psychic trauma. The only constant factor in all cases of central angiospastic retinopathy was autonomic instability. It was concluded that "psychic trauma in a susceptible individual can produce as profound organic changes in connection with the autonomic nervous system as extremes of temperature, anoxemia or direct physical trauma."

The clinical entity of central angiospastic retinopathy begins acutely as a grayish edema of the macula which may vary from the faintest haziness of the macula with loss of foveal reflex to a disciform, sharply outlined, flat, serous detachment of the macula. As the edema subsides there is a redistribution of retinal pigment giving a mottled and irregular appearance to the macular area. Frequently there are numerous discrete, punctate yellowish dots around the fovea. The pigmentary disturbance is followed by a gradual loss of substance in the fovea and the development of a sharply outlined, punched-out, slightly irregular and usually minute hole in the macula.

Visual disturbance in the stage of edema is usually pronounced. This may be followed in the end stages by complete or partial restoration of central vision. There is frequently a permanent residual minute central scotoma, and the incidence of metamorphopsia is high. If used in the early stages vasodilators seem to be of definite benefit. The evaluation of planned psychotherapy, in the few instances in which it was possible to apply it, is difficult, but it seemed to be unusually effective. It must also be borne in mind that the mere fact of hospitalization of these patients was an effective form of psychotherapy. It was uniformly noted that the most complete recoveries were made by those patients who were discovered and hospitalized in the early stages of the disturbance.

At the same time that these cases were being studied ophthalmologically and autonomically, Zeligs[6] was studying a small group of similar cases of central retinopathy in another part of the world. He has recently presented his report of these cases as a psychosomatic study.

RAYNAUD'S DISEASE

Alkan[12] compared neurosis of the capillaries leading to Raynaud's disease to neurosis of the middle and small arteries leading to arteriosclerosis.

Whether or not this represents an extreme psychosomatic viewpoint the fact remains that most authors including Raynaud[13] are agreed that the disease most commonly occurs in young persons with hyperirritable nervous constitutions and that emotional factors are *primary among the causes of the disease and the attacks.*

While the occurrence of the clinical entity described by Raynaud is relatively uncommon, every student of peripheral vascular disturbance has encountered many varieties and degrees of peripheral vasospasm, some of which have been precipitated into typical attacks of Raynaud's disease. *For practical purposes these borderline* cases may be assumed to be identical except for the degree of intensity and duration of the spasm.

Several authors[14] have described attacks of intermittent constriction of the retinal vessels with blurring and even permanent visual loss.

I have reported 2 cases of typical Raynaud disease in both of which there was amaurosis fugax in the initial stages progressing to slight permanent visual disturbance and showing pronounced retinal arteriolar spasm.[5]

It is my opinion that varying degrees of retinal vasospasm may occur in cases which are essentially a pre-Raynaud syndrome and that psychic factors may play a primary role in precipitating the attacks of visual loss associated with true Raynaud disease.

GLAUCOMA

The importance of the psychic factor in glaucoma is recognized by every ophthalmologist. Many authors[15] have cited instances of psychic precipitation of single attacks of acute glaucoma, and almost every ophthalmologist can duplicate these case histories from his own records.

If it is assumed that attacks of acute glaucoma may be precipitated by psychic shock, is it not also possible, as suggested by Sussmann,[16] that the latent disposition toward glaucoma has its causal basis in the unconscious life?

More and more evidence is being accumulated to show the close relationship between the intraocular vascular circulation, the secretion of intraocular fluid, the level of intraocular pressure and their control by the autonomic nervous system. The susceptibility of the autonomic nervous system to emotional shock is well known.

In the light of present knowledge of the anatomic and physiologic connections of the autonomic nervous system with the higher cerebral centers through the hypothalamus, it is entirely logical to assume that this governing mechanism in the maintenance of a constant level of intraocular pressure, vulnerable as it is to psychic disturbance, may thus directly affect the delicate balance of the intraocular pressure.

Certain it is that there are many aspects of glaucoma which cannot be explained by the old mechanical theories of aqueous drainage.

I have recently studied 2 cases of chronic simple glaucoma which illustrate this emotional control of intraocular pressure.

A man 52 years of age complained of periodic dull ache in both eyes, occasional attacks of blurred vision and typical halos around lights. Examination revealed corrected visual acuity of 20/20 in each eye, but the tangent screen field for the 2/2000 isopter showed a baring of the blind spot at the upper pole in one eye and a double Bjerrum scotoma in the other. The heads of the optic nerves showed a moderate central cupping which was not diagnostic. The intraocular pressure was 28 mm. (Schiötz). The patient was apprehensive, nervous and easily annoyed by relatively slight deviation from his accustomed routine. It was decided to observe this patient without medication, and he was reexamined five days later after a week end at home during which he had been considerably upset by an overnight visit by his daughter and her two small children. The observations were the same except that the intraocular pressure was 35 mm. in the right eye and 38 mm. in the left eye (Schiötz). The patient was given a 1 per cent solution of pilocarpine for use four times a day, and the following Thursday the pressure in each eye had dropped to 20 mm. of mercury. On the next week end, under the same regimen, and again with the nervous tension induced by his grandchildren, the intraocular pressure in one eye had risen to 28 mm. of mercury and in the other to 32 mm.

For some time this patient was observed, and a close record was kept of his daily habits. On two occasions the miotic was discontinued, and the resultant rise in intraocular pressure, without emotional stimuli, was less than that seen while the patient was using the miotic but was subjected to relatively mild psychic stress. The patient himself was apparently completely unaware of any psychogenic factor which might affect his daily intraocular pressure curve, and most of the details regarding this were obtained from his intelligent and cooperative wife. With a realization of the effect of psychic trauma on this patient's glaucoma, a careful regulation of his way of life has effectively maintained, with a minimum use of miotics, a consistently normal intraocular pressure.

A much more dramatic instance of psychogenic causation in glaucoma is seen in the case of a 57 year old psychoneurotic woman who when first seen already had well advanced glaucoma, was almost blind in one eye and had broad double arcuate scotoma and nasal step in the other. The intraocular pressure on first examination was 60 mm. in the right eye and 52 mm. in the left (Schiötz).

The patient was almost hysterical in her attitude, at first refusing to allow her intraocular pressure to be measured. The heads of both optic nerves showed deep cupping with partial atrophy.

With the cooperation of a psychiatrist she finally consented to the use of miotics and at various times pilocarpine, physostigmine, prostigmine, carbamylcholine chloride and even di-isopropyl fluorophosphate were tried but without demonstrable effect on the pressure, which remained elevated to between 50 and 60 mm. of mercury (Schiötz). In the meantime the remaining visual field became rapidly reduced in size. The slightest exhibition of anxiety or pessimism on the part of the physician or her husband would produce a fit of hysterics which might last most of the night, and on each occasion the intraocular pressure would promptly rise from 10 to 15 mm. of mercury and then subside to the original level when the emotional outburst was over.

On the first mention of surgical intervention the pressure in the better eye rose to 70 mm. of mercury within a two hour period.

The emotional crisis precipitated when the patient was finally convinced that her choice was either operation or blindness was so severe that the condition approached an attack of acute congestive glaucoma, and it was necessary to perform a basal iridectomy with preliminary posterior sclerotomy and deepening of the anterior chamber by injection of isotonic solution of sodium chloride. Up to this time the patient had been undergoing active psychotherapy, which in the interim between attacks of hysteria seemed to have more effect in maintaining a minimum intraocular pressure than any other means at hand.

For approximately twelve days after the operation the intraocular pressure was normal. It then began to rise again until finally it was as high as before. There was practically complete absence of anterior chamber, and again the use of miotics and further psychotherapy were of no avail.

A second operation, this time an iridencleisis, was performed with almost identical results as with the iridectomy.

At the present time the patient is practically blind with a field of vision limited to about 1 degree at fixation.

While it is true that in this case psychotherapy was no more successful than miotics or surgical intervention, the striking observation was repeatedly made that emotional shock was directly instrumental in producing abnormal rises in intraocular pressure. The chronic psychoneurosis may well have been the chief causal factor in the original predisposition toward glaucoma.

It is not the purpose of this paper to advocate the thesis that glaucoma is a purely psychosomatic disorder or to prefer psychotherapy over all other forms of treatment in glaucoma. It is felt, however, that psychic trauma may be an important causal factor in many cases of glaucoma and that its recognition will eventually lead to a more rational and complete therapy.

OCULAR MANIFESTATIONS OF HYSTERIA

Articles on hysterical amaurosis, amblyopia, ophthalmoplegia, asthenopia and allied ocular manifestations of purely psychic origin are legion.

In some respects these conditions cannot properly be classified as psychosomatic disorders, and in any case it is not within the scope of this paper to recapitulate their endless variety.

In a review of the literature, however, several glaring fallacies repeat themselves so frequently as to demand correction or at least a challenge.

A vast majority of cases reported as hysterical amblyopia are diagnosed per exclusionem. After a thorough ocular examination has failed to reveal an organic cause for the visual loss the condition is labeled "hysterical" by virtue of the purely negative result. Seldom is any attempt made to determine in a positive sense the existence of hysteria. Psychiatric evaluation is rarely attempted except as a last resort in cases of extremely stubborn or prolonged and almost hopeless cases.

---

[16] Sussmann, R.: Psyche und Auge, Klin. Monatsbl. f. Augenh. **81:** 103, 1928.

The amenability of hysteria to suggestion is so well known as to need little comment, and the use of galvanic current, sham roentgen rays and anesthesia are repeatedly reported. I have been guilty of the use of sham spinal puncture to "cure" an hysterical amaurosis. The occurrence of hysterical amblyopia in children is much commoner than is generally supposed, and here the susceptibility of the patient to suggestion is particularly noteworthy. In 4 cases of visual loss in children under 14 years of age the rather exhaustive routine of a thorough examination of the eyes, in an attempt to determine the cause of the visual loss, carried so strong an element of suggestion that during the procedure the vision gradually improved and the diagnosis was thus established.

As has been pointed out by Janet[17] and Freud,[18] suggestion is the most important factor in the treatment of hysteria, and this applies equally to ocular hysteria. It must be remembered, however, that in the majority of instances a "cure" by suggestion is only transient.

It should be emphasized that hysterical anxiety with conversion phenomena is the manifestation of a higher psychologic mechanism. Unless this fact is recognized a rational therapy is impossible. The removal of the symptom of blindness (and this is all that suggestion can accomplish) may do more harm than good unless accompanied by effective psychotherapy.

There is hardly a sign or symptom of organic disease which hysteria cannot simulate. The more commonly encountered ocular manifestations of hysteria are amaurosis, amblyopia, photophobia, ophthalmoplegia externa and blepharospasm. Frequently several of these symptoms are seen in the same patient.

To establish a diagnosis of these symptoms as hysterical in origin one must, by proper psychiatric evaluation, establish the positive diagnosis of hysteria. To treat these patients rationally requires an exploration of the subconscious for an adequate explanation of the repression responsible for the symptom.

SUMMARY

The precision of diagnostic and therapeutic procedure available to ophthalmology has led to a conspicuous neglect of psychic factors in ocular disease.

That prolonged but reversible physiologic disturbance can eventually give rise to irreversible organic disease is no less true in the eye than in other body systems.

The following ocular manifestations of disturbed psychosomatic interrelationships are described and discussed:

1. Ocular manifestations of vasomotor disturbance
    - (a) Amaurosis fugax
    - (b) Migraine
    - (c) Neurocirculatory asthenia
    - (d) Central angiospastic retinopathy
    - (e) Raynaud's disease
2. Glaucoma
3. Ocular manifestations of hysteria

384 Post Street.

ABSTRACT OF DISCUSSION

Dr. George S. Campion, San Francisco: The presenting ocular symptom, as Dr. Harrington has pointed out, was a transitory "black-out" in an unusual number of cases. It occurred in periodic epidemics when personnel were to be dropped from classes in a technical training school for scholastic reasons. Personnel failing in a training course were shipped out immediately with a rating of seaman, second class, to get some first hand knowledge of the war, so that it was simple to understand the emotional disturbance which preceded the visual symptoms. Occasionally true migraine would show up in this group, often with the initial attack. The patients with migraine all had good grades up to a certain point and then dropped to the bottom of the class. The threat of failure then precipitated the attack. I saw 1 case of central angiospastic retinopathy in this particular group. I had first seen this patient three months previously because of bilateral acute contagious conjunctivitis, and I had difficulty getting him out of the hospital. He left quietly after two weeks and then came back with a corneal foreign body, which was removed. I went through the same procedure again, arranging for a "G. I. series" and a psychiatric consultation. The latter showed an anxiety neurosis not judged sufficient for a survey with a view to his removal from the service. He reported to duty again after several weeks, and a short time later returned to me with the complaint that his right eye had lost its vision that morning at about 11 a. m. He knew the exact time because he tested his vision twice a day! Examination revealed typical acute central angiospastic retinopathy. He received treatment with all the vasodilators which can be used with safety, including intravenous injections of typhoid vaccine and three sessions with the psychiatrist. The edema subsided in four days, which is the shortest time I have ever seen, but the macula was permanently damaged. The patient was a radio singer in civilian life, and I firmly believe that the attempt to make an aviation machinist's mate out of him caused him to lose the vision of one eye.

Dr. Meyer A. Zeligs, San Francisco: The role which psychodynamic mechanisms play in vasomotor diseases such as Raynaud's disease, migraine and retinal angiospasm, has not been too clearly appreciated by most practitioners. Dr. Harrington has shown how certain types of ocular disturbances, particularly amaurosis fugax and angiospastic retinopathy, have, in the light of psychodynamic principles, become more clearly understood and nosologically alined. Dr. Harrington has pointed out the dynamic relationship between psychic conflict and autonomic instability in patients with these types of ocular disturbance. My own experience in the Navy has borne this out almost exactly. Dr. Harrington and I had been studying these cases among Naval personnel simultaneously in different parts of the world. We later discovered that we had arrived at similar conclusions regarding the role of psychosomatic factors in such persons, particularly in cases of angiospastic retinopathy which had developed in military personnel under the stress of combat. These anxiety or fear states constitute the core about which subsequent psychosomatic reactions characteristically develop. I do not believe that the ophthalmologist can remain content to treat such patients merely by asking them to abstain from smoking or by prescribing some antispasmodic drug to be used when symptoms of retinal spasm occur, or to prescribe such treatment in cases of angiospastic retinopathy, after a central scotoma is already demonstrable and unmistakable organic changes in the retina are visible. Since the psychic disturbances of civilian life are, as a rule, slowly engendered and often date back to early life, persons with ocular disturbances of this type should be given the opportunity of a "preventive" psychotherapy in which defects of personality or neurotic conflicts are dealt with, even though those psychic disturbances may not, from an ophthalmologic standpoint, seem directly related to the presenting ocular disturbance.

Dr. Arthur J. Bedell, Albany, N. Y.: I will, at Dr. Harrington's suggestion, show you what central angiospastic retinopathy looks like. The slides are photographs of the fundus, showing preretinal edema in its various stages. At the onset there is a dark circle with a brilliant convex surface overlying the macula. As the edema subsides, the circle enlarges, until it finally disappears, leaving fine dots of deep pigmentation. This cycle of development was first reported by me in 1928. The cause of the disease is not established. The photographs are shown to supplement Dr. Harrington's excellent paper.

Dr. Walter S. Atkinson, Watertown, N. Y.: In the discussion of Dr. Harrington's interesting paper, it might be appropriate to report the observation of lenticular opacities seen in 3 cases after treatment with electric shock. As Dr. Harrington did not have time to present his whole paper, I do not know whether or not he refers to the type of case in which the treatment with electric shock is used. The lenticular opacities referred to were mostly subcapsular and in the superficial cortical fibers. The ages of the patients ranged in the second and third decades. Two had been examined by me prior to the treatment, and no lenticular opacities had been observed. Two have been under observation for over two years, and the opacities have not increased. The third committed suicide before any progress in the opacities was noted. Since no report in the literature has been found of lenticular opacities following treatment with electric shock, it might seem advisable to have an examination of the eyes with particular attention to the lenses prior to the treatment with electric shock and afterward.

BACITRACIN THERAPY

The First Hundred Cases of Surgical Infections Treated Locally with the Antibiotic

FRANK L. MELENEY, M.D.
and
BALBINA JOHNSON, B.A.
New York

In May 1943, while searching for evidence of bacterial antagonism in the bacterial mixtures to be found in badly contaminated accidental wounds, we discovered an aerobic gram-positive spore-forming bacillus which produced, in ordinary culture mediums, a powerful antibiotic agent with a wide spectrum of antibacterial activity. When it was found that the active principle was present in the filtrate of the bacterial culture and was nontoxic for laboratory animals, studies were begun on its concentration and purification for the purpose of applying it to the treatment of human infections.

The organism was found in the debrided tissue removed from a compound fracture of the tibia in a 7 year old girl by the name of Margaret Tracey. In her honor the new antibiotic has been named "bacitracin." The crude filtrate was found to inhibit the growth of hemolytic streptococci in the test tube and on blood agar plates. It was also able, when injected subcutaneously, to protect mice against 10,000 or more minimal lethal doses of hemolytic streptococci given intraperitoneally, clearly indicating its ability to diffuse through the animal body from the site of injection to an area of infection. The crude filtrate also was found to have an abortive action on certain local human infections, such as furuncles and carbuncles, when injected into the center of the lesion.

These preliminary observations encouraged us to make renewed efforts to obtain the active principle in a more concentrated form.

We called on Dr. Hans Clarke, professor of biochemistry, for assistance, and he assigned Dr. Herbert Anker of his department to the task. He was able to extract the antibiotic from the crude filtrate with butyl alcohol and obtain a preparation in an aqueous solution which was concentrated a hundredfold. When this was dried an amorphous, slightly yellowish powder was obtained. This hundredfold concentrate was also found to be nontoxic for mice, guinea pigs and rabbits and without any evidence of local irritation or systemic toxicity in man.

The antibiotic was found to have certain properties which have been enumerated in the preliminary report which appeared in the Oct. 12, 1945 issue of *Science*.[1]

Further chemical studies required the availability of a larger quantity of the antibiotic than could be produced in the laboratory. One of the commercial firms attempted to produce it on a larger scale but at once ran into production difficulties and after working on it for a year gave up the attempt. At that point another firm, the Ben Venue Laboratories of Bedford, Ohio, took up the problem and after six months preliminary study began to produce small test samples of active material. These lots varied considerably in color, solubility and toxicity, but it was found that they could be used in dilute solution and in ointment bases for the treatment of localized surgical infections. During the last three months a preparation has been available which is highly soluble and of low toxicity. This is now going through the final stages of pharmacologic testing, and it now seems safe to try it out, with caution, systemically on generalized infections.

This paper presents the results which have been obtained in a series of 100 surgical infections treated during the last three years. The first 6 infections were treated with the crude filtrate from the culture of the bacillus which produced the antibiotic. The next 30 infections were treated with the concentrated and partially purified product prepared in the laboratory of biochemistry by Dr. Anker. The remaining 64 infections were treated with material furnished by the Ben Venue Laboratories of Bedford, Ohio. The product has been steadily improving in potency, in solubility and in the decrease of its toxicity.

METHOD OF STUDY

One of us has pointed out in a previous communication the difficulty of evaluating any drug in the treatment of surgical infections, many of which respond satisfactorily to the surgical procedure or even resolve spontaneously without the use of drugs.[2] This is true with respect to the drainage of an abscess or the resolution of a furuncle. However, it can be said without great fear of contradiction that a drug is of value in the treatment of surgical infections if it obviates the need for surgical incision in a condition wherein it is almost invariably required to effect a cure, if it permits a less extensive surgical procedure than would ordinarily be required, if it definitely shortens the healing time or if it permits a primary closure or a secondary closure earlier than would customarily have been successful without the use of the drug. Sometimes it is difficult to be sure that the drug meets one or more of the criteria in any given case.

The effect of the drug is even more impressive if it can be demonstrated that the causative organism has been eliminated from the area of infection promptly

---

From the Department of Surgery, Columbia University College of Physicians and Surgeons, and the Presbyterian Hospital.

The work described in this paper was done under a contract, recommended by the Committee on Medical Research, between the Office of Scientific Research and Development and the Columbia University College of Physicians and Surgeons and since Jan. 1, 1946 under a contract between the Office of the Surgeon General of the United States Army and Columbia University.

2. Meleney, F. L.: The Difficulty of Evaluating Drug Treatment in Surgical Infections, J. A. M. A. **124:** 1021-1026 (April 8) 1944.

following the administration of the antibacterial agent. These criteria of the benefit of a drug in the treatment of surgical infections have all been met by penicillin and in a much more limited sphere by the sulfonamide compounds. These criteria have also been applied to the present series of cases of infections treated with bacitracin.

In some instances it has not been possible to obtain a culture of the causative organism, but for the most part a bacteriologic study has been initiated before the beginning of treatment and in many cases cultures have been taken frequently during the course of treatment. The results have been classified in a manner similar to that which was used for the study of penicillin in surgical infections, a report of which appeared in the November 1946 number of the *Annals of Surgery*.[3] The result was called "excellent" if there was a prompt and unmistakable response and a rapid resolution of the infective process within seventy-two hours. The result was called "good" if there was an unmistakable response to the drug over a longer period, generally a week or ten days. The result was called "questionable" if one could not be certain whether the infection might not have healed just as well without use of the drug. The result was listed as "no effect" if the infection went steadily on its way despite the use of the drug. The first two groups of results have been called favorable and the last two unfavorable.

Among the cases of surgical infections treated with penicillin and reported in the paper previously mentioned there were 142 cases in which patients received local treatment. The two series are not strictly comparable, although they cover a similar range of surgical infections. In both series the great majority of infections responded favorably, clearly demonstrating that both of these agents are of value in the local treatment of infections.

These are not selected cases. They represent the ordinary run of infections which are seen in any surgeon's office or in the surgical clinic of any hospital. The majority of patients were ambulatory, while some required hospitalization. The earlier cases of surgical infection were treated at the same time that similar lesions were being treated locally with penicillin. In many of these cases the lesion had been treated unsuccessfully with the sulfonamide drugs or with penicillin, and the organisms had been found to be either resistant or antagonistic to these drugs. It can be said that in the past year in our hands bacitracin has almost completely replaced penicillin in the local treatment of these infections, and yet a few of those in which bacitracin failed to effect a cure have responded to the subsequent administration of penicillin. These cases of infections occurred in 54 men and 46 women. Twenty-four patients were under 20 years of age, 32 between 20 and 40 and 44 over 40. Eighty-four infections were considered serious, and 16 were relatively minor. Seventy-five were acute, of less than thirty days' duration, 22 were chronic and 3 were acute exacerbations of a chronic infection. Twenty-nine infections had previously had some other form of treatment, while 71 were treated primarily with bacitracin.

Bacitracin was administered in two forms, one in an aqueous solution and the other in a water-soluble ointment base. The vehicle chosen was the one most suitable to bring the agent into closest contact with the infected tissues. Fifty-seven infections were treated only with the solution, 32 only with the ointment and 11 with both. Furuncles, carbuncles and deep and superficial abscesses received an injection of the solution into the center of the lesion. The first injection often caused a burning sensation which lasted a short while, but this was seldom as acute with subsequent injections. It was probably due in part to the increased tension of the inflamed area. There was never any evidence of local irritation or toxic absorption from these injections. If pain is encountered procaine hydrochloride may be added, for it does not inhibit the effect of bacitracin. Such open lesions as ulcers were generally treated with the ointment. The solution has the advantage of permitting injection into the inflamed tissue. The ointment has the advantage of longer retention of the active agent and its slower diffusion.

The aqueous solution used in these treatments was of varying strength. The earlier infections treated with the filtrate or the concentrate made in our own laboratories varied from 2 units to 400 units per 1 cc. The superiority of the most concentrated solution was demonstrated when 2 similar lesions in the same patient were treated, 1 with the 400 unit solution and the other with a 5 unit preparation. The commercial preparations were generally used as 10 unit or 100 unit solutions, and in the latter half of the study the stronger preparations were almost always used. The amounts injected varied from 0.1 to 5.0 cc., depending on the size of the lesion.

The ointment base is made up with 45 parts of Carbowax 4,000 and 55 parts of propylene glycol.[3a] These two glycols are mixed together and sterilized by dry heat at 140 C. for two hours. When they have cooled almost to the point of solidification the antibacterial agent is added. This base may be kept soft in the incubator and thus be ready for the addition of the medicament. This water-soluble base may be used as a vehicle for penicillin and the sulfonamide compounds as well as for bacitracin. The ointment should be kept in the ice box when not in use because the bacitracin will deteriorate after a few days at room temperature, but it will remain active at ice box temperature for six months or a year. This ointment base in these proportions melts at body temperature and when removed from the ice box spreads readily on fine meshed gauze or china silk, which is then applied to the lesion to be treated. In some cases the dressing has a slight tendency to stick to the wound surface. This may be obviated by overlaying the inner dressing with a layer or two of gauze impregnated with zinc oxide. It is possible that this ointment base may be improved by the addition of a small amount of Aquaphor[4] or a similar compound to the mixture, to minimize sticking and to prolong the action of the antibiotic, but the ointment as described is sufficiently satisfactory to warrant extensive trial. Since it is water-soluble, the medicament passes readily from the vehicle into the tissues in contact. Some of the vehicle is also absorbed, and whatever is left may be easily washed from the wound with a solution of sodium chloride.

The organisms obtained on culture of material from these infections were almost invariably tested for sensitivity or resistance to both penicillin and bacitracin. Careful records have been kept on all these cases, and the essential data have been transferred to summary sheets similar to those used in the study of penicillin mentioned heretofore.[3] The items that have been particularly studied and are reported herewith are the diagnosis, the duration of symptoms before treatment, the previous treatment, the duration, dosage and method of bacitracin treatment, surgical procedures, secondary methods when necessary, bacteriology (including susceptibility tests), clinical response and end results.

[4] Aquaphor (Duke Laboratories, Inc.) is a base consisting of 6 per cent of a group of esters of cholesterol (chiefly oxycholesterol) in an aliphatic hydrocarbon (petroleum) base.

PRESENTATION OF DATA

Diagnosis.—The list of surgical infections by name and the results obtained are given in table 1. The commonest lesion was the single furuncle, and it is seen that the results were all favorable. In every instance the bacitracin was injected into the center of the lesion with a sharp needle in 0.1 to 0.2 cc. quantities once a day for two to five days. The excellent results were for the most part abortive, the good results represent cases in which central slough had occurred that required separation. In the deep and superficial abscesses the infections were much more serious, with more necrosis of tissues and purulent exudate. They required larger doses (1 to 5 cc.) and a little longer to clear, but even so all the results were favorable. Sebaceous cysts and infected operative wounds had other factors which delayed their response. The cases represented in the minor categories are of interest, but the numbers are too small for us to be sure that they are entirely representative.

When the group is taken as a whole, the 88 per cent of favorable responses compare favorably with the 70 per cent obtained by the local use of penicillin in the similar but not entirely comparable group of infections reported previously.[3] These cases as a group may have been less serious than the series treated locally with penicillin.

The "Excellent" Cases.—Of particular interest in this study are the cases in which the bacitracin either gave a strikingly rapid response (a so-called "excellent" result) and those cases in which there was obviously no effect or in which it was of doubtful value. The 31 cases in this group seem to demonstrate clearly that this drug may be expected to stop promptly the progress of certain surgical infections. The substantiating evidence is both subjective and objective. A prompt response often surprised the patient either because of the sudden relief of suffering or the obvious difference between the behavior of the lesion so treated and that of one in some comparable previous experience. The physician's observation of certain of these cases was often rewarded by a prompt subsidence of swelling, redness and exudate or the rapid resolution of the infection, which he had expected would require an incision. While the experienced surgeon may recall particular cases in which infections have responded promptly to a surgical procedure, such cases represent the exception rather than the rule. It is perhaps the frequency of the prompt response to bacitracin which is most significant. A brief descriptioin of certain of these cases will illustrate these points.

One patient with a large indurated and inflamed abscess of the face and another with a deep abscess of the chest wall felt so much better after one injection that they did not think it necessary to come back the next day for treatment. On the third day when they returned the lesions were quiescent.

In several cases of furuncle, bacitracin seemed to hasten the separation of the slough, and frequently with the core out, the lesion would be closed the next day.

Three patients had a diffuse infection of the anterior closed space of the distal phalanx of the fingers, a condition almost always requiring incision. An injection of bacitracin directly into the anterior closed space caused a subsidence of the inflammation without any drainage in 2 of these, and in the other patient injection of the drug was made through a small opening in the skin where the infection was pointing. The finger promptly ceased to throb. The patient was told to soak the finger every two hours if it pained. Only one soaking was necessary. The opening sealed over during the night. A tiny drop of the pus came out next day when the seal was removed. A second injection of bacitracin was administered, and on the following day the swelling was all gone. In all 3 cases it is presumed that there was a minimal amount of necrosis and a maximum amount of cellulitis when the treatment was inaugurated.

TABLE 1.—*Results Obtained in the First Hundred Cases of Surgical Infections Treated by the Local Application of Bacitracin*

Diagnosis	Total Cases	Results of Treatment: Excellent *	Good *	Questionable	No Effect
Furuncle (boil)	16	8	8	0	0
Deep abscess	13	4	9	0	0
Superficial abscess	10	3	7	0	0
Infected sebaceous cyst	9	0	8	1	0

Ulcer of vulva	2	0	1	1	0
Impetigo	2	2	0	0	0
Miscellaneous (1 each)	8	3	2	1	2
Total	100	31	57	9	3

* Favorable results in 88 per cent of cases.

One of these patients was the son of the senior author. He was discharged from the Navy with six small ulcers on the legs, arms and buttocks. Culture revealed a hemolytic streptococcus which was susceptible to both penicillin and bacitracin and a coagulase-positive staphylococcus which was resistant to penicillin but susceptible to bacitracin. The multiplicity of these lesions gave the opportunity to compare the results obtainable with penicillin and bacitracin, and it was obvious that in every instance the bacitracin-treated ulcers lost their exudate and healed faster than did the penicillin-treated ones.

One patient was the son of a professor of bacteriology in one of the southern medical schools. He brought the patient to the office with an active infection around an ingrowing toenail. The excessive portion of the nail and its matrix were excised, and the wound was left open and dressed with bacitracin ointment. When seen two days later the inflammation had subsided and the wound was clean, and after two more days the wound had closed itself and looked as if it were healing by primary union.

Two cases of impetigo were treated by the removal of the crusts and the application of bacitracin ointment, with almost immediate cessation of inflammation and exudation.

Treatment of several patients with sties required nothing more than bacitracin solution dropped in the eye. One of them, however, received an injection into the center of the lesion. Incidentally, it may be stated that several cases of conjunctivitis due to staphylococci responded to administration of the drug within twenty-four hours. Bacitracin caused no irritation of the conjunctiva.

A number of serious infections above the danger line of the face which, if untreated, frequently go on to orbital cellulitis or cavernous sinus thrombosis promptly responded to the injection of bacitracin. This was particularly striking in the case of an abscess below the lower lid near the outer side of the left eye. There was an area of redness and induration pointing in a triangular fashion toward the inner canthus of the eye. Twenty-four hours after the first injection this pointing triangle had receded and the danger of invasion of the boy's cranium was past.

A patient who had swallowed a broken knitting needle three years previously, in an attempt to commit suicide, came into the hospital with the foreign body penetrating the abdominal wall. It was readily removed, and the wound was closed without drainage. A collection of seropurulent fluid developed, which was aspirated and yielded on culture a nonhemolytic streptococcus which was resistant to penicillin but susceptible to bacitracin. A solution of 2 cc. of bacitracin containing 100 units per cubic centimeter was injected into the cavity. The fluid did not reaccumulate, and it was not necessary to open the wound for drainage. The whole process promptly subsided.

Another patient came in for treatment of a deep abscess of the cheek which was about 4 cm. in diameter and contained a number of anaerobic organisms. The infection promptly subsided following aspiration of the pus and the injection of 100 units of bacitracin on two successive days. The swelling was all gone on the fourth day, and the need for surgical intervention was obviated.

There were several patients whose subungual abscesses responded when the undermined portion of the nail was removed and bacitracin in Carbowax ointment was applied. In these cases the infection did not spread any farther under the nail, and the complete removal of the nail which is usually required was unnecessary.

An infected sebaceous cyst of the cheek promptly subsided, and when the patient came in later for the removal of the cyst no evidence of it could be found. In several other cases it was possible to excise the cyst soon after the subsidence of the acute inflammation. In 3 instances it was possible to do a primary suture of the skin after the excision of the infected cyst and the wound healed by primary union in spite of the recent infection. Bacitracin was mixed with the procaine hydrochloride used for the local anesthetic in 1 of these cases.

In 1 case the donor site, five days after the removal of a dermatome graft, revealed a diffuse inflammation and an exudation all over the surface. Twenty-four hours after the application of bacitracin ointment there was no exudate and the surface was dry; healing progressed rapidly thereafter. Such an area permitted a satisfactory contact between the ointment and the infected surface. So much for the "excellent" results.

The "Questionable" Cases.—The 9 cases in which results were "questionable" include 1 of multiple furuncles of the axilla from which a mixture of organisms was cultivated, including Escherichia coli which was, of course, resistant to bacitracin. Proper contact of the medicine was also questionable in this old scarred lesion. Another was a case of varicose ulcer of the leg which repeatedly yielded no growth on culture but remained inert for months, the patient refusing surgical intervention. A third was an infected contusion and laceration with gangrenous skin and subcutaneous fat undermined with a mixture of organisms, including Esch. coli and a strain of Aerobacter. After the removal of the gangrenous tissue the wound healed slowly. A fourth was a case of multiple infected sebaceous cysts. Some of these subsided with bacitracin therapy, while others did not.

Two patients with multiple furuncles of the face did not obtain good results from the local application of bacitracin ointment. Some improvement occurred at first, and then it came to a standstill. There was improvement again after the substitution of penicillin ointment.

A decubitus ulcer over the tuber ischiadicum in a case of cord injury yielded on culture a mixture of a coagulase-positive staphylococcus, a nonhemolytic streptococcus, Proteus vulgaris, and an unidentified gram-negative bacillus. It was difficult to avoid pressure on this area. The ulcer gradually closed, and improvement was a little more rapid when 0.25 per cent parachlorophenol was added to the bacitracin ointment to minimize the activities of the gram-negative bacilli; however, the lesion did not completely heal during a period of six months' observation.

A chronic osteomyelitis of the ilium with a small draining sinus yielded on culture a coagulase-positive staphylococcus which was resistant to penicillin but susceptible to bacitracin and a Bacillus subtilis which was resistant to bacitracin but susceptible to penicillin. After the instillation of bacitracin the staphylococci disappeared from the culture; but P. vulgaris and Esch. coli both appeared in later cultures, and the sinus has remained open. There is probably bare bone at the bottom of the sinus, and healing may have to await the expulsion or removal of a sequestrum.

A chronic ulceration of the vagina yielded a mixed culture of organisms which were resistant to bacitracin, including a coagulase-positive staphylococcus, a hemolytic streptoccoccus and P. vulgaris. At first there seemed to be a favorable response to bacitracin therapy, but the improvement came to a standstill. It has recently responded better to a mixture of penicillin and parachlorophenol in the Carbowax base.

The Frank Failures.—In the 3 cases in which there was no evidence of favorable effect one finds a probable explanation for failure.

In the case of acrodermatitis continua of the finger which had been present over two years a staphylococcus was found which was resistant to bacitracin. A fungus belonging to the Mucor group gradually grew out from the culture. There was no response to bacitracin therapy.

In the second case a sacrococcygeal abscess, when cultured, revealed gram-positive and gram-negative pleomorphic anaerobic rods and a gram-positive anaerobic coccus, all of which were resistant to bacitracin. This abscess had to be opened thoroughly, and it then responded to dressings of zinc peroxide.

The third patient had a chronic osteomyelitis of the tibia. A previous lesion in the opposite leg, which had been successfully operated on some months before, had healed with the aid of bacitracin. A cavity of the bone with a sequestrum was excised, and bacitracin solution was applied on a silk tampon. The organism was susceptible to bacitracin, but a purulent exudate appeared daily in the wound and it was obvious that there was infection going on in the bone out of reach of the locally applied medicament. Bacitracin was not then available for systemic administration. Inasmuch as the organism was also susceptible to penicillin, the treatment was changed to the local and systemic administration of that antibiotic. Exudation promptly diminished, and subsequently a half dozen or more tiny sequestrums were separated from the surface. Granulations then grew up, and it was possible to successfully transplant skin grafts.

Duration of Infection.—When the cases are divided according to the duration of symptoms before the initiation of treatment it is noted that all infection treated in the first three days gave a favorable result, while the unfavorable responses began to creep into the groups with a longer history. These results are shown in table 2. In fact it is seen that in the first two categories the "excellent" results exceeded the "good," while even in the third the results began to be less brilliant. Most of the unfavorable results came in those cases in which the infection had persisted long enough for a breakdown of tissue or other physiologic disturbances or for secondary contaminations of the wound with resistant organisms to play a part.

The infections of 66 patients were treated for less than eight days, and most of them responded in that time. Thirteen were treated from eight to fifteen days and 11 from fifteen to thirty days. Ten received the antibiotic for a month or more.

With regard to total dosage, 60 received less than 100 units of the bacitracin. The unit has been established tentatively as that amount of bacitracin which can be diluted 1,024 times and still inhibit the growth of 0.1 cc. of a 1:100 dilution of an eighteen hour culture of our stock strain of hemolytic streptococci (representing about 1 million organisms) when planted in 2 cc. of culture medium. An adequate dosage of bacitracin for the control of any infection will vary with each case. It would seem reasonable to start with a concentration of 100 units per 1 cc. of solution or 1 Gm. of ointment.

Bacteriology.—The bacteriologic study of these infections is of particular significance. It is naturally of the utmost importance to determine if possible the bacterial flora of any infection or at least to make cultures before beginning treatment. In some cases this is either impossible or inadvisable, for example, in the early stages of a cellulitis or a furuncle or in a deep-seated infection. But when it is not done, the surgeon is working in ignorance of the pathologic agents with which he has to deal and of their susceptibility or resistance to the antibacterial agent he wishes to employ. Thus he cannot be sure which is the best one to use and may lose time in bringing the infection under control. Later cultures may of course reveal those organisms which have primarily resisted or have developed a resistance against the antibacterial agent employed, and appropriate measures can then be taken secondarily. But this is not the best method of treatment. The surgeon who attempts to treat infections without having the facilities of a laboratory at his disposal is working completely in the dark, depending on his experience and to a large measure on chance.

We regret that no cultures were obtained before the administration of bacitracin in 10 of these cases. Five of these infections were furuncles, 2 were sties, 1 was a deep abscess and in 2 there was faulty handling of the specimens. However, the results in these cases closely parallel those obtained in the group in which cultures were taken.

Table 2.—*Results of Bacitracin Therapy According to the Duration of the Illness Before the Initiation of Treatment*

		Results of Treatment

Pure	1	0	1	0	0
Mixed	12	4	6	1	1
Anaerobic bacilli					
Pure	1	0	0	0	1
Mixed	4	2	2	0	0
Culture not obtained	10	4	4	2	0

Of the other 90 cases pure cultures were obtained in only 43. In all the other lesions two or more organisms were present. The results are shown in table 3. It is of interest that only the coagulase-positive staphylococcus appeared more often in pure cultures than in mixtures. The gram-negative bacilli were always associated with other organisms. Not all the organisms found were necessarily pathogenic, but it is known that nonpathogenic organisms are of importance in preventing healing when they are in symbiosis with pathogens or are present in tissues which have necrotic elements or a deficient supply of blood. Furthermore they often have the power of inactivating penicillin. The well known producers of penicillinase do not inactivate bacitracin, and it is for this reason that the latter agent may be more effective in the treatment of mixed infections. Possibly some bacteria will be found which will inactivate bacitracin, but so far this has not been observed.

In tests of the recovered organisms for susceptibility or resistance to both penicillin and bacitracin it was found that most of the cocci were susceptible to both and a few were resistant to both, while a fair number were susceptible to one and not to the other. These results are seen in table 4. Where there was a difference it is apparent that the organisms were more often susceptible to bacitracin than to penicillin, thirty to six, to be exact, or a ratio of 5 to 1. This suggests that if these cases of surgical infection had all been primarily treated with penicillin instead of with bacitracin the results would not have been as good because fewer of the organisms would have been susceptible, and with the added factor of penicillinase production (without any bacitracinase yet demonstrable) the response to penicillin might have been somewhat less satisfactory. It is generally agreed that as time goes on more and more penicillin-resistant strains will be found which belong to species that are generally susceptible. This fact stresses the importance of discovering and developing as many new antibiotics as possible so that we will have many strings to our bow in the fight against infection.

TABLE 4.—*Susceptibility and Resistance to Bacitracin and Penicillin of Certain of the Bacteria Cultured from the Lesions*

Bacteriology	Bacitracin S. Penicillin S.	Bacitracin S. Penicillin R.	Bacitracin R. Penicillin S.	Bacitracin R. Penicillin R.
Hemolytic str......	4	2	0	0
Nonhemolytic str..	2	11	0	2
Coag.-pos. staph..	42	10	1	0
Coag.-neg. staph..	15	5	5	4
Anaerobic cocci....	10	2	0	0
Gram-neg. bac.....	0	0	0	8

S., susceptible; R., resistant.

It also emphasizes the necessity for a careful analysis of all the bacteria present in any given infection, including a test for susceptibility to a number of antibiotics and antibacterial agents, so that all the organisms active in the infection may be brought under control by the appropriate agent or combination of agents at the earliest possible moment.

At the same time the physiologic factors of general nutrition and local blood supply must not be neglected; any vehicle carrying the agents to the areas of infection, as well as the agents themselves, must be harmless to the tissues, neither directly injuring them nor interfering with their repair.

In many of these cases the response was so satisfactory that there did not seem to be any indication for taking cultures after the causative organisms had been determined. Therefore the time of disappearance of the causative organisms in these cases unfortunately was not known. In 22 lesions the same organisms which were there originally were later found on culture, but in most of these cases the activity of these organisms in the wound was definitely reduced or prevented, so that repair proceeded satisfactorily in spite of the continued presence of living bacteria. In 13 of the cases in which later cultures were taken the principal pathogen disappeared completely from the lesion following the local application of the drug.

In 62 of these cases the need for surgical intervention was obviated. Eighteen infections would unquestionably have required an incision before the days of the antibiotics. In all 88 favorable cases it was clearly evident that the healing time had been shortened.

SUMMARY AND CONCLUSIONS

1. In 100 cases of surgical infections treated locally with the new antibiotic bacitracin a favorable response has been evident in 88 per cent of the patients.

2. These cases represent the general run of localized or localizing infections which are seen every day in any surgeon's office or any hospital clinic.

3. The results have been classified as "excellent," "good," "questionable" and "no effect."

4. The excellent results are those in which the infections treated with bacitracin responded promptly within seventy-two hours, often surprising both patient and physician by the rapidity and completeness of their resolution. Certain illustrative cases in this group have been briefly reported.

5. Cases in which the response was unsatisfactory have generally revealed some explanation for the failure.

6. Bacteriologic studies showed that the majority of surgical infections were due to a mixture of organisms. Of all the organisms found only the coagulase-positive staphylococci were present more often in pure than in mixed cultures.

7. It is extremely important to make a thorough study of the bacteria present in any given surgical infection so that the most potent antibacterial agents may be employed as soon as possible.

8. Most of the aerobic and anaerobic cocci found in these infections were susceptible to both penicillin and bacitracin. Thirty were resistant to penicillin and susceptible to bacitracin. Six were resistant to bacitracin and susceptible to penicillin. A few were resistant to both.

9. None of the gram-negative aerobic bacilli that were tested were susceptible either to penicillin or bacitracin.

10. Bacitracin, like penicillin, will often obviate the necessity for a surgical procedure in certain types of surgical infections.

11. Bacitracin will be of clinical importance only if it can succeed where penicillin or the sulfonamide compounds cannot. Its activity against many organisms of the staphylococcic and nonhemolytic streptococcic groups, which are resistant to these agents, seems to be significant.

12. Furthermore, it is not locally toxic or irritating and is not inhibited by plasma, blood, pus or broken down tissue or by the organisms which produce penicillinase. It may therefore be of value in infections due to bacterial mixtures.

13. The search must be continued for other antibiotics which are nontoxic to the tissues and are potent against those bacteria not susceptible to treatment by the agents now available.

Special Article

HISTORY OF THE AMERICAN MEDICAL ASSOCIATION

MORRIS FISHBEIN, M.D.
Editor, Journal of the American Medical Association and Hygeia, the Health Magazine
Chicago

(Continued from page 613)

(Note.—*Following is the eighteenth chapter of a history of the American Medical Association, in process of development for publication in connection with the celebration of the Centennial of the American Medical Association in Atlantic City in June 1947.*

The general account of the history of the Association will be followed by individual histories of the various councils, bureaus, publications and other activities of the Association. The general account is written by the editor of The Journal. *Each of the other historical contributions will be by a member of the individual council, bureau or agency responsible and now associated with it or directly related to its work. Included will be photographs, signatures and a brief biography of each of the hundred presidents of the American Medical Association. This feature has been prepared by Dr. Walter L. Bierring.*

It will be impossible to publish all of the material in The Journal. *The complete work will be published in book form. It is hoped to have it available by the time of the annual session.*—Ed.)

CHAPTER 18. *Development of the Councils*

1905-1909

THE COMMITTEE ON LEGISLATION

For some time the Association had been served by a committee on medical legislation consisting of Dr. C. A. L. Reed as chairman and Drs. William H. Welch and William L. Rodman. The task of watching medical legislation in Washington and throughout the nation as well was far too great for a committee of this type. The committee had met frequently in Washington; it had established a national auxiliary legislative committee with 2,800 local correspondents. It had established also a national legislative council with representatives of the individual states to agitate whenever action was needed on medical legislation. The legislative council had not met in 1904 because there had not been questions of medical interest before the Congress. The Committee on National Legislation was, however, disturbed at this time because of an executive order issued by President Theodore Roosevelt concerning activities by public officials in their own behalf. This executive order read:

> All officers and employees of the United States of every description serving in or under any of the Executive Departments, and whether so serving in or out of Washington, are hereby forbidden, either directly or indirectly, individually or through associations, to solicit an increase of pay or to influence or attempt to influence in their own interest any other legislation whatever, either before Congress or its committees, or in any way save through the heads of departments in or under which they serve, on penalty of dismissal from the government service.

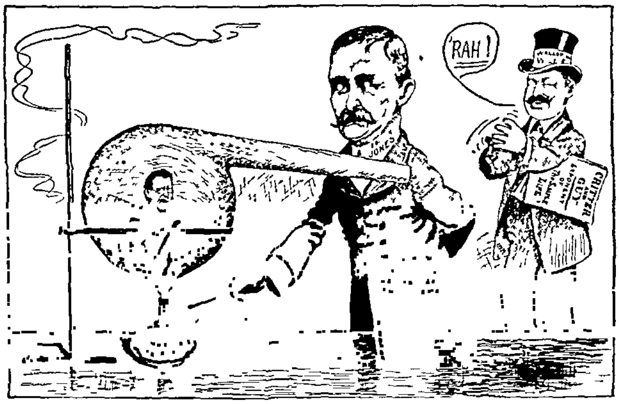
The legislative committee felt that there ought to be more doctors in the Congress and in the Senate. The expenses had been considerable. The committee proposed therefore that it be dismissed and that there be established a Bureau of Medical Legislation to be located in the Association building in Chicago. This bureau would act under the secretary of the American Medical Association and under the supervisory direction of a committee on medical legislation. The report of the committee was referred to a reference committee on medical legislation and political action. This committee concurred in the report. Thus the Bureau of Medical Legislation was established in the headquarters office.

MORE ACTION AGAINST THE PROPRIETARY DRUGS

Again the House of Delegates began to receive resolutions relative to the use of nostrums and proprietary remedies; these came from Missouri and California.

Following the introduction of these resolutions the Board of Trustees made its report. The Board announced to the House of Delegates that the Council on Pharmacy and Chemistry had been organized at a meeting held in Pittsburgh, February 11, with Dr George H. Simmons as chairman and C. S. N. Halberg as secretary. This council had been conducting its work much as it is now conducted up to the time of the annual session in June. Already it had exerted a considerable effect on the acceptance of "patent" medicines for advertising by The Journal of the American Medical Association. The report of the Board of Trustees was referred to a reference committee. The statement of that reference committee, of which Dr. Frank Billings was chairman, is significant. The reference committee said:

THE NIGHT BEFORE—"FAT FREE DIGITALIS"—SO CRUEL



Cartoon from the *American Medical Journalist*, March 1905. Part of the campaign against the formation of the Council on Pharmacy and Chemistry.

> The report of the Board of Trustees on the creation of the Council on Pharmacy and Chemistry is, in the opinion of your committee, the most important and effective measure ever undertaken by this Association to rid the profession of the abuse of the nostrum evil. The personnel of the Council is of such a character as to create a feeling of confidence that the proposed work will be done thoroughly, conscientiously and justly. The publication of the results of the work of the council in book form with annual editions will afford a source of information of inestimable value to the profession.
>
> Therefore we recommend that the House of Delegates indorse the action of the Board of Trustees in the creation of the Council on Pharmacy and Chemistry; that the Trustees be requested to devise a plan through which the Council may be made permanent, and that the Trustees request the Secretary of Agriculture of the U. S. government to give the Council on Pharmacy and Chemistry recognition by authorizing the Bureau of Chemistry to cooperate with the Council in its work

We indorse the work already performed by the Council on Pharmacy and Chemistry in the formulation of rules governing the mode of selection of articles to be investigated and the publication of results already obtained.

We recommend the publication in book form of a list of the preparations not in the Pharmacopeia that are approved by the Council on Pharmacy and Chemistry.

BUDGETS

The minutes of the Board of Trustees for its first meeting in 1905 indicate some of the internecine difficulties. Each time that the editor rejected an advertisement of some proprietary product that had previously been carried there came dire threats of recriminations. The Board of Trustees was, moreover, involved in the purchase of property, with the construction of a new building and with additions to the old building. A separate chapter in this history will be devoted to the story of the gradual development of the headquarters building.

Before the board were the budgets for the councils newly established; these gave much concern to the Board of Trustees in 1905. For instance, the Council on Pharmacy and Chemistry needed $3,000. The sum was granted but with some doubts; today the annual budget of that Council with its various associate councils and laboratory is more than thirty-five times the amount then proposed. The Board of Trustees gave full assent, however, to the rules of the Council relative to the advertising of proprietary products. Then it made the necessary appropriations for a secretary and for an assistant secretary of the Council on Medical Education. The budget of the Council on Medical Education at that time was $750 annually; this has gradually grown to reach more than fifty times the amount required during its first year.

PORTLAND SESSION

At the meeting of the Board of Trustees during the annual session in Portland, difficulties began to develop relative to the employment of the organizer, Dr. J. N. McCormack. The proposal was made to discontinue him as a salaried employee and to reimburse him with an honorarium for each day of service. Dr. McCormack objected to this arrangement and offered either to do the work for nothing or to continue it with the annual honorarium or to discontinue entirely. After reconsideration, the Board of Trustees moved that Dr. J. N. McCormack be reappointed to carry on the work of the Association until the next annual meeting at the same salary as previously.

Now came also for the first time the request to the Association to undertake the publication of a special periodical—the appeal being in this instance from the *Journal of Biological Chemistry*. In proceeding toward the publication of the new directory, the Board of Trustees authorized the purchase of the existing "Standard Medical Directory" for $6,000, and an option had been taken with payment of $750.

THE RUSH MONUMENT

The final and at the same time complete history of the Rush monument appears in the minutes of the House of Delegates for 1905. As has been stated, the turn in its affairs came when the names of Dr. Frank Billings of Chicago, Dr. L. Duncan Bulkley of New York and Dr. William L. Rodman of Philadelphia were added to the committee. They promptly increased its funds to more than $15,000. A site had been obtained for the monument, a bronze statue a little more than life size had been developed and purchased, and the unveiling and dedication took place on Saturday, June 11, 1904 at 5 o'clock. Dr. J. H. Musser, President of the American Medical Association, made a brief address, Dr. J. C. Wilson, chairman of the committee delivered a eulogy, and the President of the United States accepted the monument as a gift of the medical profession to the nation "in a graceful and interesting address." Music was by the Marine Band.

Much easier had been the collection of funds for a memorial to Dr. Walter Reed. Already more than $18,000 was in the hands of that committee.

THE DIRECTORY

When the Board of Trustees reported to the House of Delegates its action relative to the publication of a directory and its purchase of the "Standard Directory," a complaint arose from the Michigan delegation. At that time the most widely used and commercially profitable directory in existence was published in Detroit.

The report of the Council on Medical Education was well received by the House of Delegates. The members of that first council contained names such as might well command respect and admiration. It included Drs. Arthur Dean Bevan, chairman, William T. Councilman, Victor C. Vaughan, Charles H. Frazier and J. A. Witherspoon.

NATIONAL INCORPORATION

Many pages of the activities of the House of Delegates for this year are concerned with the attempt to incorporate the American Medical Association with a national charter. A bill had been introduced into the Congress for the establishment of such a corporation and had been favorably reported with the change, however, of the right to transact business anywhere in the United States to make it definitely a corporation of the District of Columbia. It was suddenly discovered that the amended bill was a very bad bill. Then Senator McComas of Maryland was induced by Dr. William H. Welch to bring out a bill still further revised. This bill was never reported out in the Senate. There was doubt as the constitutionality of such a measure. The committee which had the matter in charge says at one place in its report "This ends the first lesson in the attempt to secure national incorporation of the American Medical Association by a special act of Congress." In any event the report simply ended by referring the entire matter back to the Committee on National Legislation.

By this time Dr. J. N. McCormack was able to report that the plan of organization promulgated by the American Medical Association had been accepted by practically all the states of the Union except Virginia and Maine.

THE SITUATION IN NEW YORK

As a result of serious efforts by Dr. Frank Billings and Dr. J. N. McCormack, who had met from time to time with various representatives of the two medical societies in the state of New York, the time was approaching when New York would form itself into a single state society and become a constituent of the American Medical Association. Dr. E. Eliot Harris of New York reported to the House of Delegates that before the next annual session of the American Medical Association the medical profession of the state of New York would have united, and he asked that a committee be appointed to apportion a proper number of delegates to that state.

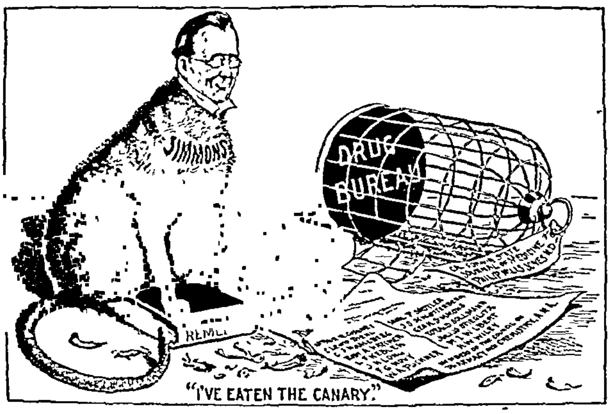
THE "PATENT" MEDICINE EVIL

By this time also many of the great literary publications of the United States, such as the *Ladies' Home Journal, Everybody's Magazine* and *Collier's,* had joined with the American Medical Association in the fight on the "patent" medicine evil. The House of Delegates tendered its thanks for their cooperation.

DR. J. N. MC CORMACK CONTINUED

As the meeting ended in 1905, a resolution was introduced by Dr. Jones of California asking that the present chairman of the Committe on Organization, Dr. J. N. McCormack, be permitted to continue with his work. Dr. McCormack rose in the House of Delegates and made a fine address in which he pleaded for unity and in which he said that suspicion of the trustees and the editor was wholly unwarranted; that all were working together for the best interests of the American Medical Association. By a rising vote Dr. McCormack was unanimously recommended for continuation in his work. As evidence of the intensive drive for increase of membership in the American Medical Association, Michigan increased in this year from 452 to 2,100 members, and Texas from 382 to 2,510 members.

THE MORNING AFTER—"BY-PRODUCTS"—HOW CRUEL



SIMMONS
DRUG BUREAU
CALIFORNIA STATE JOURNAL OF MEDICINE PHILIP MILLS JONES M.D.
REMED
"I'VE EATEN THE CANARY."

Cartoon from the *American Medical Journalist,* March 1905, refers to the establishment of the Council on Pharmacy and Chemistry instead of the Drug Bureau proposed by Dr. Philip Mills Jones.

At this session of the Association, on nomination by Dr. W. L. Rodman of Philadelphia and E. Eliot Harris of New York, Dr. William J. Mayo was elected unanimously to be President of the Association.

MEMORIAL TO DR. N. S. DAVIS

Through a letter from Dr. Henry O. Marcy of Boston a memorial was recommended for Dr. N. S. Davis; Dr. Marcy opened the subscription with the first hundred dollars.

A CHAIRMAN FOR THE HOUSE OF DELEGATES

Dr. T. J. Happel offered an amendment to the effect that the House of Delegates should elect a chairman from day to day with the idea of taking this burden from the President. The proposal was hissed. Again it was felt that this would be an implied criticism of the President, and the proposal was rejected.

THE FIRST OPERATION FOR GALLSTONES

At this meeting there was an exhibit of Mrs. Z. Burnsworth of McCordsville, Ind., who was the first person ever operated on for the removal of gallstones. The operation had been done by Dr. John S. Bobbs of Indianapolis.

1906

BOSTON

In 1906 the Council on Pharmacy and Chemistry came to the Board of Trustees with a proposal that it be supplied with a laboratory in the headquarters office.

THE CRIES OF THE WOUNDED

The meeting of the Board of Trustees in Boston at the time of the annual session in 1906 was an indication of the difficulties that are likely to besiege crusaders at all times and in every generation. The purveyors of "patent" medicines, the quacks and charlatans who were beginning to be damaged by the exposés published in The Journal of the American Medical Association and by the barring of their advertisements from the medical periodicals, the publishers, the editors and those financially interested in periodicals which were profiting by the publication of these advertisements, the owners of medical schools which were beginning to see their investments and their incomes threatened, and the publishers of medical directories who saw for their activities the handwriting on the wall began to seek legal and other means of forcing the Board of Trustees of the American Medical Association and its editor into abandoning their crusading projects. Now came requests from lawyers and from owners of proprietary medical industries and from other agencies for the right to appear personally before the Board to present their cases. Now began to appear also the publication in competing periodicals of articles devoted to vilification, insinuation and prevarication relative to the work of the American Medical Association. The Board of Trustees properly answered these various agencies when they appeared with a legal representative that their legal representative could deal with that of the Association. Others were simply told that investigations would be continued and that the facts would be published.

A headquarters was created for the Bureau on Medical Legislation. Preparations were made for the Council on Medical Education, for the new laboratory and for the Committe on Scientific Research.

The sum of $5,000 was appropriated to the California fund for the benefit of suffering physicians. It will be remembered that California had had either an earthquake or a fire—or both—at that time.

The Committee on Scientific Research was granted $483.28, as it was still conducting a small exhibit.

THE PRESIDENT'S ADDRESS

In the meantime Dr. Lewis S. McMurtry of Louisville, President of the Association, made an important address to the House of Delegates dealing with the affairs of the Association. By this time a pattern was beginning to be established: the address of the President at the Opening General Meeting was for the public and the medical profession and concerned the advancement of medical science. The President made an address to the House of Delegates at its opening meeting dealing with the work of the organization. Dr. McMurtry found it desirable to point out first to the House of Delegates that the Association was not conducted by either the President or the secretary or both but that the great power of the Association was concentrated in the Board of Trustees.

> Under our organization [he said] the Board of Trustees has sole charge of the extensive property and controls all the financial and business affairs of the Association. This Board also has sole control of the disbursement of all funds in carrying on the publications of the Association—to supply funds for standing committees, to direct scientific investigations—and can mold the policy of the Association at will during the interim of the annual sessions. The present prosperous condition of the financial affairs of the Association, the splendid position and high standard of The Journal and the efficiency with which the work of the several standing committees is being prosecuted all compose a superb tribute to the ability, good judgment and professional devotion of the present Board.

Fortunately for the American Medical Association the tribute presented by Dr. McMurtry to the Board of Trustees at that session could be repeated year after year to the gradually changing membership of the Board of Trustees. From time to time movements have been initiated to wreck the Board of Trustees, to disturb its activities and to bring about revolution in the Association through action on the Board. Perhaps it is a tribute to the good sense and good judgment of American physicians that even revolutionists who were elected to the Board, once they became familiar with its problems and responsibilities, became among the most effective of the workers in its membership.

Dr. McMurtry was disturbed also by the possibility that a trustee might be at the same time a delegate and also with the possibility that a member of the House of Delegates might be elected to the office of President or Vice President. He said:

> The Constitution, article 9, section 3, declares "No member of the House of Delegates shall be eligible to the office of President or Vice President." Such a protection of the interests of the Association against undue influence is so just, and the precaution is so necessary, that it needs no comment for proper appreciation. If such doubling of office in one individual is forbidden by the Constitution as to the President and Vice President, how much more essential is it that the same precaution should be prescribed and enforced as to the trustees, whose power and responsibilities are so much greater? I shall have occasion presently to allude to the attacks now being made on the Association's Journal and the Association's management. These attacks, which you will readily recognize as the result of sinister motives and altogether unjustified in fact, are directed toward work entirely within the control and direction of the Board of Trustees. As the strength and influence of the Association grows, and pressing evils are exposed and corrected, such attacks will naturally increase. Under such circumstances the Board of Trustees should command the confidence of the profession at large, all members of the Board should sustain the same relation to this House of Delegates, which selects them, and they should also be on the same footing with each other. Hence I would recommend that the Constitution be so amended that no member of the Board can occupy the double office of trustee and delegate.

Dr. McMurtry then turned his attention to the attacks that were being made on the Board of Trustees and on the editor. In response to these attacks he said:

> So long as the meetings of the American Medical Association consisted almost wholly of section work, with a large general session every day for the adoption of resolutions, with no systematic or persistent work along definite lines, the commendation of the medical press was generally and freely bestowed on the organization. But since the reorganization, when this House of Delegates was established and the membership has increased, and the power of a great organization comes to be intelligently directed toward improving the resources of scientific medicine and advancing the welfare of the profession by organization, certain interests have been interfered with, and the natural course of misrepresentation and abuse has been resorted to by the interests involved. First, and most naturally, The Journal, owned and controlled by the Association and ably edited and published under the direction of the Board of Trustees, was the object of attack and misrepresentation. For years publishing firms have grown rich by the patronage of the medical profession, and these same firms owned medical journals liberally supported by the profession. That the medical profession should own and publish a journal of its own, and that this journal should attain great popularity and influence, has provoked hostile criticism and misrepresentation. That this hostility, abuse and misrepresentation should be directed against the editor of The Journal is natural, since he is in the direct line of fire, and, from one standpoint, is the chief offender. That you may appreciate the ridiculous character of these charges, I would refer you to the leading editorial in the last issue but one of a New York weekly which has for years enjoyed the liberal patronage of the profession and which is owned by a wealthy publisher of medical books. The editorial is entitled "The American Medical Directory." After stating that the issuance of a medical directory by the American Medical Association is absolutely without excuse, although mentioning that the Medical Society of the State of New York had advantageously issued a directory of that state, the editor says:
>
> "The Editor-Secretary has also gone into the business of publishing medical books—he might as well drag the Association into the making of shoes. We do not know who authorized this venture—perhaps the managers will take us into their confidence at the Boston meeting in June—but, whether authorized or not, if the Association publishes books it should give them without price to its members."[1] Comment on this is unnecessary. The allusion to Dr. Simmons and the feigned ignorance of the fact that the publication of a medical directory was authorized by a vote of this House of Delegates at Portland last year shows the unfair methods and animus of the editor who wrote the lines quoted.
>
> But there is another interest which has been offended and which is equally unfair and far more abusive in its attacks on The Journal and the Association. This is the interest of the manufacturers of "patent" and proprietary medicines. This House of Delegates established a Council on Pharmacy and Chemistry, which, with the cooperation of the Board of Trustees, has secured the services of expert chemists and pharmacists to analyze the various nostrums and proprietary medicines in popular use. Many remedies, widely advertised under a plausible name, were found to be composed of cheap and familiar drugs and sold at a ridiculously high price. The Board of Trustees, by direction of this House of Delegates, excluded from the advertising pages of The Journal all preparations which did not make public with the advertisement the formula showing accurately the composition of the products advertised. Many of these manufacturers of proprietary medicines have grown rich, and they saw here a serious menace to their interests. Their avenue of assault is through the editorial columns of the medical journals they have subsidized, and their press committee has been very active of late. Here, as in the instance I have cited from the medical publishers, the editor of The Journal is made the special object of abuse and criticism. In the meantime, the editor's unpardonable offense is that he is doing his duty faithfully, as he is appointed to do, and at all times under the direction of this House of Delegates.
>
> The far-reaching labors of the chairman of your committee on organization, Dr. J. N. McCormack, which have done so much to build up this great organization, have likewise brought on that distinguished physician a goodly share of unjust criticism and abuse.
>
> These attacks on the Association, its work and its officers, abound with allusions to "clique" and "ring" in the organization, which "clique" and "ring" is alleged to be surreptitiously

---

[1] I would state that the weekly New York journal quoted here is not the New York Medical Journal, edited by that veteran medical editor and scholar Dr. Frank P. Foster.

and treacherously running the affairs of the Association. I know not to whom these epithets are intended to apply, but this I do know, that there is no officer or board or committee of the Association which is not directly created by this House of Delegates. Hence, if there be a clique or ring entrenched in power anywhere in this great organization, the responsibility for its existence rests on this House of Delegates and the means for its immediate destruction are in your hands. You represent a constituency of more than 60,000 physicians, and it devolves on you to discharge faithfully the trust you have assumed.

MEDICAL EDUCATION

For the first time the Council on Medical Education now recommended a year of college education before entrance into a medical school.

The Committee on Medical Legislation reported that it had dealt with a number of problems for the medical profession, most important of which were the establishment of a national department of health with representation in the cabinet, the army medical reorganization bill, the pure food and drug bill and the attitude of the postoffice toward nostrums. The Association gave its fullest support to the proposed legislation for a pure food and drugs act, which passed the next session of the Congress.

THE DIRECTORY

In making its report, the Board of Trustees devoted a special section to the new directory. The editorial work on this directory had been placed in charge of Dr. Frederick R. Green. On many occasions the Association had voted to establish a directory, but now for the first time that activity was becoming effective.

ORGANIZATION

Dr. J. N. McCormack reported for the committee on organization. Visits had been made to Minnesota, Oregon, California, Texas, Oklahoma, Tennessee, Illinois and Kentucky, with special meetings in North Dakota, Montana, Washington, Idaho and Arkansas. These trips and their results had been chronicled week by week and month by month in The Journal.

THE SCIENTIFIC EXHIBIT

By now the Association was holding its seventh scientific exhibit, and a loving cup was presented to Dr. Frank Wynn on behalf of the Board of Trustees.

THE REFERENCE COMMITTEE REPORTS ON THE BOARD

Following a highly favorable report of the work of the Board and of the secretary-editor by a reference committee, headed by Dr. Philip Mills Jones of California, there was an extended discussion in the House of Delegates. Then a motion was introduced from Michigan asking that a special committee be appointed to investigate the criticisms of the Board of Trustees and of the editor, that an auditing expert go over all the books and that an independent study be made of the work of the headquarters office. On motion this was laid on the table. Then Dr. Philip Mills Jones moved a reconsideration of the vote and after some preliminary discussion it was ruled that it could not be reconsidered.

MORE NEW PROJECTS

Again came a mass of resolutions on a variety of topics such as the control of ophthalmia neonatorum, resolutions in behalf of contract surgeons, insurance fees, relief for California sufferers, a resolution to send The Journal free to medical libraries, a resolution on cancer, a resolution for a national department of health, a resolution on the extermination of mosquitoes, for the establishment of a section on tropical medicine, and many similar subjects.

The Section on Ophthalmology had for the first time printed all its papers in advance of the meeting, a procedure which it followed for many years. Papers were not read but merely presented briefly and then discussed. This innovation attracted much attention and there was extensive discussion of the procedure pro and con.

When the delegates left Boston and the editor returned to his headquarters in Chicago, he found himself sitting on the lid of a boiling pot. Chief agitation came from the commercial interests already referred to, which had begun to feel themselves seriously threatened by the trend in the development of controls. The national pure food bill had passed. It was the first step toward protection of the public against nostrums. Time was to show, however, that advertising made futile any attempts to protect the public by listing of composition or claims made on labels. Not until 1938 were there to be laws which would effectively control false claims made in advertising which were responsible for most of the sales of nostrums and "patent" medicines. These new laws would eventually reduce quackery in the United States to an infinitesimal percentage of that which prevailed in the early years of the twentieth century.

THE MEDICAL RECORD ATTACKS

The *New York Medical Record,* which was at that time owned by the publisher, William Wood & Company, constituted itself the spearhead of the attacks on the Board of Trustees and on the secretary-editor. That journal published a series of editorials questioning the financial management of the Association, accusing the editor of exploitation for personal gain and accusing the Board of Trustees of political manipulation and of operation as a hierarchy. From Detroit came a letter signed by Dr. J. H. Carstens reciting some of the charges made in the *Medical Record;* from Detroit also in the person of Dr. Leartus Connor, one of the older wheelhorses in the advancement of the American Medical Association, came a defense of the Board of Trustees and of The Journal. When The Journal published the letter by J. H. Carstens, which was dated August 1, the editor submitted the letter to Dr. T. J. Happel, then chairman of the Board of Trustees. Dr. Happel's reply was restrained and quiet. His most effective sentence was "I agree with the Rev. Sam Jones in cases of such complaints, when he says that 'if you throw a brick into a crowd you can tell who has been hit, because he always makes an outcry.'" However, Dr. Happel submitted in detail a complete statement as to the expenditures of the Association, including the salaries of its editor and its business manager. He told why the trustees had refused to publish complete copies of the payroll. He gave the exact details as to the money paid to Dr. J. N. McCormack for his work in organization. He gave the detail of the problems involved in the printing of the Directory and he indicated why the Board of Trustees thought it desirable that there be established a reserve fund for the Association.

By the second issue in September the editor printed an extended statement on the friends and enemies of the American Medical Association. He listed four different enemies:

> 1. The Proprietary Association of America, which, it will be remembered, circulated most malicious and libelous attacks on the American Medical Association, sending these to the newspapers all over the country, and which in other ways did all it could to create a public sentiment against the Association. This was because the American Medical Association lent its influence and support to the efforts that were being made to enlighten the public regarding the frauds that were being perpetrated on it by the "patent" medicine men.
>
> 2. The so-called "ethical" proprietary medicine men whose products or methods would not bear investigation.
>
> 3. Those privately owned medical journals which were more or less dependent on the income received from the foregoing.
>
> 4. The firm owning and publishing a medical directory.

The editor had not thought it desirable to reply to the attacks that had been made, "but when members of the Association of years' standing, men like Dr. Carstens, whose sincerity, honesty and loyalty to the Association are beyond suspicion, write letters and ask questions which show plainly that they have been misled and have accepted as facts the vague statements and indefinite insinuations made by those who are interested in creating dissatisfaction and suspicion, and when falsehoods and malicious misrepresentations are being circulated by journals hitherto of good repute and standing, then it is evident that the time has come to state some plain truths in order that the members of the profession may know the facts."

In the September 15 issue of THE JOURNAL the leading editorial was entitled "The Medical Record: An Enemy of the American Medical Association." The editorial was a fiery indictment of William Wood & Company, publishers of the *Medical Record,* and of its editor, who in four editorials had attacked the American Medical Association, its officers and its activity. The editor pointed out that the subscriptions to the *Record* had been steadily falling off and the nostrums in its advertising pages steadily increasing. His editorial accused the editor of the *Medical Record* of insinuations and deliberate misstatements of fact. It accused him of malicious misrepresentations. It called attention to the manner in which minor medical journals joined their own shrill cries of graft, fraud and cliché to the statements of the *Medical Record.* The final point in the editorial was a quotation from the *Medical Record* to the effect that "at Boston a strenuous effort was made to get rid of the editor, and that so great has become the dissatisfaction with his administration that this endeavor might have been successful had the general body any voice in the management of the Association." Here in a single paragraph is the editor's reply—and it is good, strong language:

> This statement is unqualifiedly false, as all who attended the Boston session well know. There was an opposition, it is true, and a bitter one, but it was limited to the horde of nostrum venders who have been getting rich by humbugging and deceiving our profession, and to the owners or attachés of those medical journals nourished by the same brood, who allow themselves to be used as the mouthpieces and tools of proprietary interests. The Editor of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION knows full well that he is hated with a most intense hatred by these gentlemen and their allies, and that they would stop at nothing to secure his "dismissal," but he also knows, and knows thoroughly well, that the "management" was fully and completely endorsed by 95 per cent of the physicians at the Boston session and, for that matter, is endorsed by a like proportion of the physicians of the country who know the truth of what is going on.

The battle against the proprietary medicines had assumed strong proportions. Articles in defense of the policy of the Association were contributed by Drs. Frank Billings, Abraham Jacobi, Jabez N. Jackson and George Dock.

In its attack on the most vicious of the proprietaries manufactured by fly-by-night pharmaceutical organizations, THE JOURNAL reached out occasionally to pick off a product of some of the leading manufacturers. The campaign was beginning to be felt from the very bottom to the utmost heights of the medical profession and the associated industries.

In the meantime the quality of THE JOURNAL was continuing to improve steadily. Its councils were *rendering regular important reports. The attacks* on the American Medical Association being made in the public press were rallying physicians to its defense. Many a lukewarm member was becoming interested in the fight and getting ready to lend a hand on the side of righteousness. Surely this was the cleaning of the Augean stables. Nostrums, quacks, "patent" medicines, bogus medical schools, exploiting directories, unprincipled medical periodicals and commercially tainted manufacturers were being seized by the shovel and the pitchfork. The fierce light of publicity was illuminating the cleansing. The people were beginning to appreciate the sincerity of the profession which had as a fundamental motivation the continuous policing of its own house for their benefit.

There were occasional excursions as well into the quality of English in medical writing, the dishonesty of multiple publications of the same article in a variety of medical journals and of plagiarism of articles from foreign publications as well as domestic.

As 1906 came to its end, THE JOURNAL stopped to take stock of the fundamental motivations of the Association as they had developed in the previous sixty years. The American Medical Association had been from the beginning a delegated body. However, it had not really accumulated strength and importance until the reorganization. By the end of 1906 it could report 60,000 members of the constituent state associations and a House of Delegates truly representative of these members. By 1947 it was to report more than 130,000 members.

FUNDAMENTAL MOTIVATIONS

The American Medical Association had been organized primarily to raise the standard of medical education. Year after year by means of resolutions and by the efforts on the part of the medical colleges themselves there had been gradual improvement. However, the first really effective measure was the establishment of the Council on Medical Education and the beginning of regular publication year by year of the status of medical schools considered acceptable to the Council and of the extent to which the graduates of the medical schools were able to pass the state licensing boards.

One of the first questions to come before the preliminary convention in 1847 was the regulation of pharmaceuticals. Repeatedly such resolutions had come before the Association, notably in 1850 and in 1879, but *the establishment of the Council on Pharmacy and* Chemistry in 1905 and the persistent publication in

The Journal of the exact facts regarding the promotion of nostrums was the fundamental step in improving the quality of medical practice and in freeing the public largely from the hazard of "patent" medicines.

There had never been an official register of physicians, although the need of such a register was felt as early as 1847. A directory had been proposed in 1849. Commercial directories designed to exploit both the public and the medical profession had grown in response to the need. With the inspiration of Dr. George H. Simmons, the publication of an honest directory was undertaken by the American Medical Association. This biographic index maintained from day to day in the headquarters office is one of the greatest assets of the American Medical Association. In every war in which our nation has participated, the American Medical Association, has been the possessor of the official roster of the medical profession and has been the fundamental agency in providing our armed forces with a high quality of medical service. It has been invariably necessary for the full time officers of our military services to depend on the vast number of volunteers from the civilian profession to provide medical service during war.

The matter of the establishment of The Journal as the property of the Association was first proposed in 1852, when Dr. J. B. Flint of Kentucky proposed to amend the Constitution to provide for the establishment and maintenance of a quarterly journal. The gradual development of sentiment toward the publication of a weekly periodical, which culminated with the establishment of The Journal in 1883, has been traced in the preceding chapters of this history. The Journal has been the life-blood and the heart of the American Medical Association. Its earnings have paid not only its own expenses but those of the Association as well. Its surplus has been devoted to improvement in the quality of the publication, to obtaining a permanent home and printing plant adequate for the needs of the Association. It has been the powerful voice of the medical profession in raising the standards of medical education, investigating the preparations and composition of drugs and pharmaceutical preparations, compiling and publishing an official directory of the profession and supporting one campaign after another for the advancement of medical science and the provision of medical care to all the people.

1907

ATLANTIC CITY

When the Board of Trustees met in Chicago in its new building early in 1907, the first message was one from W. C. Abbott indicating that it was going to be necessary for the Abbott Company to sell bonds to the medical profession. Dr. Abbott wished to be relieved of any promises given to the Board of Trustees on a previous occasion. The board promptly moved that Dr. Abbott be notified that the Board would hold itself relieved from any agreements made between the Board and Dr. Abbott previously.

Many minor matters were discussed by the Board of Trustees: for instance, whether or not there ought to be an advertisement on the front cover of The Journal and whether or not discounts should be given to some advertisers, such as the owners of sanatoriums.

ADDRESS OF PRESIDENT WILLIAM J. MAYO

When the Board of Trustees met with the House of Delegates at the meeting in Atlantic City in June they heard Dr. William J. Mayo, then President of the Association, make a few apt remarks on the work of the organization. First he pointed out that it was a wise provision which placed the real responsibility for the conduct of the affairs of the Association on the Board of Trustees. He congratulated the Association on the work of Dr. George H. Simmons and he said "his courage and fighting for the best interests as a whole, often at a personal sacrifice, must commend itself to every right thinking man." Already, he pointed out, The Journal was being recognized abroad as a periodical of the highest scientific standards. As he ended this portion of his statement he said "and finally I must pay tribute to the Board of Trustees, not in the perfunctory expressions of one who is about to sever slight official connection with them, but rather as one who wishes to express his real appreciation of their wise control of the affairs of the Association, a control which has enabled the American Medical Association to become the largest and most powerful medical organization in the world." He emphasized the work of the Council on Medical Education and of the Council on Pharmacy and Chemistry. He indicated the battle that was going on between the medical profession and the insurance companies as to the fees being paid physicians for their examinations, and he concluded by recommending that a committee be appointed to consider measures for expediting the business of the House of Delegates.

By this time the Association had cleaned its advertising pages to such an extent that the Board of Trustees was able to announce that from that time on all proprietary medicines would have to be approved by the full Council on Pharmacy and Chemistry before they could be considered acceptable for advertising in The Journal.

Most extensive was the report on the publication of the Directory, which had been undertaken at a tremendous cost to the American Medical Association. It was recognized that this was a cost well justified by the importance of the Directory to the organization.

As it came to the end of its report the Board of Trustees emphasized that profits made in any one year must be held at least to some extent to meet lean years. The board said "The Journal has had a number of years of prosperity, but this cannot always continue, and the only safe refuge will be a strong reserve fund. Any talk about reducing the price of The Journal before you have placed it on a sound footing is folly. Its business interests should always be carefully guarded." The Board of Trustees was able to report, however, that even though more than $25,000 worth of advertisements had been refused, the total gain from advertisements during the year had been $3,000 over the previous year.

MEDICAL EDUCATION

This was the period when the Council on Medical Education was beginning its most fundamental work inspecting medical colleges and rating them. There were 160 medical schools; 82 had been rated above 70, 46 between 50 and 70 and 32 below 50. The Council condemned medical schools conducted solely for profit, night schools, schools designed to prepare students to pass state board examinations, quiz courses and many other abuses.

MEDICAL LEGISLATION

In the years that occupied the first decade of the twentieth century one of the most important committees in the work of the American Medical Association was the Committee on Medical Legislation. This had been under the leadership of Dr. Charles A. L. Reed of Cincinnati, who had a natural aptitude for such work. He had created a national legislative council which met in Washington, as has already been described, and it kept close contact with every measure of importance introduced into the Congress relating to the medical profession. It had established a Bureau of Medical Legislation in the headquarters office and it was seeking expansion of that agency and of its efforts.

COMMITTEE ON HYGIENE AND PUBLIC HEALTH

The Committee on Hygiene and Public Health of the House of Delegates was concerned with education of the public. The committee proposed a board of public education in the American Medical Association. Interviews with such leaders as President Eliot of Harvard, President Stone of the Associated Press and editors of several Philadelphia newspapers on the need for education of the public regarding medicine, disease and health were reported to the House of Delegates. The committee encouraged the delivery of lectures to the public in schools, colleges and forums. President Eliot of Harvard pointed out that Harvard Medical School had already begun a long course of lectures of this sort given to the public in Boston. The committee proposed to develop a series of pamphlets for education of the public to be sold at reasonable prices. This proposal led to the ultimate formation of the Council on Health and Public Instruction of the American Medical Association. Indeed, promptly following this favorable report by a reference committee, Dr. Alexander R. Craig of Pennsylvania introduced an amendment to the By-Laws for the creation of a board of public instruction on medical subjects.

REFERENCE COMMITTEES PROPOSED FOR EARLY STUDY

At this meeting of the House of Delegates a report was adopted to the effect that reference committees be appointed two months in advance of the annual session and that reports be referred to these committees early enough for consideration. The difficulty of handling the vast amount of work presented to the House of Delegates by the Board of Trustees and the various councils and committees is one that has not yet been suitably surmounted. Apparently the delegates in that day were seeking some sort of solution, but obviously that solution has not yet been found. The reference committee on this occasion, under the leadership of Dr. Philip Mills Jones of California, took occasion in its report to commend the Board of Trustees, no doubt as an answer to some of the criticisms that had been made in the previous year. Thus the reference committee said "Any organization or corporation transacting business can only be successful so long as its affairs are conducted in a careful and up to date businesslike manner, and it is with pleasure that we note the essentially thorough and businesslike manner in which the trustees have conducted the affairs of this Association. We believe that the statement of audit is sufficiently definite and comprehensive and to make public further and more intimate business details would be unwise and poor business policy."

When the section of the report dealing with the work of the Board of Trustees was read, an attack on the Board was opened by Dr. H. W. Coe of Oregon. He accused the Board of Trustees of selecting an auditor and said that the auditor ought to be selected by the House of Delegates. He objected to the listing of inventory as an asset. He wanted to know the meaning of the word "agents." Then Dr. J. W. Grosvenor of New York objected to an item called "sundries." He wanted to know what kind of boxes the American Medical Association was selling. He wanted to see a full copy of the payroll. Dr. M. L. Harris, speaking for the trustes, explained the meaning of the statements which had been questioned and apparently became a little annoyed because he ended his first statement with the words "the gentleman has no business ability or he would not ask such simple questions." At this point the President of the American Medical Association warned him, saying "Be careful, Doctor, what you say; be careful: you are reaching a dangerous point." Dr. Harris then proceeded to explain the meaning of the word "sundries" and of "boxes." After some discussion by members of the House of Delegates who were insistent that the report give every possible amount of information that might be wanted, the report was passed, and Dr. George H. Simmons was called on for a statement. He began as follows:

> During the last two years I have been accused of everything in the category from being a grafter to a swindler and everything else. Dr. Billings has been grouped with me. Members of the Board of Trustees have been grouped with me. There have been insinuations cast that are not pleasant.

He then continued to explain the technic of auditing the business of the association and stated that all representatives of the Association were bonded. He pointed out:

> There is not an item paid out at the office of THE JOURNAL that is not represented by a receipt, even if it is a nickel for the boy to pay his street car fare.

Incidentally Dr. Simmons became so sensitive on this point that he continued to sign vouchers covering the purchase of even a paper of pins until he retired in 1924.

When Dr. Simmons finished his speech, Dr. L. S. McMurtry of Kentucky moved that the House of Delegates tender a vote of confidence and thanks. This was seconded by Dr. Coe. Dr. Hubert Work of Colorado moved that the motion include the trustees, and the whole motion was unanimously carried.

Much debate in this House of Delegates concerned a suggestion to erect a monument in memory of Dr. N. S. Davis; the whole consideration was postponed for a year.

THE ARCHIVES OF INTERNAL MEDICINE

One of the most significant actions taken by the Board of Trustees at the session in 1907 was the decision to establish a magazine in the field of internal medicine. Some of the leading clinicians in the United States felt that it was desirable that a publication be developed in the field of clinical medicine. Here are such names as Frank Billings, Henry A. Christian, David L. Edsall, W. S. Thayer, Richard C. Cabot, George Dock and James B. Herrick. At the suggestion of Dr. William H. Welch, a committee including Drs. Joseph L. Miller, George Dock, William Sidney Thayer and David L. Edsall was established to report to the Board in October on the publication of such a journal. Dr. Welch suggested that these men should constitute the editorial staff in case the journal was agreed on. When the Board met again in October the committee made an extended report on the publication of such a periodical and suggested that Dr. Joseph L. Miller act as editor. The complete history of the Archives of Internal Medicine appears as a separate chapter in this history.

1908

CHICAGO

Dr. Joseph D. Bryant occupied the chair when the House of Delegates convened in Chicago in June. Dr. Bryant's presidential address to the House of Delegates complained that there was little for the President to do in the organization. He felt that in some manner the President ought to be more closely tied to the work, but he was much more grieved by the many complaints that had arisen in connection with the exposés of secret remedies and "patent" medicines, which had stirred a furor in the land. There were complaints that businesses were being destroyed, and these were falling on the President of the Association as well as on the Board and the editor.

THE SALARIED ORGANIZER

The Board of Trustees in its report to the House of Delegates felt that the time had come when the Association could and should dispense with the expense of a salaried organizer. Some $40,000 altogether had been expended in building the organization. In recommending discontinuance of the work, the Board said "The American Medical Association will ever owe Dr. J. N. McCormack a debt of gratitude for the great work that he has done in this special department." It recommended that he be employed in securing support for pure food legislation and the need of uniform state laws governing the practice of medicine before the legislators of the different states and as an educator of the public in medical matters.

PUBLIC INSTRUCTION

In this year came the first report of the Board of Public Instruction. This board had prepared an extensive outline of subjects on which the public was to be instructed, covering all the basic sciences, medical and preventive medical problems, and the history of medicine. The board proposed that lectures be provided throughout the country and that outlines of the material that was being extended to the public be included with The Journal.

Arrangements had been made to have the aid of the laboratory of the Public Health and Marine-Hospital Service for the work of the Council on Pharmacy and Chemistry.

The House of Delegates approved a vote of thanks to Hon. George B. Cortelyou, Secretary of the Treasury, "for the interest he had manifested and the active part he had taken in issuing a departmental order recognizing officially the American Medical Association and the work of the Council on Pharmacy and Chemistry, and for his efforts in furtherance of pure food and drug legislation."

THE MC CORMACK VALEDICTORY

In making the final report for the Committee on Organization, Dr. J. N. McCormack told of the work that he had done during the year. He had met with opposition and attack because he had carried the campaign against "patent" medicines and nostrums into the county and state societies, and his valedictory was as follows:

> It only remains for me to tell you that when I leave this platform my official connection with the Association is ended. For eight years I have been almost a stranger to my home and my family that I might serve you. My constant regret has been that my capacity for service was not greater. I want to urge on you that this work is in its infancy and that it must be continued year by year until the new generation of students, educated as I am pleading they shall be in these matters, have taken our places, if the profession is ever to obtain the full measure of its usefulness to itself and to the people. As a business proposition, on a very conservative estimate, I am convinced that my work has added indirectly hundreds of thousands of dollars to your revenues, but that is the smallest part of it, as will one day be known. At least two carefully selected men should be put in the field, and others should be added from year to year until the benefactions of this work are felt, not only by every doctor, but at every hearthstone in this great country—that is, until the profession is really organized.
>
> In conclusion I want to urge you to stand by our great file leader, Dr. Simmons, while he is conducting this reform work to its conclusion. After standing by his side for eight years, often when the result was in doubt, I have been able to know him as no other man ever can. He will make mistakes of the head in the future as he has in the past, but no one will ever be so ready to recognize and right them as he will. I know him, and you can trust him. And to each of you, my co-laborers, and the thousands of my friends you represent in cities, towns and country districts, may I now paraphrase the lines of the Scottish bard and say:
>
> "The Monarch may forget the crown,
> So lately placed upon his brow;
> The bridegroom may forget the bride,
> To whom so late he made his vow;
> The mother may forget the babe,
> So lately fondled on her knee;
> But I remember thee, my friend,
> And all that thou hast done for me."

When the report on the work of Dr. J. N. McCormack came from the reference committee, it refused to accept the section dealing with the discontinuance of Dr. McCormack as an organizer and recommended as a supplement that he be continued in addition to his duty as organizer.

At this meeting the House of Delegates established a council on the defense of medical research, and later in the session Dr. Frank Billings offered a resolution that the House of Delegates fully and heartily endorsed the work of Dr. J. N. McCormack and recommended the Board of Trustees to continue him in the same capacity for another year.

OPHTHALMIA

Significant in the House of Delegates also for some years had been the report of the Committee on Ophthalmia Neonatorum. This committee, under the chairmanship of F. Park Lewis, did a vital work in introducing the use of silver nitrate for the prevention of blindness throughout the nation.

SIGNED PAPERS FOR THE PUBLIC

For some time the House of Delegates debated in great detail the question as to whether or not papers for education of the public should be signed by their authors. The debate waxed so warm that the entire issue was recommitted to the reference committee for further consideration.

MISCELLANEOUS

For the first time appears the name of Dr. Arthur T. McCormack of Kentucky rising in support of the work of the Council on Pharmacy and Chemistry and calling on the state medical journals to support the Council in the advertisements that they published.

The American Medical Association cooperated in setting up an American committee for the sixteenth International Medical Congress. It agreed to cooperate with the American Association for the Advancement of Science. It endorsed the candidacy of Dr. C. A. L. Reed for senator from Ohio and again agreed unanimously that there ought to be a department of health in the United States government with a secretary in the cabinet. The decision as to whether or not articles for the public should be signed was left to the Board of Public Instruction. A resolution was adopted expressing confidence in and appreciation of the work of the editor.

1909

ATLANTIC CITY

When the Board of Trustees opened its considerations in 1909 it was confronted with another request from Dr. W. C. Abbott to explain his case. He appeared and explained for fifteen minutes. His explanation was referred to a committee of three for report in the following June.

At the meeting of the Board of Trustees in Chicago in 1908 Dr. T. J. Happel was succeeded as chairman of the Board of Trustees by Dr. William H. Welch. He remained, however, as a member of the Board. He was taken ill suddenly during the meeting of the Board in February 1909 and died in May of that year. He had been a member of the Board of Trustees for eleven years and its chairman for seven years.

THE ABBOTT PROBLEM

Dr. Abbott had met with the committee, which now reported to the Board that he be placed on the same basis as any other reputable firm in regard to advertising in THE JOURNAL. During this period he had conducted a campaign against Dr. George H. Simmons and the work of the Council on Pharmacy and Chemistry which left feelings of ill will that prevailed for many years.

MORE PRESIDENTIAL SUGGESTIONS

President Burrell was unable to attend the Atlantic City session in 1909, but he sent a special message to the House of Delegates with four specific recommendations involving the work of the Association. He recommended first that the President and President-Elect of the Association be invited to attend all meetings of the Board of Trustees and that the policies of councils and committees, such as those on Medical Legislation, Medical Education and Pharmacy and Chemistry, should be submitted to the Board of Trustees and approved before going to the House of Delegates or to the public. He recommended that expenses of travel of all members of committees and councils be paid by the Association. He deprecated the tendency of members of the Association to use political methods in influencing legislation—state and national—and he was opposed particularly to the placing of a representative in Washington. His exact words were:

> The employment of one individual to serve as a lobbyist in Washington or elsewhere is a mistake; it is the adoption of trade union methods and will sooner or later bring the medical profession into discredit.

Next he suggested for consideration by the Board the separation of the offices of editor and general manager and secretary of the Association. He felt that the limelight of public opinion had been turned on this individual and that it was wrong that he should carry that responsibility. This was not in any sense a criticism of his acts. Indeed, he felt that Dr. George H. Simmons was deserving of the highest possible commendation for his remarkable conduct of an extremely trying double office.

STATE MEDICAL JOURNALS

In 1899 not a single state association owned and published its own state journal. By 1909 nineteen states had developed state medical journals.

The Board of Trustees was able to report that the ARCHIVES OF INTERNAL MEDICINE had begun publication in January 1908 and that it had succeeded beyond expectation from the beginning.

Already it had been found that the headquarters building was inadequate to the growing needs of the Association, and the Board of Trustees had promptly contracted for a new structure. The board was proud to call attention to the fact that the previous ten years had been the most remarkable decade in the history of the organization. The circulation of THE JOURNAL had increased 500 per cent. The Association had now enlarged and outgrown one of the largest medical printing plants, and the assets had been increased to hundreds of thousands of dollars.

The Association had made comprehensive studies of medical education and had elevated standards. It had made itself felt in national legislation. It had laid bare innumerable frauds. It had begun education of the masses in general matters pertaining to medicine. It was stimulating scientific investigation by rewards and grants and by scientific exhibits. In concluding its statement the Board of Trustees called attention to the firm defense that it had been compelled to make against the torrent of ridicule and abuse from proprietary medicine interests.

MEDICAL EDUCATION

By this year the Council on Medical Education had held five annual conferences. It had established minimum standards for medical education and for preliminary education. It had begun to concern itself with the quality of the medical curriculum. As a result of its efforts there had been five important mergers of medical colleges by which nine medical schools had been replaced by four stronger ones. It presented a list of fourteen steps toward improvement of medical education and it had been exceedingly active in improving the quality of medical licensure.

The Committee on Ophthalmia Neonatorum made an extensive report indicating how effective had been its drive toward prophylaxis against blindness resulting from gonorrheal infection during childbirth.

There was an extensive report by the Committee on Patents, the Committee on Drug Reform, the Committee on the Memorial to Nathan Smith Davis, and the Committee on Uniform Regulations of Membership.

At this session the name of the Section on Cutaneous Medicine and Surgery was changed to the Section on Dermatology.

The reference committee which considered the recommendations of the President, Dr. Herbert L. Burrell, concurred in the suggestion that the President and President-Elect meet with the Board of Trustees. At this time occurred addition to the Constitution and By-Laws of the important provision which gave the Board of Trustees responsibility for supervision of the actions of committees constituted by action of the House of Delegates between sessions of the House. It was felt that the decisions as to the separation of the offices of editor and general manager and of the secretary were under the authority of the Board of Trustees.

COUNCIL ON DEFENSE OF MEDICAL RESEARCH

The Council on Defense of Medical Research, which included such distinguished names as Walter B. Cannon, chairman, Simon Flexner, David L. Edsall, Harvey Cushing, Reid Hunt and J. A. Capps, reported regulations that it had adopted regarding abuse of experimentation and against misconceptions of its conditions and purposes and concerning the dissemination to the public of the tremendous advances that had been made with the use of animal experimentation.

Incidentally, in the establishment of the Section on Dermatology it was made clear that the subject of syphilis belonged to dermatology and not to urology.

Clinical Notes, Suggestions and New Instruments

STREPTOMYCIN IN PULMONARY TUBERCULOSIS IN CHILDHOOD: RESULTS IN FOUR CHILDREN

HEYWORTH N. SANFORD, M.D.
and
DONALD E. O'BRIEN, M.D.
Chicago

In January 1944 Schatz, Bugie and Waksman[1] first described a new agent, streptomycin—a substance exhibiting antibiotic activity against gram-negative and gram-positive organisms. Shortly following this first publication, they showed that this drug had definite inhibitory effects against Mycobacterium tuberculosis in vitro.

In controlled experiments Feldman and Hinshaw[2] demonstrated that streptomycin would protect guinea pigs against tuberculosis. In animals which were infected, lesions were shown to heal under streptomycin therapy. Even in animals that showed no gross lesions at autopsy, Myco. tuberculosis could be recovered from the spleens, and it appeared that streptomycin had a suppressive rather than a sterilizing effect. In 39 per cent of their series, the tuberculin test was reversed from positive before treatment to negative following treatment. In a recent report from the Mayo Clinic on a series of 34 cases of tuberculosis treated with streptomycin, Feldman and Hinshaw[3] have made certain further observations which would indicate that the drug has some value in the treatment of tuberculosis in man. As they have stated, it is too early and the cases studied have been too few to warrant any definite conclusions.

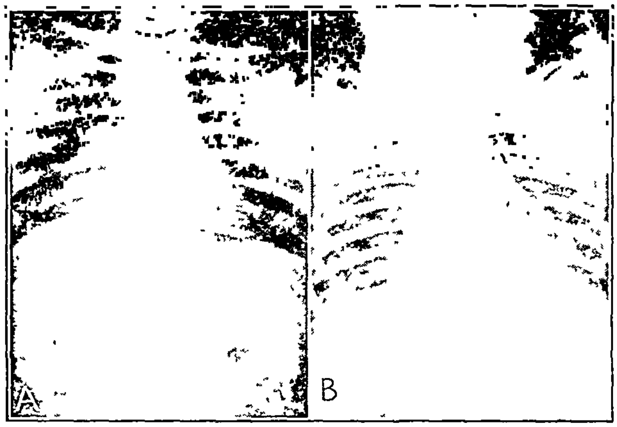

Fig. 1 (case 1).—*A*, fine granular appearance of markings throughout both lungs with a dense cloudy area in right cardiophrenic angle; miliary tuberculosis *B*, after thirty days' treatment with streptomycin the roentgenogram shows considerable clearing over previous films.

Apparently, early, fine, pulmonary lesions respond much more favorably to streptomycin therapy than old, fibrocaseous lesions, as indicated by roentgenologic and sputum studies. From three to six weeks was the earliest that any definite resolution could be observed in the roentgenograms of the chest. When treatment was discontinued, in a few instances reactivation of the process was noted.

During the past seven months we have treated 4 children with early pulmonary tuberculosis of the childhood type with streptomycin. In none of these children did we observe any serious toxic reactions to the drug. The only reaction observed was in the youngest child (aged 7 months), case 2, who had fever and a local reaction consisting of hyperemia and swelling at the site of injection after sixteen days of treatment. The treatments were discontinued for one week, and on their resumption no reaction of any kind occurred; the treatments were continued until the thirty day course was concluded.

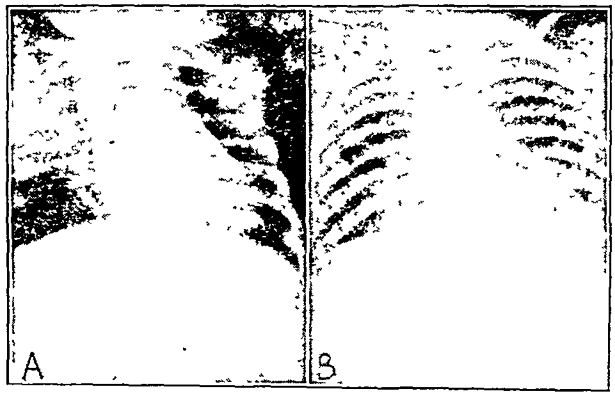

Fig. 2 (case 2).—*A*, miliary increase in markings scattered throughout both lungs; miliary tuberculosis. *B*, sixty days later, following thirty days of streptomycin therapy, the miliary markings are less than those on *previous film. The roentgenologist reports that "if this is true the lesion is probably not a miliary tuberculosis."*

All these children had roentgenograms indicative of tuberculosis, had strongly positive 1:5,000 intradermal tuberculin tests, and showed Myco. tuberculosis bacilli in their stomach

---

From the Department of Pediatrics, Presbyterian Hospital, Presbyterian Rush Division of the University of Illinois

The streptomycin for these *observations* was furnished by the Abbott Laboratories to Drs. H. L. Kretschmer and E. E. Irons and later by the Committee on Chemotherapy and *Other Agents of the National* Research Council to Dr. E. E. Irons

washings. All had fever of 101 to 105 F. and were tested for paratyphoid, typhoid and undulant fever; in all cases blood and stool cultures and nose and throat examinations were made to rule out any other sources of infection.

All the children were given 1,000,000 units of streptomycin a day, administered in divided doses at three hour intervals for thirty days. A total of 30,000,000 units of streptomycin was used for each child, except in case 3, in which treatment was for twenty days only with a total of 20,000,000 units.

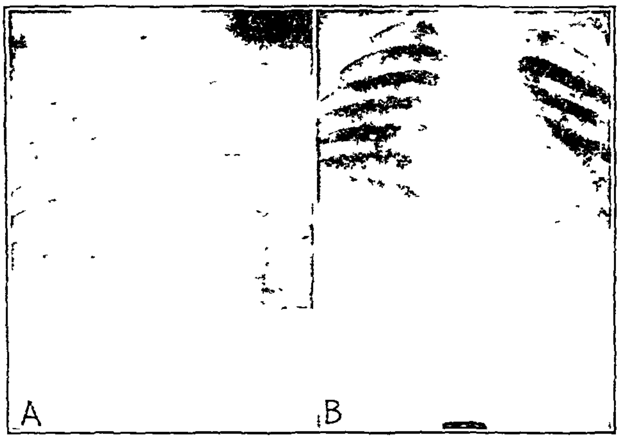

Fig. 3 (case 3).—*A*, some infiltration of both lungs not considered definite enough to diagnose as tuberculous. *B*, one month later, after twenty days of streptomycin therapy, there is complete clearing of the infiltration.

RESULTS

Figure 6 shows the temperature, weight and white blood cell count on each of the 4 children before, during and after treatment. Roentgenograms of each of the children are shown, one taken just before treatment was begun and one taken after treatment was completed. The histories prior to the initiation of treatment were as follows:

Case 1.—A Negro child, aged 2 years, weighed 26 pounds (11.8 Kg.). He had been followed at our dispensary for three months. The contact was in the home. He was a small, emaciated child with a spleen which was just palpable and with moderately enlarged tonsils. Examination of the blood showed 9.5 Gm. of hemoglobin, 3.1 million red blood cells, 15,600 white blood cells, 62 per cent neutrophils, 31 per cent lymphocytes and 7 per cent monocytes. His temperature at admission was 101 F. and rose to 102 F. before treatment was begun. When seen three months after treatment, he weighed 30 pounds (13.6 Kg.), was fever-free, and examination of his blood showed 11 Gm. hemoglobin, 4.2 million red blood cells and 8,700 white blood cells.

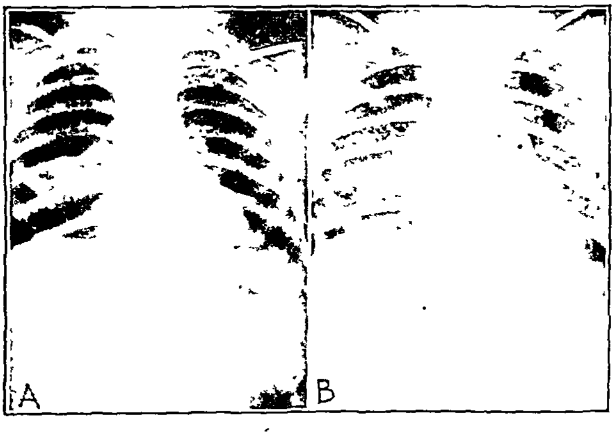

Fig. 4 (case 4).—*A*, infiltration of the right lung with markings suggestive of tuberculosis. *B*, three months later, there is an increase in the lung markings extending outward and downward from the right hilum; childhood type of tuberculosis.

Case 2.—A Negro child aged 7 months weighed 14 pounds (6,350 Gm.). He was in exceedingly poor condition with a cough, temperature of 101 to 103 F. and a palpable spleen. He had been followed in the dispensary one month before admission. His contact was in the home. His physical condition improved decidedly as a result of treatment, and at discharge he weighed 18 pounds (8,165 Gm.), a gain of 4 pounds (1,815 Gm.) in two months. Because of poor home conditions he was removed to the Cook County Hospital and has been fever-free and gaining in weight for the past three months. Examination of his blood at admittance showed 10 Gm. hemoglobin, 4 million red blood cells, 13,300 white blood cells, 48 per cent neutrophils, 35 per cent lymphocytes and 15 per cent monocytes; when he was discharged, it was 12 Gm. hemoglobin, 4.5 million red blood cells and 13,800 white blood cells

Case 3.—A white child aged 17 months weighed 23 pounds (10,433 Gm.). He had extremely good home surroundings and there was no history of contact with tuberculosis. Physical examination was noncontributory except for a temperature of 101 to 105 F., which had persisted for one month. He had been sent to us from another hospital with a diagnosis of tuberculosis, but as the roentgenograms were not entirely conclusive a thorough check was made, with agglutination tests and blood and stool cultures, all of which were negative. Myco. tuberculosis was found in considerable numbers in the first stomach washings. Examination of his blood showed 11.5 Gm. hemoglobin, 3.7 million red blood cells, 9,100 white blood cells, 42 per cent neutrophils, 49 per cent lymphocytes and 9 per cent monocytes. On discharge there were 13 Gm. hemoglobin, 4.5 million red blood cells and 9,000 white blood cells. He gained 1 pound (454 Gm.) during his treatment period and became fever-free. Since being home for three months he has remained fever-free, has gained weight and has eaten well.

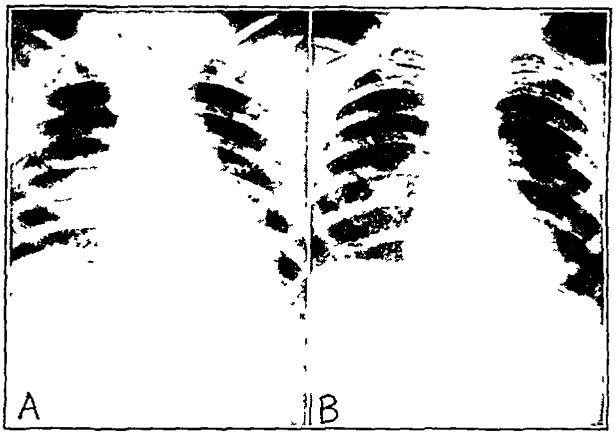

Fig. 5 (case 4).—*A*, picture now is definitely that of childhood type of tuberculosis. *B*, one month later, after thirty days of streptomycin, the increase in lung markings is less than on previous film.

Case 4.—A white boy aged 3 years weighed 37 pounds (16.8 Kg.). He was found to have a positive tuberculin test on routine examination. When the family was examined, the mother was found to have an open cavity, and she was removed to a hospital, where a collapse of the lung was performed. The child's roentgenograms showed an infiltrative type of lesion, but we were unable to obtain any organisms by stomach washings until three months later. By this time the lesions in the roentgenograms had progressed considerably, and his temperature varied from 100 to 101 F. persistently. Examination of his blood revealed 12 Gm. hemoglobin, 3.8 million red blood cells, 6,500 white blood cells, 64 per cent neutrophils, 32 per cent lymphocytes and 2 per cent monocytes. Examination on discharge showed 13 Gm. hemoglobin, 4.5 million red blood cells and 4,800 white blood cells. He was the only child that lost weight during the period of treatment; on discharge his weight was 36 pounds (16.3 Kg.). Since the conclusion of treatment he has gone to Colorado, has been fever-free and after two months weighs 38 pounds (17.2 Kg.).

COMMENT

In all these instances of pulmonary tuberculosis in children we have observed that after a month of treatment with streptomycin the temperature has fallen to normal, the general condition of the child has been bettered and the roentgenograms have shown improvement of the lungs. In none of these children have the roentgenograms shown any extension of the disease into uninvolved areas of lung during streptomycin therapy, in spite of the fact that lesions were extending prior to the institution of therapy. Instead, in all these children regression of the disease has been seen during the course of treatment and has continued after treatment has been stopped. In this regard the results are similar to those of Hinshaw in his report to the Committee on Chemotherapy.

It is well known that tuberculosis in children tends to recovery if the child is removed from its pernicious environment of exposure and if good living conditions are instituted. However, it could hardly be expected that such an improvement in the condition would occur in only a month of hospitalization. We can assume, therefore, that the results of our experience in these 4 instances of pulmonary tuberculosis in children agree with those of Hinshaw, who stated that "streptomycin is very likely to prove valuable as a palliative remedy in tuberculosis at least because of the apparent suppressive action." Many months of waiting for the healing to progress may thus be compressed into a much shorter period, and the danger of the occurrence of a generalized miliary form or a meningitis may be avoided.

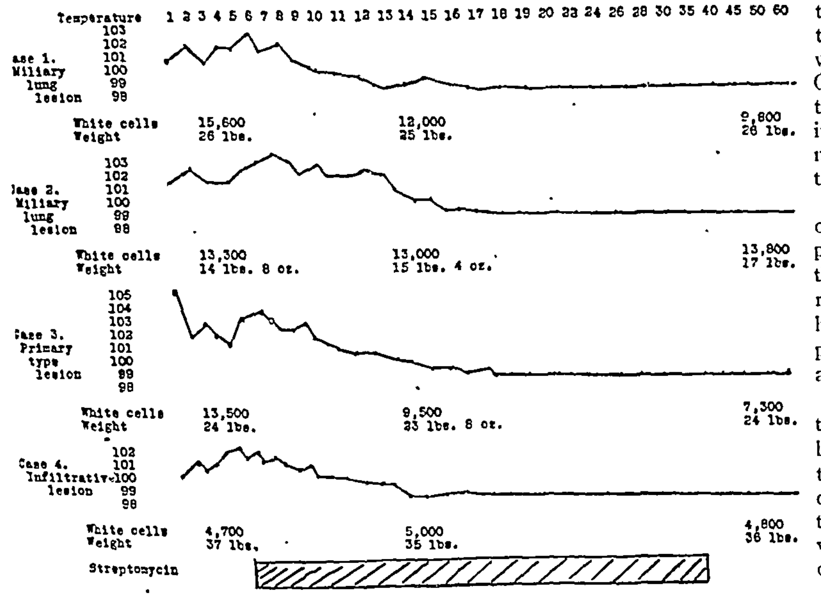

Fig. 6.—The temperature of all patients for five days before the initiation of streptomycin therapy, during the thirty day period of treatment and for thirty days after the conclusion of treatment. The total white blood cell count and the weight before, during and after treatment are also shown.

CONCLUSION

Treatment of 4 children 7 months to 3 years of age with pulmonary tuberculosis by the administration of 1,000,000 units of streptomycin a day for one month resulted in defervescence in all 4, improvement in their general condition and a regression of the appearance of the pulmonary lesions in the roentgenograms.

952 North Michigan Avenue—122 South Michigan Avenue.

Energy Required for Each Nerve Impulse.—In medullated mammalian nerve, the impulse travels at the rate of 100 meters per second, and the energy required per impulse per gram is less than 1/10 of a millionth of a small calory. The recording of such an event offers many difficulties, even with the use of specialized physical methods. Only in the last twenty years have really adequate instruments become available for the analysis of physical aspects of nervous function.

Council on Pharmacy and Chemistry

REPORT OF THE COUNCIL

The Council has authorized publication of the following statement.

AUSTIN SMITH, M.D., *Secretary.*

POSSIBLE DANGERS OF TETRATHIONATE THERAPY OF THROMBOANGIITIS OBLITERANS

About ten years ago Rabinowitz[1] and Rabinowitz and Kahn[2] introduced the use of thiosulfates in the treatment of thromboangiitis obliterans. Bancroft and his associates[3] have reported studies on the effect of sodium thiosulfate on the clotting index of the plasma and fibrinogen content of the blood. They concluded that the morbidity due to postoperative thrombophlebitis could be reduced by the prophylactic injection of sodium thiosulfate combined with a diet low in fats and proteins.

Theis and Freeland[4] proposed the use of sodium tetrathionate ($Na_2S_4O_6.H_2O$) in place of sodium thiosulfate ($Na_2S_2O_3.5H_2O$) in the treatment of thromboangiitis obliterans. Apparently the assumption was made that the toxicity of tetrathionate and that of thiosulfate were essentially the same. The usual intravenous doses employed were 1.0 Gm. of sodium thiosulfate and 0.885 Gm. of sodium tetrathionate and no side reactions or signs of toxicity were reported, although it must be admitted that no serious effort was made to detect subclinical toxicity in the patients treated.

Chen, Rose and Clowes[5] report the lethal dose of sodium tetrathionate in the dog as 1.0 Gm. per kilogram. Cacciavillani[6] found, however, that this substance is much more toxic in the rabbit. Recently Gilman and his associates[7] have reinvestigated the toxicity of tetrathionate, particularly with reference to its mechanism of action.

Gilman and his co-workers showed that tetrathionate can be reduced to thiosulfate in vivo, but the thiosulfate so formed is frequently retained and not excreted as is thiosulfate introduced directly into the body. They also showed that tetrathionate can oxidize mercaptans in vitro and presented evidence to show that such oxidation probably occurs in the body.

In the dog the intravenous LD_{50} for tetrathionate was determined to be about 250 mg. per kilogram and for the rabbit about 75 mg. per kilogram. All animals die from renal failure due to severe necrotizing lesions of the proximal convoluted tubules. With doses of 300 to 500 mg. per kilogram, signs of acute renal damage, as evidenced by complete anuria, may occur within thirty minutes after the intravenous administration of sodium tetrathionate.

Gilman and his associates present two possible theories to explain the severe nephrotoxic action of tetrathionate: (1) Tetrathionate selectively permeates the cells of the proximal tubule to exert a direct toxic action on catalytic systems dependent on the presence of — SH, or (2) the cells of the proximal tubules are selectively damaged by the removal of diffusible — SH compounds.

As an explanation of why toxic effects have not been reported in human beings treated with tetrathionate, Gilman points out that most commercially available tetrathionate contains large

amounts of thiosulfate and that the recommended doses are low. Nevertheless, the importance of maintaining the integrity of the —SH group in the body has been emphasized by recent studies on arsenic and mercury poisoning, and any drug which has potentialities for the destruction or interference with these groups must be considered as toxic and its use must be carefully limited. Moreover, the substantial evidence of nephrotoxic effects from the use of tetrathionate furnishes a convincing reason that the use of this agent in medicine should be abandoned.

Council on Industrial Health and the Council on Pharmacy and Chemistry

PYOGEN

(Pyogen Products, Inc.)

SPRAY PROMOTED TO INDUSTRY AS "COLD CURE"

A large number of inquiries concerning a product designated as Pyogen have been received by the offices of both the Council on Industrial Health and the Council on Pharmacy and Chemistry. The promotion of this preparation is believed to warrant a statement by the two Councils concerned.

The Council on Industrial Health and the Council on Pharmacy and Chemistry of the American Medical Association have therefore authorized publication of the following report.

Carl M. Peterson, M.D.
Secretary, Council on Industrial Health.
Austin Smith, M.D.
Secretary, Council on Pharmacy and Chemistry.

Reminiscent of the method used to promote a nostrum cold remedy[1] sold exclusively to business organizations is the current promotion of the product "Pyogen" (Pyogen Products, Inc., Detroit) labeled by the distributor as follows:

PYOGEN SOLUTION

For local or external use only

Suggested as an adjuvant (aid) in soothing minor irritations of the tissue of the nose, throat and mouth. Contains: Oxyquinoline sulfate, urea, thymol and menthol.

Use full strength and spray often with atomizer in a manner that assures full contact with the irritated areas. May be used as "mouthwash" or "gargle"—full strength. (In illness, avoid self diagnosis and treatment—consult your physician).

In striking contrast to this guarded label statement is the vicarious promotion of the product as a cold preventive and cure at the hands of its disciple, one E. B. Gallaher of the Clover Manufacturing Company, an industrial concern located at Norwalk, Conn. In a printed leaflet, designated as Letter No. 7 of this concern, dated July 1946, there is publicized Mr. Gallaher's testimonial for the use of Pyogen under the following caption:

ABSENTEEISM DUE TO COLDS AN ITEM WHICH ENTERS INTO THE COST OF PRODUCTION

Following an introduction it is explained that "This bulletin is on the subject of avoiding and checking the common cold from which so many serious ailments have their root." Mr. Gallaher then proceeds to relate the story of his personal experience with "Pyogen," stated as having been given to him by a doctor anonymously described as "an eminent scientist in the realm of bacteriology and preventive medicine" who has "established and operated for years a magnificent research laboratory in Detroit." Admittedly a sufferer from hay fever for the past thirty years, Mr. Gallaher explains that, after an examination by consulting physicians, the doctor advised him that he "was susceptible to colds and irritations of the respiratory tract, both in winter and summer," and that he should use this solution to spray his nose and throat thoroughly every night and morning, "allowing the liquid to run down the nostrils into the throat." Mr. Gallaher quotes the doctor's words as follows: "This spray will tend to influence a condition in the respiratory tract under which bacteria cannot 'eat'; and, therefore, cannot grow and multiply; it is compatible with and soothing to inflamed tissue." Mr. Gallaher states he was assured by the doctor "that because this spray was not of the usual 'antiseptic' type, which kills or injures germs on contact"; "it would not kill or injure cells of the body tissue." Using the spray, according to directions, Mr. Gallaher asserts that he has been free of colds and had no attack of hay fever during the season of 1945. With equally amazing candor, Mr. Gallaher expresses some doubt that the spray was responsible for relief from hay fever!

Mr. Gallaher goes on to explain that, with some urging on behalf of industry, the doctor agreed to arrange to have this spray made up to supply industrial plants. He points out that such concerns and wholesalers may now obtain it, but Pyogen is not to be found in drug stores and will not be supplied to individuals. Mr. Gallaher quotes quantity prices with and without an atomizer for bottles of either 2 ounces or 4 ounces respectively at $24 per carton of twelve, discounted at 20 per cent with 6 per cent off, f. o. b. Detroit. He indicates that Pyogen is furnished at cost to key personnel of his plant and is used in his shop to check colds as they appear. According to Mr. Gallaher, "Colds are apparently a thing of the past; and for the past year we have had no loss of time because of colds." He further explains that Pyogen Products, Inc., has been set up at 15050 Greenfield Road, Detroit, as a manufacturing and distributing agency that is distinct from the originating laboratory itself.

Mr. Gallaher concludes his message to industry as follows:

> I can vouch for excellent results for myself, for my family and for my employees, and I have received many letters of approval from industrialists to whom I have sent a sample for trial.
>
> I wanted to be certain of the results before recommending "Pyogen" to my friends, and now, after an experience of a year and a half with a large number of people, I am passing the information on to you for what it is worth, as I have no personal or financial interest, either directly or indirectly, in the product—my only interest is that, because of the remarkable job it has done for us, I feel I should pass on the information to other industrial plants and wholesalers so that they too may benefit from its use.
>
> If you wish a follow this matter further, write to the above company—"Pyogen" is well worth a tryout.

Numerous inquiries concerning Pyogen (many accompanied by the leaflet) that have been received by the American Medical Association attest the truth of Mr. Gallaher's words that his only interest is to pass on the information to other industrial plants and wholesalers. The majority of inquiries stem from physicians presumably acting or employed as consultants for industrial organizations that have been recipients of Mr. Gallaher's self-styled "bulletin." It is well worth noting that these concerns have felt the need of competent medical advice before complying with his recommendation that "'Pyogen' is well worth a tryout."

On request of the Council on Industrial Health, the distributor, Pyogen Products, Inc., supplied samples and the following quantitative statement of ingredients for Pyogen:

Glycerol	1: 1,000
Oxyquinoline sulfate	1:10,000
Carbonyldiamide	1%
Thymol	1:20,000
Menthol	1:20,000
(saccharin)	
(In distilled H_2O)	

In its letter revealing the composition of Pyogen, the firm offered to supply without charge up to 100,000 cc. of the solution for "carrying on objective, comparative clinical or other test work." Can it be that the distributor now feels that there is need of such evidence to support the distribution of Pyogen in industrial concerns?

It is evident from the formula that Pyogen is essentially a saccharin sweetened, weakly mentholated, distilled water solution containing ineffectual dilutions of well known anti-infective agents. Oxyquinoline sulfate (perhaps more widely known as Chinosol) is a disinfectant compound usually employed in effective dilutions of from 1 to 3,000 to 1 to 1,000. Carbonyldiamide is better known chemically as carbamide, or urea, as indicated on the label, and has been widely used in concentrations of 10 per cent or more as a proteolytic agent in chronic wound infections. Thymol, present in the same weak concentration as menthol, can hardly be expected to impart more than a faint odor of phenol. The menthol component is likewise too weak to provide appreciable local cooling or anesthetic action. It is doubtful that glycerol (better known as glycerin) in the strength provided can be considered as either a sweetening agent or a preservative. Even 50 per cent solutions of glycerin are hardly more antiseptic than water. All of this confirms the opinion attributed by Mr. Gallaher to the "doctor," that Pyogen is "not of the usual 'antiseptic' type, which kills or injures germs on contact. . . ." Indeed, it appears doubtful that such a solution is capable of any therapeutic action!

---

[1] Report of the Council on Pharmacy and Chemistry and the Council on Industrial Health: Formula A-N-1 (Benson Laboratories): Old Hokum in New Disguise, J. A. M. A. **131**: 1421 (Aug. 24) 1946.

The distributor's labeled suggestion for the use of Pyogen is worded in a manner that constitutes a forthright denial of Mr. Gallaher's testimonial that the product is a preventive for the common cold. If it is an aid in soothing minor irritations of the tissues as specified on the label, it shares this remarkable action with many other less expensive liquids, such as ordinary saline solution. Is it possible that the label is intended to provide immunity to the regulations of the Food and Drug Administration, while at the same time the distributor reaps the reward of Mr. Gallaher's promotional efforts on behalf of the product?

From a confidential source there comes to light the name of Dr. Alexander M. Rovin of Detroit, stated to be the owner and principal of Rovin Therapeutic Products, Inc., 15050 Greenfield Road, Detroit, a corporation chartered in 1934 that is engaged in the manufacture of bacterial vaccines, serum and a variety of therapeutic products. It is further revealed that Pyogen Products, Inc., although described by Mr. Gallaher as "a separate entity from the originating laboratory itself," has for its principal another individual named as the vice president of Rovin Therapeutic Products, Inc., located at the same street address! It thus appears that Dr. Rovin is the mysterious "eminent scientist" and that his concern, Rovin Therapeutic Products, Inc., is the "magnificent research laboratory" linked by Mr. Gallaher to the discovery of Pyogen. Apparently it is not intended that Dr. Rovin be nominally associated with the distribution of this amazing spray, despite the commercial connection between the so-called laboratory and the distributor: Can it be that scientific modesty impels Dr. Rovin to distribute Pyogen through another agency that is headed by his own vice president?

According to information in the files of the Council on Pharmacy and Chemistry and the Bureau of Investigation of the American Medical Association, the name of A. M. Rovin has long been connected with the operation of a "laboratory" in Detroit, under various names, engaged in the business of marketing worthless pharmaceuticals. A letter addressed to a physician in 1924 signed by A. M. Rovin on the stationery of C. Leventis, M.D., Humanized Serum, 1002 Stroh Bldg., Detroit, described an immune serum for tuberculosis that was the subject of subsequent critical comment.[2] There is also a record that this same Rovin was at one time associated with Sherman Laboratories, Inc., 140506 East Jefferson Ave., Detroit, distributors of a line of vaccines. The Detroit telephone book for 1926 listed Rovin, A. M., Biological Depot, at 3524 Cass, and in 1928 a product called Proteostreptosol was advertised by the Rovin Laboratory of 3522-3524 Cass Avenue, Detroit, producers of ampul solutions for injection. In 1931 Alexander M. Rovin was listed as president of A. M. Rovin Laboratories, Inc., at 20 East Bethune Street, Detroit, then engaged in the manufacture of ampul preparations and biochemical products. A group of that concern's "uniglandular" products were subsequently declared not acceptable for New and Nonofficial Remedies by the Council on Pharmacy and Chemistry.[3] The same concern was also the subject of a notice of judgment issued in 1937 by the Food and Drug Administration for adulteration and misbranding of ampuls of iron cacodylate and of iron cacodylate and phosphorus fraudulently represented as a cure for malnutrition, anemia and neurasthemia. This concern was at one time also connected with the sale of "radium active water" advertised to physicians as a solution of "equilibrated elemental radium"! This somewhat odious history may be said to establish a sort of dubious virtuosity for Dr. Rovin.

These hide and seek tactics typify the methods used to sustain the promotion of quack remedies. Through the years it is evident that Dr. Rovin has continued his activities by manipulation of the name for his various business ventures. Pyogen Products, Inc., appears to be his latest outlet, despite the fact that he has evidently taken pains to keep his name out of that organization and the product Pyogen is vicariously promoted by a layman. Evidently the burden of proof for the statement that Pyogen renders bacteria incapable of eating ultimately rests with Dr. Rovin.

The sale of Pyogen should be condemned for any therapeutic purpose. The lay promotional efforts of Mr. Gallaher, however sincere, are considered to be the tool of quackery in its cleverest form, and his self denial of personal commercial interest is clouded by quotation of prices for the Detroit distributor. The Councils again emphasize that "testimonials" either from laymen or from physicians do not constitute scientific evidence. In the distribution of Pyogen exclusively to industrial concerns, it is evidently the hope of the commercial backers that the personal testimony of Mr. Gallaher will prevail on the medically uninformed, despite the lack of published scientific evidence to support the use of the product.

Published medical literature is replete with evidence to indicate that disinfectant solutions used for the purpose of prevention or treatment of upper respiratory infection are notoriously ineffectual. Reimann[4] has just recently pointed out that a wide variety of antiseptic sprays are used for this purpose in spite of the fact that "none can be effectively bactericidal or virucidal on mucosal surfaces without destroying the membrane as well" and "even if they were effective, they are washed away in a few seconds or minutes after their application by ciliary activity, the flow of exudate and gravity." Aptly enough, he points out that although such procedures do at times afford a temporary sense of comfort, there is no evidence that the course of the disease is otherwise influenced.

The Councils believe that competent medical advice always should be sought by concerns that are urged to use some new "cure" or health "aid." Information on such subjects is always available from the American Medical Association to those who wish to provide rational safeguards for the health of employees and other individuals.

NEW AND NONOFFICIAL REMEDIES

The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies. A copy of the rules on which the Council bases its action will be sent on application.

Austin Smith, M.D., *Secretary.*

POSTERIOR PITUITARY INJECTION (See New and Nonofficial Remedies, 1946, p. 467).

The following dosage form has been accepted:

The Harrower Laboratory, Inc., Glendale, Calif.

Solution Posterior Pituitary: 1 cc. ampuls and 10 cc. vials. Chlorobutanol, 0.5 per cent as a preservative.

NICOTINAMIDE (See New and Nonofficial Remedies, 1946, p. 627).

The following dosage forms have been accepted:

The Harrower Laboratory, Inc., Glendale, Calif.

Tablets Niacinamide: 50 mg.

E. S. Miller Laboratories, Inc., Los Angeles

Solution Niacinamide, 50 mg. per cc.: 15 cc. vials. Preserved with 0.5 per cent chlorobutanol.

The Vale Chemical Co., Inc., Allentown, Pa.

Tablets Nicotinamide: 50 mg.

THE HEALTH CHALLENGE OF OUR SCHOOLS

Manifest unrest prevails in the field of education in the United States. Teachers' strikes and threatened strikes, pupils' strikes, surveys of school systems and widespread public discussion indicate that there are real problems to be solved in American education. Educational facilities surely need improvement. However, the most immediate problem is insufficient money for payment of teachers.

An increasing shortage of teachers threatens because of abandonment of the teaching profession in favor of better paid occupations. Moreover, new recruits to the profession are few because of the poor inducements offered in existing positions. The shortage of teachers has resulted and will continue to result in increased burdens for the teacher, deteriorating quality of available teachers and steady deterioration in the quality of education received by the students.

In many places local funds are insufficient to provide adequate educational standards. Several bills have been introduced into the Congress to procure federal money for improving local educational programs and particularly to meet the serious problem of teachers' salaries.

In sixteen states the majority of classroom units have to be maintained on less than $1,600 a year. Yet in all but two of these states the percentage of state income allocated to education purposes is greater than the national median. Obviously federal assistance is necessary in at least fourteen states if educational opportunity is to be equalized.

The American Medical Association has a long standing and deep interest in the schools because of its interest in health and health education. Adequate health education is impossible unless the general standards of education are maintained. In the schools today a newly awakened and active interest in health education is manifest. The Office of Education, the Public Health Service and the Children's Bureau are concerned in health education. The professional associations of educators and of physicians also have a profound interest in the health of the nation's children.

The national health program of the American Medical Association proposes that if federal money is made available for local use it should be in response to demonstrated need. Only in this way can the poorer and less populated districts be adequately helped. The Association has stood, moreover, for the greatest possible measure of local financing and control. Federal control should be limited to the necessary auditing of federal funds, if any. School health service is already administratively placed in some states in the health department and in others in the education department. Some of the proposed legislation would complicate the picture unnecessarily by making federal appropriations, if any, for school health service to a third agency, such as the Children's Bureau. Such a third agency would then have to redistribute funds to states through health or education departments.

Since 1911 the American Medical Association and the National Education Association have had a Joint Committee on Health Problems in Education. In common with educators the medical profession holds that the schools are for educational purposes and are not intended to be made into hospitals or clinics. THE JOURNAL endorses the principle expressed by the American Association of School Administrators in its year book "Health in Schools":

> . . . In the field of medical service responsibility must be assumed jointly by the individual, school, home, family physician, and dentist and community. . . : The responsibility for medical and dental service must not be usurped by the school because of the immediacy of current health problems. The schools in general have avoided undertaking medical treatment. The medical service has been limited to health examinations, consultations, and advice. The recommendations within the school are concerned with the child's program, involving shortening of the school day, adding rest, extra feedings and indication for special classes.
>
> Good administration will allow the educational specialist and the health specialist to work together, each respecting the professional status, skill and activities of the other.[1]

GLYCOL VAPORS FOR DISINFECTING PURPOSES

The desirability of developing a method of disinfecting air in closed and heavily contaminated spaces is unquestionable. Many procedures have been under investigation. During recent years numerous studies on the germicidal properties of vapors and mists have been published. Various substances have been employed, but through the work of O. H. Robertson and his associates and others special attention has been given to the glycols, notably propylene glycol and triethylene glycol.

Up to 1943 serious practical difficulties inhibited adequate study of glycol vapors. Robertson,[1] for example, said at that time "Practical application of the use of glycol vapors for the purpose of controlling air borne infection has had to await the construction of suitable apparatus for the dispersion of glycol vapors into large and enclosed spaces and the development of an instrument to control automatically the concentration of glycol vapor in the air. Rapid progress is being made in the solution of both these problems."

---

[1] American Association of School Administrators: Health in Schools. National Education Association, Washington, D. C., 1942, pp. 58 and 308.

[1] Report of the Standard Methods Committee for the Examination of Germicides and Antibacterial Agents, 1943, Am. J. Pub. Health 34:886 (Aug.) 1944.

An extensive study of glycol vapors for the control of bacteria in large spaces was reported by Bigg and his colleagues [2] in 1944. Their studies were carried out in a specially constructed air conditioned room. The glycol determinations were made on 2 liter samples of room air when propylene glycol was analyzed and on 1 cubic foot samples of air when triethylene glycol was used. Several methods for the production of glycol vapor were employed in their studies. An air scrubber was constructed in which room air was blown through a spray of liquid glycol and droplets were eliminated by a series of baffles and filters which permitted only the vaporized glycol to escape with the carrier air. This proved to be a satisfactory apparatus for vaporization.

These workers found that the concentration of propylene glycol and triethylene glycol vapor necessary to produce bactericidal action is 0.1 mg. per liter and 0.005 mg. per liter respectively. This concentration appears to be free from health or explosive hazard. Another important study of the possible value of glycols in the control of air borne bacteria was carried out by the Navy Medical Research Unit No. 1 [3] and reported in 1944. The technic of dispersion varied somewhat from that employed by Bigg and his colleagues. The navy studies indicated that under the conditions of study glycols are bacteriologically ineffective in controlling droplet dust contamination of air, though this does not mean that their action on droplet nuclei or on the incidence of infections is absent.

In 1946 Robertson,[4] serving as referee for the Committee of the American Public Health Association on standard methods for the examination of germicides and antibacterial agents, reviewed the evidence concerning glycol vapors as germicides. It has been found, he said, that relative saturation of air with a glycol vapor is of greater significance as far as germicidal activity is concerned than is the actual content in milligrams of glycol per liter of air. Consequently an important unsolved problem is the development of testing of apparatus for the dispersion of glycol vapors and the control of their concentration in the air. The principles of such apparatus have been fairly satisfactorily worked out, but, at the time of writing, Robertson said that the actual production of dependable instruments had not yet been achieved. There is also available a device for the automatic regulation of glycol vapor in the air called the glycostat. This instrument has been calibrated so that it can measure degrees of saturation of the air with glycol vapor by direct reading of the variations in the intensity of light reflected from the glycol condensing surface of the wheel of the instrument.

Glycol vapors for the disinfection of closed spaces, such as schoolrooms, barracks or theaters, are not yet ready for general use. Adequate proof of the germicidal effects of both propylene and triethylene glycol appears to be established. The choice of agent, certain details of vaporization and other technical aspects have not yet been worked out to the extent that would warrant the large scale use of glycol air disinfection. Commercial promotion [5] of apparatus for glycol vaporization in public buildings is, therefore, premature.

BASIC SCIENCE INSTRUCTION IN HOSPITAL RESIDENCIES

Apparently misunderstanding has developed regarding the nature of instruction in basic science that ought to be part of the training of a hospital resident who wishes to qualify for practice of one of the specialties in medicine. Such a physician should, of course, know the application of the basic medical sciences employed in the specialty of his interest.

Apparently many hospitals and their staffs have concluded that such training is possible only if the hospital is affiliated with a medical school; the school is requested to present organized course work and supervised laboratory exercises for the residents of the hospital. Elsewhere in this issue is a statement by the Council on Medical Education and Hospitals of the American Medical Association defining its concept of applied basic science instruction in hospital residencies. Applied basic science instruction does not necessitate formal courses but should be distinctly of an applied nature, integrated with the daily clinical work.

In the instruction of residents in anatomy the attitude and enthusiasm of the hospital attending and resident staff in employing the opportunities to teach and learn gross and microscopic anatomy from clinical and pathologic material are more important than an available dissecting laboratory. The facilities and professional personnel of the hospital should afford opportunity and incentive to broaden the resident's existing knowledge of bacteriology. Similarly the biochemistry laboratory of the hospital should provide the stimulus for the resident to enhance knowledge of that subject acquired in medical school and to relate such knowledge to the clinical problems he encounters. The clinical-pathologic conference can be a most effective device for correlating the basic sciences with clinical medicine. The wards of a residency hospital provide ample opportunities for the application and expansion of the house officer's understanding of pharmacology. Clinical medicine, with its diagnostic equipment and special apparatus, affords a rich field for the study of physiology and an effective stimulus for the application of the basic principles of this science.

Certainly the overburdened medical schools have contributed heroically to supplementing hospital training with more formalized instruction and research opportunities. Certain of the organized courses of medical schools, primarily for the residents in their own hospitals, are decidedly superior, representing the best thought of the faculty. Yet hospitals and specialists that train residents are shirking their responsibility if they seek to induce medical schools to assume most of the burden for instruction in basic sciences. This not only is an impossible burden for the medical schools but also is counter to every modern trend in medical education, in which there is increasingly closer correlation of the basic sciences and clinical experience.

The problem of basic medical science instruction was the topic for discussion at the February meetings of the Advisory Board for Medical Specialties. It was considered further in a joint meeting of that board with the Council on Medical Education and Hospitals of the American Medical Association and the executive council of the Association of American Medical Colleges. All three groups agreed in principle with the statement published in this issue of The Journal, which can serve as a guide in the organization of residency programs in accordance with the regulations for approval by the Council on Medical Education and Hospitals.

Current Comment

"BRITISH MEDICAL JOURNAL" PUBLICATION

The *British Medical Journal* for February 22 comes as a single page mimeographed on both sides. The first item reads:

> *By Candle-Light.* This, the smallest B. M. J. since 1840, has been "printed" on hand-operated duplicators in B. M. A. House, by permission of the Ministry of Fuel and Power and the C. O. I. Our "printer" this week is the Secretary of the B. M. A.
>
> News and Views in this issue are evaporated to dryness. Abbreviations will, we hope, be unambiguous.
>
> Distribution of doctors in Britain is done largely through Journal advertisements. Hospital and municipal vacancies are noted overleaf. Candidates should apply to the authorities for details. Changes of 2,000 addresses are held up, and addresses of numerous new members cannot be recorded.

In a letter from the editor he informs us that there will probably be three issues of the *British Medical Journal* in this form. The printing is being done on three or four machines in their own building and hand operated, owing to the cutting off of electricity. Condensed as the publication may be, it contains nevertheless a reference to the centennial of the American Medical Association and the publication of the History of the American Medical Association in The Journal. We extend to our British colleagues in this difficult period our sincere sympathy in their affliction.

TUBERCULOSIS STATISTICS IN THE UNITED STATES

Since the turn of the century the death rate from tuberculosis in the United States has been reduced, according to the Metropolitan Life Insurance Company's Statistical Bulletin of November 1946,[1] from approximately 200 per hundred thousand to about 40. In the white population the disease is now a relatively minor cause of death, with a rate of 30 per hundred thousand. In 1944 forty-three states had tuberculosis death rates under 50 per hundred thousand, whereas in 1934 there were only twenty states in that category. In five states the death rate from the disease in 1944 had dropped to well below 20 per hundred thousand. The campaign against tuberculosis has been intensified greatly through the availability of increased funds and through the impetus given by the organization of the Tuberculosis Division of the U. S. Public Health Service. The Bulletin quoted expresses the opinion that tuberculosis may cease to exist in our time. Among the favorable factors may be mentioned the fact that the chances of becoming infected are now greatly diminished and that people generally live and work under more healthful conditions, are better fed and have more adequate knowledge of personal hygiene. The facilities for detecting existing cases have made great advances, so that a greater proportion of unsuspected infections are being discovered in the early stages, when the chances of cure are best. The use of mass x-ray examinations in the army, in schools, in colleges, in factories and in entire communities has undoubtedly contributed much to early recognition of the disease. However, encouraging as the signs are, tuberculosis even now takes more than 50,000 lives a year and is a serious cause of disability among persons in the productive period of life. Tuberculosis still ranks high among the causes of death at most age periods. Among white women from 20 to 34 years of age it remains the principal cause of death, accounting for about one fifth of all deaths in this broad age range. Among white men the disease ranks second only to accidents in the prime ages from 20 to 39 years. In these two decades of life among Negro men, according to the Bulletin, tuberculosis outranked every other cause without exception, as it did among Negro women of the age range from 10 to 39 years. The conquest of tuberculosis, if at all possible, involves not only full utilization of the existing knowledge and facilities for discovering and treating the disease but also the creation of healthful environmental conditions of work and recreation. The attack may well be concentrated in those areas and among those persons in our population where infection is most prevalent and death rates highest.

ORGANIZATION SECTION

Washington Letter

(From a Special Correspondent)

March 6, 1947.

Critical Shortage of Physicians

In a speech delivered for him by Deputy Surgeon General James A. Crabtree, Dr. Thomas Parran, Surgeon General, U. S. Public Health Service, told American Legion medical advisers that "little or nothing has been done to relieve the critical shortage of doctors, scientists, nurses and engineers, urgently needed in both preventive and curative medicine." Dr. Parran said that the nation "has a serious price to pay" for failing to maintain training of young scientists in wartime. He said that it should be made possible for those who have potentialities in the medical profession to develop their skills and put them to productive use. In the same vein, Army Surgeon General Kirk said that "We must get doctors into the Army and train them or there won't be any medical service."

Drive for Economy Brings Personnel Ceiling in Veterans Agency

One result of the Republican drive for economy in government was an order by Gen. Omar N. Bradley, Veterans Administration, applying a personnel freeze on his agency. No additional persons can be employed except for a few doctors, stenographers and typists. A long list of additional economies includes a proposal to audit medical fees closely. General Bradley told agency chiefs that the Veterans Administration would be required by Congress to get along on less money and that the agency might as well start to economize.

Physicians Accused of Neglecting Exercise for Bedridden Patients

Dr. Augustus Thorndike of Harvard University, wartime director, Reconditioning Consultant Division, Army Surgeon General's office, stated here that civilian medical practitioners have failed to adopt a medical lesson of the war that some form of exercise is necessary for bedridden patients recovering from operations. Dr. Thorndike said "the civilian doctor discharges his patient as early as possible to convalesce at home, making room for another patient in the overcrowded hospital system. He is then forgotten until he reports back to the doctor's office, weeks later." Dr. Thorndike lectured at a postgraduate course for physicians at George Washington University Medical School.

Great Medical Center Predicted

The nation's capital now has "more dilapidated hospital plants than any city of comparable size in the country," but Washington will one day be a great medical center, according to Dr. Thomas Parran, U S. Public Health Service. Projects now under way which will raise hospital standards in the District of Columbia, he said, include the hospital merger under the Tydings Act, the proposed Veterans Administration hospital in Arlington, Va., and expansion of the National Institute of Health. Addressing a George Washington University Equipment Fund meeting, he said the need for hospitals in the United States is urgent. There was a 61 per cent increase in the number of patients admitted between 1940 and 1945. Conditions have deteriorated because of an increase in population, a shortage of physicians and nurses and overcrowded housing.

Medical Chief Criticizes Legion for Opposition to Medical Reforms

Dr. Paul R. Hawley, medical director, Veterans Administration, criticized reported opposition of the American Legion to certain medical reforms in the agency, declaring that the Legion was opposed to public law 293, which removed many agency medical positions from civil service. He advocated that this law be extended. He said civil service restrictions hinder efforts to get a sufficient number of physicians to staff the agency's facilities. He promised that the best possible medical service would be available to all veterans as long as he headed the Veterans Administration medical service. He was followed at the meeting of American Legion medical advisers by Brig. Gen. Wallace H. Graham, physician to President Truman, who urged physicians to get the support of organizations like the Legion in attempting to meet the medical needs of the people.

Surgeon General Lauds Navy Hospital Corpsmen

Rear Admiral Clifford A. Swanson, Navy Surgeon General, told American Legion medical advisers that navy hospital corpsmen "did more for our wounded than the wonder drugs." He said that as a result of the heroism and skill of the corpsmen only 3 per cent of the wounded sailors and marines died. He reported that 889 corpsmen were killed and 1,700 were wounded in Pacific battles.

Needs of Civilian Amputees

Major Gen. C. B. Erskine, U. S. M. C., chief of the Reemployment and Retraining Administration, points out that there were 17,000 military amputees as a result of the war but that more than 125,000 civilians underwent amputations during the same period. He said that miracles had been accomplished in rehabilitation of the handicapped.

Coming Medical Meetings

Alabama, Medical Association of the State of, Birmingham, April 15-17. Dr. Douglas L. Cannon, 519 Dexter Ave., Montgomery 4, Secretary.

American Association for the Study of Goiter, Atlanta, Ga., April 3-5. Dr. Thomas C. Davison, 478 Peachtree St., N. E., Atlanta 3, Secretary.

American Association of Anatomists, Montreal, Canada, April 3-5. Dr. Normand L. Hoerr, 2109 Adelbert Road, Cleveland 6, Secretary.

American Association of Industrial Physicians and Surgeons, Buffalo, N. Y., Statler Hotel, April 26-May 4. Dr. Frederick W. Slobe, 28 E. Jackson Blvd., Chicago 4, Secretary.

American College of Physicians, Chicago, April 28-May 2. Mr. E. R. Loveland, 4200 Pine St., Philadelphia 4, Secretary.

American Laryngological, Rhinological and Otological Society, St. Louis, April 25-26. Dr. C. Stewart Nash, 288 Alexander St., Rochester 7, N. Y., Secretary.

American Otological Society, St. Louis, April 21-22. Dr. Gordon D. Hoople, 713 E. Genesee St., Syracuse 2, N. Y., Secretary.

American Society for Research in Psychosomatic Problems, Atlantic City, May 3-4. Dr. Edwin G. Zabriskie, 714 Madison Ave., New York 21, Secretary.

Arkansas Medical Society, Little Rock, April 17-19. Dr. William R. Brooksher, 602 Garrison Ave., Fort Smith, Secretary.

California Medical Association, Los Angeles, Hotel Biltmore, April 30-May 3. Dr. L. Henry Garland, 450 Sutter St., San Francisco 8, Secretary.

Connecticut State Medical Society, New Haven, April 28-30. Dr. Creighton Barker, 258 Church St., New Haven 10, Secretary.

Dallas Southern Clinical Society, Dallas, Texas, March 17-20. Dr. Glenn D. Carlson, 1133 Medical Arts Bldg., Dallas, Secretary.

Florida Medical Association, Miami, April 20-23. Dr. Robert B. McIver, P. O. Box 1018, Jacksonville, Secretary.

Georgia, Medical Association of, Augusta, Bon Air Hotel, April 22-25. Dr. Edgar D. Shanks, 478 Peachtree St. N. E., Atlanta, Secretary.

Hawaii Territorial Medical Association, Lihue, Kauai, May 1-4. Dr. Harry L. Arnold Jr., 510 S. Beretania St., Honolulu 53, Secretary.

Nebraska State Medical Association, Omaha, April 28-May 1. Dr. R. B. Adams, 416 Federal Securities Bldg., Lincoln 8, Secretary.

Iowa State Medical Society, Des Moines, April 16-18. Dr. John C. Parsons, 406 Sixth Ave., Des Moines 9, Secretary.

Maryland, Medical and Chirurgical Faculty of, Baltimore, April 22-23. Dr. W. Houston Toulson, 1211 Cathedral St., Baltimore 29, Secretary.

Michigan Postgraduate Clinical Conference, Detroit, Book-Cadillac Hotel, March 12-14. Dr. L. Fernald Foster, 2020 Olds Tower, Lansing 8, Secretary.

Mid-Atlantic Section, American Urological Association, Washington, D. C., Hotel Statler, March 20-22. Dr. Theodore R. Fetter, 255 S. 17th St., Philadelphia, Secretary.

Missouri State Medical Association, Kansas City, March 30-April 2. Mr. Thomas R. O'Brien, 634 N. Grand Blvd., St. Louis 3, Executive Secretary.

New Jersey, Medical Society of, Atlantic City, Haddon Hall, April 22-24. Dr. Alfred Stahl, 160 Lincoln Ave., Newark 4, Secretary.

New Mexico Medical Society, Albuquerque, April 30-May 3. Dr. H. L. January, 221 West Central Ave., [illegible]

North Carolina, Medical Society of th [illegible] Robert E. Lee Hotel, April 28-30. Dr. Ro [illegible] Box 232, Red Springs, Secretary.

Northern Tri-State Medical Association, Detroit, April 8. Dr. John L. Stifel, 232 Michigan St., Toledo 2, Ohio, Secretary.

Oklahoma State Medical Association, Tulsa, Mayo Hotel, April 22-25. Mr. R. H. Graham, 210 Plaza Court Bldg., Oklahoma City, Executive Secretary.

Southeastern Surgical Congress, Louisville, Ky., Brown Hotel, March 10-12. Dr. Benjamin T. Beasley, 45 Edgewood Ave. S.E., Atlanta 3, Ga., Secretary.

Southwest Allergy Forum, Shreveport, La., March 31-April 1. Dr. Sim Hulsey, 505 Medical Arts Bldg., Fort Worth, Texas, Secretary.

Tennessee State Medical Association, Memphis, April 8-10. Dr. W. M. Hardy, 706 Church St., Nashville 3, Secretary.

Medical Legislation

MEDICAL BILLS IN CONGRESS

Medical Aid Act of 1947

A bill introduced by Senator Lodge, Massachusetts, S. 678, proposes to enact a **"Medical Aid Act of 1947,"** under which assistance would be given to the states in furnishing certain medical aid to needy and other individuals. The term "medical aid" is defined to mean "making available, free to needy persons and at a minimum cost to other persons, x-ray services, respirators and any drug which is of substantial, accepted, and specific value in the treatment or prevention of pneumonia, streptococcus infections, diabetes, pernicious anemia and other anemias, congestive heart failure, glandular and nervous disorders, nutritional deficiency, typhoid fever, and various infectious diseases." The bill proposes that there shall be authorized for the fiscal year ending June 30, 1948 and for each fiscal year thereafter, such sums as may be necessary to carry out its provisions.

Training of Nurses

Representative Lane, Massachusetts, has introduced H. R. 2077 proposing to continue in effect until June 30, 1950 the provisions of the Act of June 15, 1941 relating to **the training of nurses** through grants to institutions providing such training.

Miscellaneous

A bill introduced by Representative Walter, Pennsylvania, as H. R. 1680, proposes to provide a **correctional system for youth offenders** convicted in the courts of the United States. This legislation, if enacted, would be cited as the "Youth Authority Act."

Representative Angell, Oregon, proposes by H. R. 1869 to provide for **compensation to blind persons** for loss of earning power due to blindness. Each blind person whose income, other than compensation payable under this legislation, is $300 a year or less will be paid $75 a month. If the income exceeds $300 a year, he will be paid $75 a month less one-half the average monthly amount by which his other monthly income exceeds $300 a year.

STATE LEGISLATION

Arizona

Bills Introduced.—H. 205 proposes the enactment of a state **hospital survey and construction act** requiring a survey of existing hospital and public health center facilities within the state and the preparation of a program for the construction of additional needed facilities. The proposal also requires the appointment of an advisory survey and construction council and appoints the superintendent of public health as the agent or agency to apply for and accept federal funds to assist in the state survey and construction program. H. 206 proposes a law providing for the licensing, regulation and inspection of **hospitals within the state.**

California

Bills Introduced.—A. 2005, to amend the **law relating to chiropractic,** proposes among other things to define chiropractic as follows: "(b) Chiropractic is the science and art of determining, locating and correcting by adjustment, impingements upon nerves either within the spine or at the point of emergence therefrom through spinal foraminae, caused by subluxation of the vertebrae. (c) A spinal subluxation is an irregularity in location of vertebrae within the natural range of movement, less than traumatic, which causes an impingement either upon the spinal cord or upon a nerve at the point of emergence thereof through spinal foraminae which causes impingement upon nerve tissue. (d) An impingement is an excessive pressure upon nerve tissue of the spinal cord or of a nerve at the point of emergence thereof through spinal foraminae, which prevents the normal transmission of nerve force." A. 2026 proposes a law to prohibit the use of live **dogs and cats in surgical operations** except under certain circumstances and to prohibit the allocation to medical or scientific institutions of dogs or cats. The proposal would limit experiments to persons having experimenters' licenses which have been issued by a commission to be appointed by the governor. The commission members must be members of a society formed for the purpose of preventing cruelty to animals. No exception is made in the case of properly conducted scientific experiments or investigations performed under the authority of the faculty of a regularly incorporated medical college or university. A. 2078, to amend the business and professions code, proposes to prohibit any one not licensed under that code from using **physical medicine** in treating the human body of any person for compensation. A. 2290, to amend **the insurance code,** proposes the organization of medical and hospital service associations. S. 1026, to amend the education code, proposes to prohibit any instruction in **sex relations, marital problems,** or like questions at any time prior to the twelfth grade. The proposal would further require that when such instruction is given it shall be conducted by a duly licensed physician and handled as an individual activity retaining the normal relationship of physician and patient. S. 1050 proposes to prohibit any person not licensed as a physician and surgeon or as a drugless practitioner from **using any drugs or severing or penetrating** any tissues of the human body. S. 1062, to amend the business and professions code, proposes to grant to special agents and investigators of the board of medical examiners the **right to inspect files** and correspondence in the possession of any licensed physician. S. 1068 proposes to prohibit any person other than a physician and surgeon from making a **postmortem examination** or performing an autopsy. S. 1257, to amend the health and safety code, proposes to authorize the state department of public health to assist in the development of **community blood banks** for the collection, processing and distribution of human whole blood, blood plasma and blood fraction products derived from human blood.

Connecticut

Bills Introduced.—H. 868 proposes a law to prevent rebates in connection with the **purchase of eyeglasses.** H. 945 proposes to **authorize chiropractors** to execute death certificates. H. 946 and H. 948 propose to **authorize a chiropractor** to prescribe hygienic and sanitary measures incident to the care of the body. H. 949 proposes to **authorize naturopathic physicians** to execute death certificates. H. 953 proposes to authorize licensed physicians to prescribe means or methods for the **temporary prevention of pregnancy** in a married woman when, in the opinion of such physician, pregnancy would endanger the life or the health of such woman. H. 1235 proposes to require applicants for a **license to practice naturopathy** to have had at least one year college credit prior to entering a naturopathic school. S. 285 proposes an act for the regulation of **massage practitioners** and defines the practice of massage as "any process or action of conjoint motion and pressure applied by hand, such as rubbing, stroking, kneading, tapping or other similar manipulation, with or without the application of creams, lotions or liniments or the use of hand vibrators or rollers to any part of the human body for the purpose of relieving pains, aches, stiffness or soreness of muscles or for the purpose of stimulating blood circulation or reducing conditions of obesity, including the use of vapor treatments and any and all other manual means, such as physical exercises for the conditioning of the human body."

Delaware

Bills Introduced.—H. 42 proposes to require all persons desiring to obtain a marriage license to obtain a certificate from a duly licensed physician showing that the applicant has undergone a standard serologic **test for syphilis** and that the applicant is not infected or if so infected is not in a stage of the disease which is or may become communicable to the marital partner. This proposal was amended in the house February 18 so as to define the term "physician" as meaning any duly licensed medical osteopathic or chiropractic practitioner. H. 191 proposes a law for the licensing, inspection and regulation of hospitals and the creation of an **advisory hospital council.** H. 192 proposes the enactment of a **hospital survey and construction act** requiring an inventory of existing hospitals and the development of a program for the construction of additional needed facilities. The proposal would appoint the state board of health as the agency authorized to apply for and accept federal funds for state assistance in survey and construction programs. H. 210, to amend the **workmen's compensation law,** proposes that the terms "physician" or "surgeon" should include osteopaths.

Idaho

Bills Introduced.—H. 112 proposes to authorize the state board of education to conduct **examinations in the basic sciences** for all persons who desire to apply for a license to practice the healing art or any branch thereof in the state. S. 102 proposes the enactment of a **state hospital survey and construction act** requiring a statewide survey of hospital facilities and the preparation of a program for the construction of additional needed facilities. The proposal would also require the appointment of an advisory hospital council and would authorize the commissioner of the state department of public health to apply for and accept federal funds to assist the state in survey and construction activities.

Bills Passed.—H. 141 passed the house February 11. It proposes to **add cancer** to the list of diseases which a physician must immediately report to the department of public health. H. 144 passed the house February 18. It proposes to limit the **sale of barbituric acid** or compounds to sale on a prescription signed by a person licensed to prescribe or administer barbiturates.

Indiana

Bills Introduced.—H. 450 proposes to provide for the licensing, inspection and regulation of **nursing homes.** S. 282 proposes to authorize the state board of health to compile in pamphlet form recognized scientific information in regard to **contraceptive measures** and to release said pamphlets to state universities, colleges and normal schools for instructional purposes, to married women whose financial status does not permit them to rear and educate more children and to licensed physicians, who may redistribute such pamphlets to patients whom they may deem in need thereof.

Bill Passed.—S. 212 passed the senate February 14. It proposes to amend the medical practice act by authorizing the board of medical examiners to **accept examinations certified by the National Board of Medical Examiners** as the examination given to the applicant. This would enable an applicant to be licensed in Indiana without having to wait until the regular examination given by the Indiana board occurs.

Bill Enacted.—H. 30 was approved February 18. It requires all physicians to report within five days to the state board of health in writing the name, age and address of every person diagnosed as **a case of epilepsy** or similar disorders characterized by lapses of consciousness.

Iowa

Bills Introduced.—H. 236 proposes that a **handicapped child** need not submit to surgical intervention if it is against the wishes of the child's parents or guardians. H. 314 proposes the enactment of a **hospital survey and construction act** requiring a survey of existing hospital facilities throughout the state and the development of a program for the construction of additional facilities. The proposal would also require the appointment of a hospital advisory council and would appoint the commissioner of public health as the agent to apply for and receive federal funds to be used for assistance in the state survey or construc-

Acc-No. 58

tion program. S. 318 proposes the creation of a **state board of naturopathic examiners** and defines naturopathy as that system of the healing arts which means "nature cure or health by natural methods" and is defined as the prevention, diagnosis and treatment of human injuries, ailments and diseases by means of any one or more of the psychologic, physical or mechanical, chemical or material forces or agencies of nature.

Kansas

Bills Introduced.—H. 67, previously reported as a hospital licensing law, was amended in the house on February 18 to authorize the board of trustees of any **hospital to select the professional staff** members of the institution, provided that no rule or regulation shall be made which will discriminate against any practitioner of the healing art who is licensed to practice in the state. H. 178, to amend the medical practice act, proposes to require the appointment of **two osteopathic physicians** as members of the state board of medical registration and examination.

Bill Passed.—H. 102 passed the house February 11. It proposes to require all persons applying for a **marriage license** to present a certificate signed by a physician legally qualified under the laws of the state of Kansas or of the state in which he is practicing that the applicant is not infected with syphilis in such a stage as to make it communicable to a marital partner.

Massachusetts

Bills Introduced.—H. 1068 proposes to provide for the creation of a state institution to be known as the **University of Massachusetts** which would furnish instruction in medicine and other subjects. H. 1362 proposes to require persons purchasing **dogs or cats** to be used for experimentation purposes to keep a record of the same, which record shall be open to the inspection of the commissioner of public safety and all police officials of the commonwealth. S 391 proposes to require **food handlers to obtain a certificate from a duly registered physician certifying** that they are not infected with an infectious or communicable disease.

Michigan

Bill Introduced.—H. 166 proposes the creation of a board of **examiners for industrial medical assistants** and defines an industrial assistant as a person authorized by the state to administer first aid to sick and injured persons in an emergency occurring within the confines of an industrial plant under the supervision of a licensed physician and/or to care for the sick, the injured and persons afflicted with any human ailment, by attendance or the use of any therapeutic agent, in an industrial hospital or first aid station maintained by an industrial plant for the treatment of sick or injured persons under the direction and supervision of a licensed physician

Minnesota

Bill Introduced.—S. 572 proposes certain amendments to **the osteopathic law** which would create a state osteopathic board of examiners in medicine and surgery and would define osteopathy as "a complete school of medicine based upon the osteopathic concept which is different in emphasis from those principles recognized by other schools of medicine." The proposal would grant to osteopaths identical privileges with those now possessed by general practitioners.

Montana

Bill Introduced.—H 235 was previously reported as a hospital licensing proposal. A house amendment of February 14 proposes to add to the proposal a requirement that no person operating a hospital shall in any manner or by any device **discriminate between the patients** of any regularly licensed physician for or on any ground or reason whatever, including the fact that any such physician is not a member of the medical or surgical or other staff, clinic or internal instrumentality of the hospital.

Bill Passed.—S. 100 passed the senate February 21. It proposes that each applicant for a **marriage license** shall present a certificate signed by a duly qualified physician licensed to practice medicine and surgery in any state or territory of the United States or any person authorized by the laws of Montana to make such certificate certifying that the applicant has been given an examination for the discovery of syphilis.

New Mexico

Bills Introduced.—H. 148 proposes the creation of a board of **naturopathic physicians** and defines naturopathy as follows. "The term 'Naturopathy' as used herein shall comprehend, embrace and be composed of the following named acts, practices and usages, as set forth in the Act of Congress of the United States, enacted Feb. 7, 1931, H R 12169 defining Naturopathy. Diagnosis and Practice of physiological and material sciences of healing as follows,—The physiological and mechanical sciences such as mechanotherapy, articular manipulation, corrective orthopedic gymnastics, neurotherapy, psycho-therapy, hydrotherapy, and mineral baths, electrotherapy, thermotherapy, phototherapy, chromotherapy, vibrotherapy, thalmotherapy, and dietetics which shall include the use of foods of such biochemical tissue-building products and cell salts as are found in the normal body; and the use of vegetal oils and dehydrated and pulverized fruits, flowers, seeds, barks, herbs, roots, and vegetables uncompounded and in their natural state." S. 138 proposes an enabling act for the formation and regulation of **physicians' service plans.** S. 168 proposes the employment of a state **hospital advisory council** to draw up a program for construction of hospitals within the state and to administer state funds for such construction purposes.

Bills Passed.—S. 51 passed the senate February 20. It proposes to **define a clinic** as an establishment where patients are admitted for special study and treatment by a group of physicians practicing together and proposes further that no person or group of persons shall use the word clinic in connection with any establishment or office which does not come within such definition. S. 52 passed the senate February 20. It proposes to require all persons licensed to practice any of the healing arts to clearly **designate the school of medicine** or practice which such person is licensed to engage in and further provides that failure to comply with such restriction would constitute unprofessional conduct. S 53 passed the senate February 20. It proposes to authorize the use of **the injunctive process** to prohibit the illegal practice of medicine or the healing arts.

New York

Bills Introduced.—A. 1549 and S. 1508, to amend the education law, propose to require the annual **examination of all school children** for symptoms of tuberculosis A. 1569 proposes the creation of a **state science council** to act as the agency of the state in an examination and survey of advances and developments in the fields of theoretic and applied sciences and in the formulation of a long range scientific program designed to promote the health, welfare and safety of the residents of the state. A. 1703 and A. 1804 propose the creation of a temporary state commission to make a survey of the causes and effects of **heart disease,** rheumatic fever, rheumatic heart and kindred or related diseases. A. 1759, to amend the education law, proposes the creation of a **state board of chiropractic examiners** and defines chiropractic "as the science of locating and the removing of nerve interference in the human body, according to chiropractic principle, where subluxations of the vertebral column appear, or where interference, or misalignment is indicated. It excludes operative surgery, the reduction of fractures, the prescription of drugs or medicines, and the practice of obstetrics" S. 1402 proposes the enactment of a **disability benefit law.**

Oregon

Bills Introduced.—H. 275 proposes an act for the regulation, licensing and conducting of **clinical laboratories,** the licensing of clinical laboratory technologists and clinical laboratory technicians and the issuance of permits to physicians and surgeons conducting such laboratories. S. 287 would **prohibit chiropractors** from practicing medicine or obstetrics and from performing any type of surgery. It also proposes to eliminate from the existing definition of chiropractic the provision authorizing such practitioners to employ and practice physiotherapy, electrotherapy and hydrotherapy. S. 329, to amend the **basic science law,** proposes that any veteran who takes the examination and fails in any one subject may be reexamined in that subject alone at any time within twelve months.

South Dakota

Bills Introduced.—H. 50 proposes the enactment of a South Dakota **hospital survey and construction act.** A house amendment of February 21 to this proposal would require any institution accepting federal funds for construction purposes to first agree that it would not discriminate between practitioners of the various healing arts and that every duly licensed doctor of medicine, osteopathic physician and chiropractor should have the right to and should be entitled to practice his profession in any such hospital which had received federal funds. H. 302, to amend the basic science act, proposes to exempt therefrom any one who has served as a medical officer in World War II. S 184 proposes to prohibit the **sale of barbiturates** except on the original prescription of a practitioner, whom the proposal defines as a person licensed by law to prescribe and administer barbiturates.

West Virginia

Bill Passed.—H. 9 passed the senate February 19. To amend the medical practice act, it proposes to exempt therefrom the practice of the **religious tenets of any church** in the ministration to the sick or suffering by mental or spiritual means, provided sanitary and public health laws are complied with and provided no practices shall be used which may be dangerous or detrimental to life or health and further that no person shall be denied the benefits of accepted medical and surgical practices.

Bills Enacted.—H. 50 was approved February 13. It provides, among other things, that every physician practicing in the state shall report in writing to the board of control the name, age, sex, race, home address and type of disease of every person having **tuberculosis** who comes under his observation or care, within forty-eight hours after the discovery of this condition. S. 51 was approved February 18. It provides regulations for the **licensing of hospitals,** sanatoriums, rest homes and related institutions.

Wisconsin

Bill Introduced.—A. 231 proposes to authorize the formation of **cooperative associations** organized for the purpose of maintaining a nonprofit plan or plans for sickness care, including hospital care, for their members through contracts with physicians, medical societies, hospitals and others. The proposal would further require that no such plan would in any way interfere with the manner or mode of the practice of medicine, the relationship of physician and patient or the responsibility of the physician to a patient.

Wyoming

Bills Passed.—H. 63 passed the house February 14. It proposes amendments to the medical practice act which would require the **appointment of an osteopath** on the examining board and the licensing of applicants to practice osteopathy, which is defined as "the treatment of human ailments, diseases or infirmities by mechanotherapy, or by any means or method other than surgery or drugs." The amendments would also permit the use of injunctive process to restrain the unlicensed practice of medicine, surgery or osteopathy. S. 73 passed the senate February 20. It proposes the enactment of a state **hospital survey and construction act** requiring an inventory of existing hospitals and the development of a program for the construction of additional necessary hospital facilities. The proposal would also require the appointment of an advisory hospital council and provide for collaboration with the federal government in the application for and acceptance of federal funds to assist in hospital survey or construction within the state.

5

GOVERNMENT SERVICES

PUBLIC HEALTH SERVICE

ANNUAL REPORT OF PUBLIC HEALTH SERVICE

In the annual report of the U. S. Public Health Service the Surgeon General states that the fiscal year ended June 30, 1946 was notable for three milestones in the history of public health: (1) passage of the Hospital Surgery and Construction Act, (2) passage of the National Mental Health Act and (3) drafting a constitution for the World Health Organization.

The Hospital Survey and Construction Act provides for extensive federal aid to the states in surveying their needs for hospitals and health centers and for the construction of facilities to meet these needs.

The National Mental Health Act authorizes the appropriation of $7,500,000 for the construction of a National Institute of Mental Health which is to conduct research, serve as a national center for the coordination of research and the exchange of information and provide advance training for specialists in this field. The annual appropriation authorized for assistance to the states in their public health programs is increased by $10,000,000 to cover the new mental health activities.

The constitution of the World Health Organization, adopted at the international health conference of the United Nations in New York in July 1946, sets forth, the report states, a new philosophy of international health relations and establishes the framework for an organization of greater scope and authority than any previously created. The proposed functions go far beyond merely preventing the spread of disease. The intent of those who framed this constitution is that all existing international health agencies be brought into relationship with the new organization and that the way be left open for the admission of all nations, including nonmembers of the United Nations. The organization will come into being when its constitution has been ratified by twenty-six of the United Nations.

According to the report the provisional death rate for the United States, 10.6 per thousand, excluding the armed forces overseas, was in 1945 the same as in 1944; for the first five months of 1946 the rate showed a slight increase over the corresponding period of the previous year from 10.8 to 10.9. The stimulus given to tuberculosis control throughout the country is reflected in the fact that more than 700 miniature x-ray units are in use by hospital and voluntary agencies. A shift of emphasis has come about in the venereal disease control program, stress now being laid on the problems of finding new cases and of tracing and bringing to treatment as many contacts as possible. The community survey in which civic organizations, city authorities and the press are mobilized to support an intensive mass blood testing program is a new technic which has given excellent results. With the end of the war, malaria control activities have been redirected toward an attack on the permanent foci of malaria. This work and the programs for the control of typhus, dengue and other diseases of tropical origin will be carried on by the newly established communicable disease center in Atlanta, Ga., which also will provide specialized training for representatives of state and local departments and other federal agencies concerned with these diseases.

For the first time, funds for grants-in-aid to states for cancer control programs are specifically provided in the budget for the fiscal year 1946-1947, which allocates $2,500,000 for this purpose. Cancer control is also being aided by awarding traineeships through which physicians obtain clinical training in the diagnosis and treatment of cancer throughout the country. The wartime testing of antimalarial drugs has been continued at the National Institute of Health, where some drugs were found to be from 32 to 128 times as active as quinine. The Public Health Service continues to assign personnel to advise and assist numerous other agencies in the conduct of medical and public health programs. Officers were on detail during the year to nine departments and more than a dozen other agencies of the federal government.

A new division, the Division of Nursing, was established in the Office of the Surgeon General under the President's Reorganization Plan No. 2, effective July 16, 1946. The Public Health Service became the federal agency having chief responsibility for the collection, analysis and publication of national vital statistics.

The number of pieces of incoming mail and telegrams for the year totaled 1,101,509 and the outgoing correspondence 479,220. At the close of the fiscal year 2,512 officers were on active duty and 2,858 reserve officers were on the inactive list. Nurses, dietitians and physical therapists were commissioned in the regular corps for the first time under authority of the Public Health Service act of 1944. Through arrangements with the Army, the Public Health Service obtained 110 officers who were trained under the Army Specialized Training Program. Of 426 candidates examined for appointment to the regular corps, 182 attained passing grades. A total of 211 new appointments were made in the regular corps; and 401 reserve officers were appointed during the year, 1,221 reserve and 22 regular officers were relieved from active duty by retirement, resignation, termination or inactivation. Five U. S. Public Health Service officers were killed in service during the war. One officer died in a Japanese camp for prisoners of war and two captured by the Japanese at the fall of the Philippines and freed by American troops after more than three years' imprisonment have returned to duty.

The activities of the National Institute of Health, the research branch of the Public Health Service, are divided among nine coordinate units, the most recently established unit being the research grants office created under authority of Public Law 410. Another of the nine units is the National Cancer Institute. The Rocky Mountain Laboratory at Hamilton, Mont. which manufactured vaccines against spotted fever, typhus and yellow fever, is the sole producer of yellow fever vaccine in North America.

The graduate course on the study of continuous caudal analgesia for obstetrics, started in 1913 in cooperation with the Jefferson Medical College and the Philadelphia Lying-In Hospital, was transferred Dec. 1, 1945 to the University of Tennessee College of Medicine, Memphis. Two medical officers assigned there had by the end of the fiscal year supervised 950 continuous caudal analgesias in obstetrics and trained 250 physicians and 50 nurses in this technic. During this assignment at Philadelphia, Public Health Service officers supervised the administration of doses of caudal analgesia to 3,600 patients and trained 650 physicians and 50 nurses in the technic. The hospital division of the Public Health Service continued to provide professional care for the twenty-six marine hopitals, varying in size from 25 to 875 beds. Intern training approved by the Council on Medical Education and Hospitals of the American Medical Association is available in ten of the marine hospitals, and a total of 104 recent graduates completed this training during 1946.

During the year, for the first time, plague was diagnosed in rodents in Nebraska and Kansas and was also found among field rodents in Bannock County, Idaho, and Medicine Bow National Forest, Wyoming. The health department of California reported field rodents in several counties, and infected rodents were again found in certain districts on the island of Hawaii.

During the fiscal year a total of 760,000 new cases of venereal disease were reported from all sources to state and territorial health departments, an increase of 12.4 per cent over the previous year.

Numerous other activities of the Public Health Service are disclosed in this the seventy-fourth annual report of the U. S. Public Health Service and the one hundred and forty-eighth year of this organization's existence.

NAVY

SUSPEND PROFESSIONAL EXAMINATIONS FOR ACTING ASSISTANT SURGEONS

Secretary of the Navy James Forrestal has authorized the Bureau of Medicine and Surgery to suspend the professional examination of candidates for appointment to the regular Navy Medical Corps in the grade of Acting Assistant Surgeon. Determination of applicants' qualifications will henceforth be based on physical examination, personal interview and a review of the credentials of their officially compiled records. Suspension of the professional examination of applicants for the grade of Acting Assistant Surgeon now makes it possible for the applicants to be processed by the offices and branch offices of Naval Officer Procurement nearest them. Heretofore the professional examinations have been held at designated naval hospitals, often making it necessary for candidates to travel distances expending their time and money to take the examinations during a period of five days. It is to eliminate these undesirable features of procurement that the suspension of the professional examination has been effected.

Under present plans all phases of procurement processing, including physical examination, interview and compilation of credentials, will be accomplished by the offices of Naval Officer Procurement and their branches. A board convened in the Navy Department will review the reports and credentials submitted by the Procurement Offices and make final determination as to the physical and professional qualifications of candidates.

Suspension of the professional examinations as a part of the qualification procedure for appointment in no way lessens the standards prescribed for those applying for appointments as Acting Assistant Surgeons in the Navy Medical Corps, nor does it in any manner affect the professional examinations required of candidates for appointment to the grade of Assistant Surgeon following completion of internship. The revised procurement procedure does not alter the provision that candidates must have completed the third year of medical school in order to establish eligibility to apply for appointment as Acting Assistant Surgeon.

The intern training conducted in U. S. Naval Hospitals is rotating in character and of twelve months duration. Such naval hospitals as have applied for approval are now fully approved by the Council on Medical Education and Hospitals of the American Medical Association.

GENERAL HAWLEY LECTURES AT MEDICAL CENTER

The sixth in the series of lectures at the Naval Medical Center, Bethesda, Md., February 27 was given by Major Gen. Paul R. Hawley, medical director of the Veterans Administration, on the subject "Knowledge Gained with Respect to the Care of Casualties During the Late War." General Hawley during World War II was chief surgeon of the United States forces in the British Isles and later chief surgeon for the European Theater of Operations. Invitations to these lectures are extended to officers of the Army and Navy Medical Corps, Public Health, Veterans Administration and civilian physicians of the District of Columbia and Montgomery County.

MISCELLANEOUS

SALE OF SURPLUS MEDICAL SUPPLIES

The War Assets Administration announces, beginning February 10, a fixed price sale of surplus government property under the following general classifications: (1) surgical, medical and orthopedic appliances; (2) surgical and medical instruments, except diagnostic; (3) medical diagnostic apparatus and equipment; (4) hospital utensils.

This proprety is being offered to priority claimants, including veterans of World War II, and to the general public. Certified veterans of World War II should submit their orders in duplicate with their certificate. Veterans purchasing as dealers, jobbers or distributors, except exporters, must submit proof that they are financially responsible and have the necessary storage facilities and operate with proper permits and licensed to handle the property purchased and that they are not making drop sales of surplus property. It is necessary for veterans now holding certificates to purchase for resale to be recertified, and to submit the recertified certificate with their order to the Nashville Regional Office, Consolidated Vultee Building, Nashville, Tenn. (Reference Special Offering NVO-47-198, Feb. 7, 1947), which will give the location of these sales in Tennessee.

The War Assets Administration announces also the following sales of surplus government medical property:

Regional Office, 1409 Second Avenue, Seattle, bids closing March 10. Among the articles for sale are operating knives, bandages and first aid packets.

Little Rock, Arkansas Office, sale closes March 15. Among articles for sale are laboratory equipment, surgical dressings, eye, ear, nose and throat equipment, hospital equipment, surgical instruments, including sutures, and medical equipment.

Boston Regional Office, 600 Washington Street, Boston 11, sale closes March 14. Items for sale are sterilizers, surgeon's needles, duodenal tubes, extension apparatus, irrigators, hot water and ice bags and x-ray tables. Another sale announced by the Boston Regional Office closing March 24 includes electric vacuum pumps, surgical forceps and scissors, canvas litters, sterilizers, tissue retractor, operating knives, transformer for x-ray field unit, instrument cabinets and tables, hospital chairs, bandages and oak nurse's desks.

Omaha Regional Office, 501 W. O. W. Building, Omaha, sale closing March 12, includes x-ray field units, surgical instruments, therapeutic and operating lamps, instrument cabinets, food carts, bedside tables, folding oxygen tents, wheel chairs, sterilizers, audiometer and autoclaves.

Louisville Regional Office, 412 West Market Street, Louisville, Ky. Orders received after March 11 will be filled from remaining inventories on a first come first served basis. Included in the articles for sale are bougies, operating knives, bandages, catheters, trial lens cases, bone chisels, curets, periosteal elevators, surgical forceps, first aid kits, Steinmann pins, splints, stethoscopes, surgical sutures and a Kirchner wire drill.

War Assets Administration, Birmingham, Ala.: Immediately available for sale are the following items: cassette changer, stereoscopic upright, pedestal adjustable, magnetically controlled for remote synchronous operation with stereoscopic shift on table stand.

Physicians who are veterans have certain priority rights in purchasing this equipment.

ARTIFICIAL LIMBS WITH SUCTION SOCKETS

The Committee on Artificial Limbs of the National Research Council is supporting a program of research and development in fitting artificial limbs with suction sockets for above-knee amputees. The suction method of securing the artificial leg to the stump, although the subject of a United States patent in 1863, was apparently not used extensively until about seventy years later, when German limb makers began fitting such limbs to patients. Many successful cases were observed in Germany in the spring of 1946 by members of the Army Surgeon General's Commission on Amputation and Prostheses.

The committee has secured the cooperation of a number of limb manufacturers in various parts of the country in exploring the problem to determine particularly the factors contributing to the successful fitting and wearing of the prosthesis. By experimenting in several geographic locations it is hoped to determine whether there may be any adverse effects of climate on the wearing of such limbs. Each limb manufacturer engaged in the work has available an orthopedic surgeon as consultant who has been appointed by the Committee on Artificial Limbs. All technical information in possession of the committee is being made available to the manufacturers.

Although results thus far obtained in selected cases are highly encouraging, it should be made clear that the method is in the experimental stage and that it has not become standardized. A preliminary report will be prepared by the committee as soon as sufficient data have been obtained and analyzed.

The committee emphasizes that it has not approved the method for general use. Patients to be fitted should be selected only under the supervision of a competent surgeon and should be assured that the limb fitter is thoroughly informed about the fitting and construction of suction sockets.

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST: SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH.)

CALIFORNIA

Popular Medical Lectures.—Stanford University School of Medicine, San Francisco, will offer a series of popular medical lectures, illustrated, during March and April at Lane Hall on Friday evenings: March 7, "New Eyes for Old: Corneal Transplants," by Dr. Max Fine; March 21, "The War on Cancer," by Drs. David A. Wood, L. Henry Garland and Leonard G. Dobson; April 11, "Delinquency and Mental Health in a Changing World," by Dr. Hale F. Shirley, and April 25, "Contagion from Foreign Lands," by Dr. Rodney R. Beard.

Clinics for Children in Trailer Camps.—The Santa Clara County Health Department is arranging mobile clinics to provide service for children in rural areas. Well baby clinics will be held in a medical trailer made available by the Agricultural Workers Health and Medical Association through the state department of public health. Children living in some 580 trailer camp family units in rural areas of the county will be served in the hope of reducing the high incidence of diphtheria, diarrhea and other communicable diseases as well as the high infant mortality rate in this group of the population.

Personal.—William W. Greulich, Ph.D., professor of anatomy, Stanford University School of Medicine, San Francisco, and director of the Brush Foundation, has returned from Australia and New Zealand, where he lectured under the auspices of various postgraduate committees to chapters of the British Medical Association.——Dr. Wayland A. Morrison, chief surgeon on the Santa Fe Railway Hospital staff since 1921, has been appointed to the newly created position of medical director of the Santa Fe Railway, with headquarters in Los Angeles. He is a graduate of Stanford University, 1910, and Harvard Medical School, 1914, and is at present a commander in the Naval Reserve. As medical director of the railroad, Dr. Morrison will supervise the health of some 68,000 employees.

CONNECTICUT

Anatomist Receives Oxford Award.—Leon S. Stone, Ph.D., Bronson professor of comparative anatomy, Yale University School of Medicine, New Haven, will receive the Robert W. Doyne Memorial Medal, an annual award of the Oxford Ophthalmological Congress in England. Dr. Stone, who will go to England next summer to address the congress at Keble College, Oxford, was given the award in recognition of his work on retinal regeneration and vision experiments in transplanted eyes.

Management-Physician Conferences.—To further the interest of industrial managers in problems of employee health, the Industrial Health Committee of the Connecticut State Medical Society is sponsoring a program of management-physician conferences. A part of the society's public relations program, the conferences will be held at various industrial plants throughout the state. Dr. C. Frederick Yeager, physician for the Remington Rand Company, Bridgeport, is chairman of the committee.

ILLINOIS

President of Abbott Laboratories Dies.—Rolly M. Cain, president and general manager since March 1946 of Abbott Laboratories, North Chicago, Ill., died February 21 at Phoenix, Ariz., aged 65, of a heart attack. Mr. Cain was also a director of the American Pharmaceutical Manufacturers Association for a number of years and was its president in 1923-1924.

Scholarships to Provide Rural Physicians.—The Illinois State Medical Society has made public a proposal that the state legislature establish a revolving fund of $50,000 a year for ten years for education of physicians to serve in rural areas, as a means of relieving the shortage of doctors in downstate Illinois. The Committee on Rural Medical Service of the society (Dr. Harlan A. English, Danville, chairman) has been studying the problem for months, conferring with farm organization leaders and others. The funds proposed would be broken up into $7,000 maximum scholarships to be made to sons and daughters of Illinois rural families who meet preliminary educational requirements. The money would be returned to the fund by the beneficiary within a reasonable time after he is in practice, to be reused for another similar scholarship. The candidate would have to pass the admitting board of the University of Illinois College of Medicine, Chicago, as would any other intending medical student. The final condition would be the candidate's willingness to agree to practice in rural Illinois, at least until his scholarship is repaid. For purposes of the plan, rural Illinois is defined as including communities of fewer than 10,000 population.

KENTUCKY

Cancer Detection Clinics.—In cooperation with the Kentucky Division of the American Cancer Society the state health department has set up sixteen cancer detection and treatment clinics throughout the state at Ashland, King's Daughters' Hospital; Bowling Green, City Hospital; Covington, William Booth Memorial Hospital; Glasgow, T. J. Samson Community Hospital; Greenville, Muhlenberg Community Hospital; Henderson, Henderson Hospital; Hopkinsville, Jennie Stuart Memorial Hospital; Lexington, Good Samaritan Hospital; Louisville, St. Joseph Infirmary, Norton Memorial Infirmary, Red Cross Hospital and Louisville General Hospital; Middleboro, Middleboro Hospital; Owensboro, Owensboro-Daviess County Hospital; Paducah, Riverside Hospital, and Pikeville, Methodist Hospital. Physicians and county health officers refer cases of suspected cancer to these clinics, where x-ray, radium and surgery are available.

MARYLAND

Dr. Harkins to Go to Seattle.—Johns Hopkins University announces the resignation of Dr. Henry N. Harkins, associate professor of surgery, Johns Hopkins University School of Medicine and Johns Hopkins Hospital, effective as of July 1. Dr. Harkins has been appointed professor of surgery and executive officer of the department of surgery at the new medical school of the University of Washington, Seattle.

Health Officer to Retire.—The Washington *Post* reports that Dr. Elmer C. Kefauver, for twenty years health officer of Frederick County and also of the city of Frederick, plans to retire July 1 and that Dr. Donald J. Roop, New Market, who was recently appointed assistant county health officer, will succeed Dr. Kefauver when he retires. Dr. Roop is a graduate of the University of Maryland School of Medicine and served in the army during the recent war.

MASSACHUSETTS

License Revoked.—The Board of Registration in Medicine voted January 10 to suspend the license to practice medicine in the Commonwealth of Massachusetts of Dr. Marguerite F. Krausz, 8 Winter Street, Boston, for three months because of gross misconduct in the practice of her profession.

Tuesday Evening Lectures.—The Council of the House Officers' Association of Boston City Hospital is sponsoring a Tuesday evening lecture series in the new Cheever Amphitheater in the Dowling Building at 7 o'clock. The next two lectures are on March 25 and April 8. The March 25 lecture will be given by Dr. Cornelius P. Rhoads, director of the Memorial Hospital for the Treatment of Cancer and Allied Diseases, New York, on "Metabolic Aspects of Cancer," and will be discussed by Dr. Ira T. Nathanson of the Massachusetts General Hospital, Boston; the April 8 lecture by Dr. Wilder J. Penfield, Montreal, director of the Montreal Neurological Institute, on "Classification and Differential Diagnosis of the Epilepsies," will be discussed by Dr. William G. Lennox, Harvard Medical School, Boston, and the staffs of Children's and Boston City hospitals.

MICHIGAN

Industrial Meeting.—The Michigan Association of Industrial Physicians and Surgeons will hold its annual meeting in Detroit March 11 at the Shelby Hotel beginning at 10:30 a. m. Graduate and undergraduate educational opportunities in industrial medicine and recent advances in surgery and medicine will be the subjects of the program.

Personal.—Dr. William J. Jend, Detroit, was recently honored by the Detroit Police Department for driving an automobile forty-two years without a major traffic ticket for a distance just short of a million miles.——Dr. Kenneth B. Babcock has been named director of Grace Hospital, Detroit, succeeding the late Dr. John H. Law.

A Teaching Opportunity.—The Branch County Health Center and its staff have started a cooperative plan with the University of Michigan hospital under which the department of pediatrics at University Hospital will send a resident physician specializing in pediatrics to the health center. The plan calls for a rotation of the senior residents of the University Hospital every three months. The program has been designed as a teaching opportunity for both young specialists and the physicians of the county. The idea was initiated by the University of Michigan and the department of pediatrics in conjunction with Dr. Charles F. Wilkinson of the Kellogg Foundation, the coordinator at University Hospital for postgraduate training of Michigan physicians.

MISSOURI

Personal.—Dr. Richard A. Sutter, who was recently elected president of the St. Louis County Medical Society, is said to be the youngest president ever elected by that 44 year old organization. Dr. Sutter, 37, the son of the late Dr. John H. Sutter, who was president of the society in 1932, is a veteran of World War II.

University News.—A department of electroencephalographic technology will be established next fall at Washington University School of Medicine, St. Louis. The eight month course will begin October 1. Instruction will be given by Dr. James O'Leary, professor of neurology; George H. Bishop, Ph.D., professor of biophysics, and Dr. William H. Fields, assistant in neuropsychiatry.

NEW JERSEY

Hospital News.—In recognition of the forty years of distinguished service Dr. Berthold S. Pollak, Jersey City, N. J., rendered as medical director of the Hudson County Tuberculosis Hospital, the county's board of chosen freeholders has changed the name of the hospital to the Berthold S. Pollak Hospital for Chest Diseases.——An anonymous gift of $100,000 to Monmouth Memorial Hospital, Long Branch, toward construction and equipment of a surgical floor in honor of Dr. Harry B. Slocum, chief of staff, was announced February 13.

Dr. Allman Appointed to State Board.—Dr. David B. Allman, senior attending surgical chief at Atlantic City Hospital, has been appointed by the governor to the New Jersey State Board of Medical Examiners to succeed the late Dr. Samuel Barbash. Dr. Allman is on the staff of the Betty Bacharach Home for Afflicted Children, Longport; Atlantic County Hospital for Mental Diseases, and Atlantic County Hospital for Tuberculous Diseases, Northfield. He also is general chairman of the Local Committee on Arrangements of the Centennial meeting of the American Medical Association to be held in Atlantic City June 9-13.

NEW YORK

Narcotic Violation.—Dr. Frank E. Kellner, 214 West Court Street, Rome, pleaded guilty in the U. S. District Court in Albany to violation of the Federal Narcotic Law and on Dec. 10, 1946 was fined $2,000 and placed on probation for a period of two years.

Tuberculosis Conference.—The annual conference of the New York Tuberculosis and Health Association will be held Thursday, March 20, at the Pennsylvania Hotel, New York City. During the morning the Tuberculosis Sanatorium Conference of Metropolitan New York will present papers on the case finding program in New Jersey and on state legislation on tuberculosis as it affects New York City. A session on social hygiene will begin in the morning and run throughout the day. One session will discuss information services from the point of view of the community, the individual and the association. Another session, at 3 p. m., will be on health education. Dr. Harry S. Mustard, director, Columbia University School of Public Health, New York City, will speak at luncheon on "Toward a Better Public Health."

New York City

Change Name of Hospital.—The board of managers for the Home for Incurables, New York City, has authorized a change in name of the building, which hereafter will be designated "St. Barnabas Hospital for Chronic Diseases." However, the former corporate title will be retained for legal and fund raising purposes. Incorporated in 1866, it began as a small frame rented house with 33 patients cared for during the first year, to become a modern hospital for chronic illness with 455 beds and the Braker Memorial Home for old people.

Health Council of Greater New York.—An organization made up of twenty-nine official and voluntary agencies, known as the Health Council of Greater New York, has opened offices at 137 Centre Street, Manhattan. Dr. I. Ogden Woodruff, its president, said that the purpose of the organization is to enlist more public support for an enlarged public health program. The new council will be able to carry on research and study on a level impossible for individual organizations because of the cost. Among the agencies in the council are the North Shore and Central Queens Red Cross Chapters and the Catholic Charities of the Diocese of Brooklyn. Other agencies will be added as the work progresses. Dr. Woodruff is a member of the public health relations committee of the New York Academy of Medicine, professor emeritus of clinical medicine at Columbia University and a member of the staff of Bellevue Hospital.

NORTH CAROLINA

Gifts to Bowman Gray School.—Announcement was made January 2 of the establishment of a $1,700,000 endowment fund by Mr. James A. Gray, Winston-Salem, the income of which will go to eleven North Carolina colleges. The principal beneficiary of the endowment fund is the Bowman Gray School of Medicine of Wake Forest College, Winston-Salem, which was awarded $900,000 of the amount. On December 29 Dr. Coy C. Carpenter, dean of Bowman Gray School of Medicine at Wake Forest College, announced the gift of $60,000 from Mrs. Nathalie Gray Barnard for further support of the development of the department of psychiatry.

PENNSYLVANIA

Allergy Forum at Reading.—The Central Pennsylvania Allergy Association will hold its spring forum in Reading, March 26, at the Berkshire Hotel. The speakers are Dr. Bela Schick, lecturer, diseases of children, Columbia University, New York, "The Allergic Child and the General Practitioner"; Dr. Harold A. Abramson, assistant professor of physiology, Columbia University, "The Present Status of Allergy"; Dr. Harold L. Strause, associate in otolaryngology, St. Joseph Hospital, Reading, "Ocular Allergy"; Dr. Carroll S. Wright, professor of dermatology and syphilology, Temple University School of Medicine, Philadelphia, "Treatment of Various Allergic Dermatoses"; Dr. Harrison F. Flippin, associate in medicine, University of Pennsylvania School of Medicine, "What Price Sulfonamide and Antibiotic Therapy?" and Dr. Ralph M. Mulligan, chief of departments of allergy, St. Joseph and Community General Hospitals, Reading, "Thirty Questions and the Allergist." At a session in the morning at St. Joseph Hospital Dr. Stephen D. Lockey, Lancaster, president of the organization, will discuss the use of recent drugs in allergy and Dr. Arthur C. Kalisch, York, dust therapy. A dinner will follow in the evening. The fall meeting will be held at Harrisburg.

Philadelphia

Postgraduate Institute.—The eleventh annual postgraduate institute of the Philadelphia County Medical Society will be held at the Bellevue-Stratford Hotel, Philadelphia, April 15-18. Among the subjects to be discussed are thyroid problems, diabetes, vitamins, hormones, intestinal disorders, pathologic states of the kidney, peripheral vascular disease, antibiotics, hypertension, diseases of the lungs, neuropsychiatry, stomach and duodenum, allergy, skin disorders and otolaryngologic diseases. Two evening meetings on the subject of childhood and infancy disorders and obstetric and gynecologic problems will be held in the society's building. For further information write Dr. Gilson C. Engel, director, 301 South 21st Street, Philadelphia 3.

Temple University Appointments.—Dr. J. Robert Willson, Chicago, has been appointed head of the department of obstetrics and gynecology at Temple University School of Medicine and Hospital. A graduate of the University of Michigan School of Medicine, Dr. Willson continued on the staff of the University of Michigan until 1938, when he was appointed assistant professor of obstetrics and gynecology at the University of Chicago and Chicago Lying-In Hospital. His research work has been in toxemia of pregnancy and carcinoma. Dr. Valy Menkin has been appointed associate professor of experimental pathology in the medical department. Dr. Menkin graduated from Harvard Medical School, Boston, in 1922 and since that time has done research in experimental pathology in Harvard Medical School and in Duke University, Durham, N. C.

WASHINGTON

Voluntary Blood Donor Service.—Benton-Franklin Counties Red Cross, with the aid of local physicians, has established a voluntary blood donor service. The donors are given a physical examination and blood Kahn, Rh factor and hemoglobin tests and their blood is typed. A list is kept at Red Cross headquarters and at Our Lady of Lourdes Hospital, Pasco, so that blood donors are now available for the area twenty-four hours a day.

Postgraduate Course in General Surgery. — A postgraduate course in general surgery including orthopedics, neurology, bacteriology, obstetrics and gynecology, sponsored by the Washington State Medical Association, will be offered at King County Hospital, Seattle, March 3-29, to members of medical associations in Washington, Idaho, Montana, Oregon and British Columbia. For further information address Dr. John K. Martin, Washington State Medical Association, 327 Cobb Building, Seattle.

ALASKA

Survey of Alaskan Clams.—The territorial department of health in cooperation with other services and boards is conducting a survey to determine the prevalence of Gonyaulax catanella in the clams found in southeastern Alaskan waters. Gonyaulax toxin causes paralytic poisoning in man and the Federal Food and Drug Administration does not permit the sale in the United States of shellfish which show even a minimum amount of the toxin. Surveys will attempt to determine during what parts of the year the toxin is present in clams and in what areas the poisonous shellfish are found. It is hoped both to benefit the residents of southern Alaska economically and to assure the public at what periods of the year such clams can be eaten.

PUERTO RICO

Pharmacists Honor Dr. Moulton.—George A. Moulton, Pharm. D., Peterborough, N. H., president of the American Pharmaceutical Association and past president of the National Association of Boards of Pharmacy, has been made an honorary life member of the *Puerto Rico Pharmaceutical Association*, in recognition of his services to pharmacy on the island.

Director of Hospital Facilities Division.—The U. S. Public Health Service has announced the appointment of Dr. Eduardo Garrido Morales, Philadelphia, former health commissioner of Puerto Rico, to act as local director for the Hospital Facilities Division, U. S. Public Health Service, and to act also as consultant to antivenereal and antituberculosis programs that are being conducted in the island with federal and insular funds. Puerto Rico is entitled to an annual appropriation of $2,500,000 for these programs.

Public Health Association.—The sixth annual meeting of the Puerto Rico Public Health Association was held February 5-8 at the School of Tropical Medicine in San Juan, under the chairmanship of Dr. Angel M. Marchand, assistant commissioner of health, to discuss sanitary and public health problems. American physicians and engineers who attended as guests of the association were John M. Henderson, professor of sanitary engineering sciences, Columbia University, New York; John M. Hepler, engineering department, Michigan State Department of Health; Miss Pearl McIver, Nurses Office, U. S. Public Health Service; Dr. Elmer L. Sevringhaus, director of clinical research, Hoffman-LaRoche, Inc.; Brig. Gen. James S. Simmons, Harvard University School of Public Health; James H. Steele, D.V.M., consultant on Veterinary Medicine, U. S. Public Health Service, Washington, D. C.; William A. Sodeman, Tulane University of Louisiana School of Medicine, New Orleans; Dr. Francis J. Weber, Lansing, Mich., and Alfred J. Aselmeyer, U. S. Public Health Service, Washington, D. C.

GENERAL

Philip Levine Receives Award.—Dr. Philip Levine, one of three men credited with the discovery of the Rh factor in blood and director of the Ortho Research Foundation, Linden, N. J., received the annual scientific award of Phi Lambda, Kappa, national medical fraternity, January 1 at a dinner meeting of the society in the Hotel Biltmore, New York City.

National Negro Health Week.—The week of March 30-April 6 has been designated by the U. S. Public Health Service as National Negro Health Week. The special objective will be "communitywide cooperation for better health and sanitation." A health week schedule beginning with Sunday, Mobilization day, continues as Home Health day, Community Sanitation day, Adults' Health day, School Health and Safety day, General Clean-up day and Report and Follow-up day.

Special Society Meetings in St. Louis.—The meetings of the American Laryngological, Rhinological and Otological Society, Inc., will be held in St. Louis during the week of April 21. The American Board of Otolaryngology will meet April 12-20 at the Hotel Coronado; the American Otological Society, Inc., April 21-22; the American Laryngological Association April 23-24, and the Triological Society April 25-26, all at the Hotel Statler, St. Louis.

American College of Chest Physicians.—The thirteenth annual meeting of the American College of Chest Physicians will be held at the Ambassador Hotel, Atlantic City, N. J., June 5-8. A scientific program has been planned with prominent speakers from other countries. The examinations for fellowship will be held on June 5. Applicants for fellowship in the college who plan to take these examinations should communicate at once with the executive secretary, American College of Chest Physicians, 500 North Dearborn Street, Chicago 10.

Training in Nutrition.—The Robert Gould Research Foundation of Erlanger, Ky., has established for 1947-1948 two grants of $1,500 each for training young people in nutrition and ten grants-in-aid of research. These grants-in-aid are of $2,000 each and will be distributed equally in the following fields: (1) recognition of preclinical nutritional deficiencies; (2) human nutritive requirements; (3) the most effective technics for educating the public in nutrition; (4) improvement in the nutritive value of human food as grown; (5) improvement in the nutritive value of animal food.

Special Society Elections.—At the recent annual meeting of the Society of American Medical Colleges, Dr. Walter A. Bloedorn, dean of the George Washington University School of Medicine, Washington,, D. C., was named president-elect; Dr. Maxwell E. Lapham, dean of Tulane University of Louisiana School of Medicine, New Orleans, vice president; Dr. Fred C. Zapffe, Oak Park, Ill., secretary, and Dr. Arthur C. Bachmeyer, Chicago, treasurer.——At the annual meeting of the American College of Surgeons in Cleveland late in December Dr. Arthur W. Allen, Boston, was elected president.

Southeastern Surgical Congress.—The assembly of the Southeastern Surgical Congress will be held at the Brown Hotel, Louisville, Ky., March 10-12 under the presidency of Dr. Elmer L. Henderson, Louisville. A number of doctors from medical centers throughout the country and Canada will address the session. Among the subjects to be discussed are "Segmental Pulmonary Resection in Bronchiectasis," "Surgical Treatment of Peptic Ulcer," "Surgical Treatment of Hypertension," "Thrombin and Its Clinical Applications," "Etiology and Treatment of Vesicovaginal Fistula," "Carcinoma of the Breast," "Analysis of 1,100 Consecutive Thyroidectomies," "Obligations and Opportunities of the Industrial Surgeon" and "Carcinoma of the Lung: Diagnosis and Treatment."

National Council on Rehabilitation.—The annual meeting of the National Council on Rehabilitation, scheduled for April 29 and 30, has been planned in cooperation with the National Rehabilitation Association, whose annual meeting will follow immediately on May 1-3. Both meetings will be held in the Jefferson Hotel, St. Louis. Complementary programs will be presented by the two organizations. The council will offer papers on tuberculosis, heart disease and mental diseases; the association will cover the blind, deaf, cerebral palsied and epileptic. The council will discuss the evaluation of physical and mental disabilities, while the association will outline specific tools used in the rehabilitation process: counseling, tests and measurements, consideration of personality factors and selective placement, with an explanation of the importance of matching physical capacities appraisal with physical demands analysis. The association will give a detailed picture of such facilities as homebound workshops, rehabilitation centers and instructional programs. The speakers will include leading specialists in the fields of medicine, surgery and psychiatry.

Northern Tri-State Medical Association.—The seventy-fourth annual meeting of this organization, which includes Indiana, Ohio and Michigan, will be held April 8 in the Rackham Memorial Educational Building, Detroit. Among the speakers will be Dr. Winfred B. Harm, president, Wayne County Medical Society; Dr. William M. Tuttle, Detroit, Recent Advances in Thoracic Surgery; Dr. Jerome W. Conn, associate professor of internal medicine, University of Michigan Medical School, Ann Arbor, Treatment of Diabetes; Dr. Sprague H. Gardiner, Indianapolis, Management of the Menopause; Dr. William Magner, director department of pathology, St. Michael's Hospital, Toronto, Enigmatic Anemias; Dr. George F. Lull, Secretary, American Medical Association, Chicago; Dr. Frederick A. Coller, professor of surgery and chairman of the department, University of Michigan Medical School, Ann Arbor, Surgical Aspects of the Abdominal Wall; Laurence H. Snyder, Sc.D., professor of medicine (genetics) and zoology, Ohio State University, Columbus, Medical Genetics and Public Health, and Dr. Edward D. Spalding, professor of clinical medicine, Wayne University College of Medicine, Detroit, Recent Advances in Cardiology.

Hodgkin's Disease Research Foundation.—The formation of a nonprofit organization, the Hodgkin's Disease Research Foundation, Inc., has been announced. Its purposes are (1) the coordination of research in all aspects of Hodgkin's disease, (2) stimulation of scientific and public interest in the problems presented by the work of this foundation, (3) assistance in the dissemination of knowledge regarding the nature, cause and treatment of Hodgkin's disease, (4) exchange of views among persons or organizations engaged in research related to the objectives of this foundation, (5) procuring of assistance from persons best able to conduct research in the etiology and treatment of Hodgkin's disease, (6) education of the public in preventive measures which may develop from this study and (7) the raising of funds to further the aims of this foundation. The officers are Drs. Robert Chambers, chairman of the board, research professor of biology, New York University, New York; Herman A. Hoster, president, associate director of cancer research, Ohio State University College of Medicine, Columbus; Antonio Rottino, first vice president, pathologist, St. Vincent's Hospital, New York; Harry A. Rolnick, secretary-treasurer, Philadelphia, and Mr. John F. X. Finn, second vice president, associate professor of jurisprudence, Fordham University. The executive offices of the foundation have been established at St. Vincent's Hospital, Seventh Avenue and Eleventh Street, New York 11.

The 1946 Poliomyelitis Epidemic.—The National Foundation of Infantile Paralysis has published the list of states showing in order the incidence of poliomyelitis cases from Jan. 1 through Dec. 28, 1946.

Rank		Cases	Rank		Cases
1	Minnesota	2,832	26	New Jersey	260
2	Illinois	2,550	27	Tennessee	183
3	California	2,132	28	Georgia	171
4	New York	1,462	29	New Mexico	168

25	Pennsylvania	287			

Decline in Mortality from Syphilis.—The statistical bulletin of the Metropolitan Life Insurance Company for December reports that mortality from syphilis and related conditions has been declining almost continuously since World War I. From a maximum of 19.1 per hundred thousand policyholders in 1917, the age adjusted death rate declined to 5.1 in 1945. Mortality from syphilis not only continued its downward trend during the war but actually accelerated its decline during the period. The long term decline in death rate from syphilis represents especially the experience among white persons, but in the last decade substantial progress in reducing the mortality among Negroes has been made. The adjusted relative declines in general are found in early and middle adult life. The bulletin credits the intensive nationwide campaign in the past decade for the decline, increased funds from federal, state and local governments and the growth of legislation requiring complete tests for those contemplating marriage and for expectant mothers. Since 1937 the number of states requiring premarital tests for syphilis from both bride and groom increased from four to thirty-two. Thirty-five states now require antepartum tests for pregnant women. The bulletin also credits the control measures put into effect by military health officials in connection with civilian health authorities, discovery and treatment of very large numbers of cases brought to light through selective service examinations and the available new therapy.

Campaign for Trained Occupational Therapists.—The American Occupational Therapy Association is distributing "Occupational Therapy, A Pioneering Profession" to doctors, educators, public health officials, rehabilitation agencies, vocational counselors and others in a campaign to increase the ranks of trained occupational therapists. This drive spearheads the thirtieth anniversary of the American Occupational Therapy Association, which has worked to establish standards of training and qualification by engaging in research and spreading information concerning the use of occupational therapy as an adjunct of medicine. Registered occupational therapists now number 2,200, which is far short of the nation's demand for trained personnel. The rehabilitation program of the Veterans Administration alone calls for 1,300 by the spring of 1947. Milestones in the development of occupational therapy include the establishment in 1930 of a National Register of Qualified Occupational Therapists, published annually and designed to protect the standards of the profession, and the issuance in 1935 of "Essentials of an Accredited School of Occupational Therapy," set up by the Council on Medical Education and Hospitals of the American Medical Association. As a result of the latter, training centers for occupational therapy have grown from five independent schools in 1935 to twenty-five schools which now train students in medical information and a wide variety of arts and skills, leading to a diploma or certificate. Last month the new official publication of the American Occupational Therapy Association, the *American Journal of Occupational Therapy*, made its debut with six issues scheduled per year and subscriptions available to laymen as well as to professionals.

FOREIGN

Dr. Stoll Honored.—Dr. Arthur Stoll, Basle, Switzerland, internationally known authority in pharmaceutical chemistry, has been honored with the publication of a special anniversary issue of the *Swiss Medical Journal*.

Medical Aid to China.—The American Bureau for Medical Aid to China, New York, has taken steps this year to improve China's medical and public health facilities, Dr. J. Heng Liu, medical director of the bureau, announced January 3. The first is the establishment of the first penicillin plant in China at Peiping. Dr. Liu explained that penicillin is so scarce in China that its use is prohibited for treatment of venereal disease. The second step is a three year program to aid six Chinese medical colleges. Fifteen to twenty fellowship grants for visiting professors from the United States are included in the program.

Requirements for Presentation of Smallpox Vaccination Certificates.—The Secretary of State as of February 3 informed the Federal Security Administrator that the Republic of the Philippines has modified its requirements concerning the presentation of certificates of smallpox vaccination. According to present requirements, officers, crew members and passengers of all vessels clearing from United States ports for the Philippines are required to present satisfactory certificate of recent smallpox vaccination. "Satisfactory certificate of vaccination" means evidence of successful vaccination or evidence of immune reaction not more than one year prior to the actual date of presentation. Certificates issued by the United States Public Health Service, medical officers of the United States armed forces and other government agencies will be honored. Certificates issued by private physicians will be honored if written on professional stationery duly signed.

British Health and Tuberculosis Conference.—A conference on tuberculosis, arranged by the National Association for the Prevention of Tuberculosis of Great Britain, will be held in London from July 8 to 10 inclusive. Aneurin Bevan, M.P., minister of health, will speak on the subject of "Tuberculosis and the National Health Service Act." The sessions will include discussions on tuberculosis in the British commonwealth and the Colonial tuberculosis services; sanatorium design; after-care and rehabilitation; the psychology of tuberculosis; new discoveries in the prevention and treatment of the disease, and the National Health Service and its effect on tuberculosis schemes. Plans are being made for overseas guests to visit sanatoriums, hospitals and clinics and demonstrations of various kinds. The conference is open to both doctors and laymen. Further particulars can be obtained from the Secretary General, National Association for the Prevention of Tuberculosis, Tavistock House North, Tavistock Square, London, W. C. 1.

Marriages

Robert Matthews Leitch, Battle Creek, Mich., to Miss Lillian Badger of London, England, in Niagara Falls, N. Y., in November.

Wilks O. Hiatt Jr., Savannah, Ga., to Mrs. Harry Ripley Melton Jr. of St. Petersburg, Fla., September 23.

Edward F. Kelly, West Los Angeles, Calif., to Miss Evelyn Husby of Mount Vernon, Wash., November 3.

Stanley Eugene Huff, Bremen, Ind., to Miss Helen Barbara Leonard of St. Paul October 30.

Morris L. Friedman to Miss Jeanette Birenboim, both of Kansas City, Mo., October 20.

Peter D. Corsones, Rutland, Vt., to Miss Evelyn Larios of Kingston, N. Y., in September.

Thomas Manley, Tacoma, Wash., to Miss Virginia Draper of Yakima August 19.

Deaths

Raymond Sanderson, Jacksonville, Fla.; born in Scranton, Pa., Aug. 20, 1883; Johns Hopkins University School of Medicine, Baltimore, 1910; member of the American Medical Association and the Southern Medical Association; served as director of the Ontario, N. Y., Laboratory; organizer and director of the Ulster County, N. Y., Laboratory and director of the Vassar Hospital Laboratory in Poughkeepsie, N. Y.; during World War I served as chief of laboratory services at the base hospital in Camp Merritt, N. J., and in other camps; a leader in organizing the Jacksonville Reserve Officers Association and later served as its president; graduate of the U. S. School of Aviation Medicine at Brooks Field, Texas; in July 1930 commissioned as a flight surgeon with the rank of lieutenant colonel in the U. S. Army Reserve; at the outbreak of World War II was recalled to active duty as a colonel; placed on an inactive status by reason of his health; senior medical examiner for the Civil Aeronautics Administration in the state of Florida; died Dec. 10, 1946, aged 63, of arteriosclerosis.

Charles Edward Remy, Chicago; University of Nebraska College of Medicine, Omaha, 1910; fellow of the American Psychiatric Association; member of the American Hospital Association; charter fellow of the American College of Hospital Administrators; served as a lieutenant colonel in the medical reserve corps of the U. S. Army during World War I; at one time associated with the U. S. Public Health Service Reserve; formerly assistant director of the Michael Reese Hospital and superintendent of the Maxwell Street Dispensary; formerly assistant superintendent and clinical director of the Yankton State (S. D.) Hospital, superintendent of the Knickerbocker Hospital in New York and the Minneapolis General Hospital; died in the Wesley Memorial Hospital Dec. 16, 1946, aged 65, of coronary thrombosis.

John Albertson Sampson ⊕ Albany, N. Y.; Johns Hopkins University School of Medicine, Baltimore, 1899; instructor in gynecology at his alma mater from 1903 to 1905, clinical professor of gynecology from 1905 to 1911 and professor from 1911 to 1942, when he became professor emeritus of gynecology; past president of the American Gynecological Society; fellow of the American College of Surgeons; received the honorary master of science degree from Williams College, Union College and Rensselaer Polytechnic Institute; consulting gynecologist, Brady Maternity Hospital; for many years senior gynecologist at the Albany Hospital, where he died Dec. 23, 1946, aged 73, of cerebral thrombosis and left hemiplegia.

James Henry Randolph ⊕ Jacksonville, Fla.; Johns Hopkins University School of Medicine, Baltimore, 1904; at one time physician in charge at the State Hospital in Chattahoochee; served as head of the neurologic department of the old St. Vincent's Hospital from its inception; a member of the staff and at one time head of the department of neurology at St. Luke's Hospital; consultant in neurology at the Riverside Hospital; veteran of the Spanish-American War; for two years during World War II served as examining psychiatrist at Camp Blanding, Fla.; physician in charge of Dr. Randolph's Sanitarium; died Dec. 25, 1946, aged 70.

Carl Rossow Steinke ⊕ Akron, Ohio; University of Pennsylvania School of Medicine, Philadelphia, 1909; fellow of the American College of Surgeons; member of the American Association for Thoracic Surgery; member of the founders group of the American Board of Surgery; member of the House of Delegates of the American Medical Association in 1935 and from 1937 to 1945; at one time a fellow in surgery at the Mayo Clinic in Rochester, Minn.; served during World War I; on the staffs of the City Hospital, Edwin Shaw Sanatorium and St. Thomas and Children's hospitals; died Dec. 14, 1946, aged 63.

Frank Church O'Neil ⊕ Middletown, Ohio; Harvard Medical School, Boston, 1934; diplomate of the National Board of Medical Examiners; specialist certified by the American Board of Pediatrics; interned at the Long Island College Hospital in Brooklyn; served a residency at the Children's Hospital in Boston, Cincinnati General Hospital and the Children's Hospital in Cincinnati; on the staff of the Middletown Hospital, where he died Dec. 31, 1946, aged 39.

Joseph Corrigan Jr., ⊕ Conroe, Texas; Louisiana State University Medical Center, New Orleans, 1937; on the staff of the Montgomery County Hospital; died Oct. 28, 1946, aged 33, in an airplane accident.

James E. Douglass, Winnsboro, S. C.; Medical College of the State of South Carolina, Charleston, 1885; served on the exemption board during World War I; died Dec. 15, 1946, aged 82, of a hip fracture received in a fall and uremia.

Frank Ganes Dye, Skaneateles, N. Y.; University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, 1919; member of the American Medical Association; at one time health officer; served in the medical corps of the U. S. Naval Reserve during World War II; formerly on the staff of the City Hospital in Auburn and member of the board of managers of the Onondaga (N. Y.) County Sanatorium; died in the Crouse-Irving Hospital in Syracuse January 5, aged 54, of cerebral hemorrhage.

Daniel Alverson Eiseline ⊕ Shortsville, N. Y.; University of Buffalo School of Medicine, 1896; formerly county coroner; served during World War I; lieutenant colonel, medical reserve corps, not on active duty; member of the board of directors of Shortsville State Bank; on the staffs of the Thompson Memorial Hospital in Canandaigua and the Clifton Springs (N. Y.) Sanitarium and Clinic, where he died Dec. 27, 1946, aged 77, of carcinoma of the sigmoid.

Edwin Franklin Eshleman, Palmerton, Pa.; Jefferson Medical College of Philadelphia, 1893; member of the American Medical Association; died in the Palmerton Hospital Nov. 22, 1946, aged 81, of coronary occlusion.

De Koven Alexander French, Muskogee, Okla.; Howard University College of Medicine, Washington, D. C., 1928; died Nov. 29, 1946, aged 44, in an automobile accident.

Louis Henry Hempelmann ⊕ St. Louis; Washington University School of Medicine, St. Louis, 1896; assistant professor emeritus of clinical medicine at his alma mater; specialist certified by the American Board of Internal Medicine; member of the staffs of the Evangelical Deaconess Home and Hospital, Barnes Hospital and the Missouri Baptist Hospital; died Dec. 27, 1946, aged 73, of coronary occlusion.

Eugene Michel Holder ⊕ Memphis, Tenn.; Memphis (Tenn.) Hospital Medical College, 1894; professor of surgery at the University of Tennessee College of Medicine; fellow of the American College of Surgeons; on the staffs of the John Gaston Hospital and the Baptist Memorial Hospital, where he died Dec. 16, 1946, aged 77, of diaphragmatic hernia with gangrene and perforation of the stomach.

Nicholas Kalinowski, Chicago; Chicago College of Medicine and Surgery, 1914; served on the staff of St. Mary's Hospital; died Dec. 18, 1946, aged 61, of heart disease.

Johannes Jacobus Miller ⊕ Ackley, Iowa; Northwestern University Medical School, Chicago, 1899; local officer on the state board of health; local surgeon for the Illinois Central Railroad; on the staff of the Municipal Hospital in Iowa Falls; owner of the Miller Hospital; died Nov. 27, 1946, aged 71, of pulmonary edema and coronary arteriosclerosis.

Walter Marion Miller, Bala-Cynwyd, Pa.; Jefferson Medical College, Philadelphia, 1903; formerly affiliated with the medical division of the board of education of Philadelphia; died in Palm Beach, Fla., Dec. 29, 1946, aged 67, of coronary thrombosis.

Henry McKee Minton ⊕ Philadelphia; Jefferson Medical College of Philadelphia, 1906; served on the staff of the Mercy Hospital; died Dec. 29, 1946, aged 75, of heart disease.

Nathaniel Taylor Moore, Las Vegas, N. M.; University of Nashville (Tenn.) Medical Department, 1898; at one time secretary of the El Paso County (Texas) Medical Society; member of the American Medical Association; served during World War I; formerly affiliated with the New Mexico State Hospital; died in St. Anthony's Hospital Nov. 17, 1946, aged 79, of carcinoma of the larynx.

Frederick Scoville Nicoll ⊕ Berlin, Md.; Cornell University Medical College, New York, 1935; on the staff of the Peninsula General Hospital in Salisbury; president of the Eastern Shore Baseball League; died in the Abington Memorial Hospital, Abington, Pa., Dec. 30, 1946, aged 40, of carcinoma of the stomach.

Daniel Vincent O'Leary, Albany, N. Y.; Albany Medical College, 1904; member of the American Medical Association; served as city health commissioner; on the staffs of the Anthony N. Brady Maternity Home and St. Peter's Hospital, where he died Dec. 23, 1946, aged 67, of diabetes mellitus.

Ralph Wallace Reed ⊕ Cincinnati; Pulte Medical College, Homeopathic, Cincinnati, 1902; formerly professor of mental and nervous diseases at the Eclectic Medical College; served during World War I; died in the Bethesda Hospital Dec. 23, 1946, aged 66, of acute leukemia.

Walter Schilling ⊕ San Francisco; Harvard Medical School, Boston, 1925; assistant clinical professor of medicine at the Stanford University School of Medicine; member of the American Psychiatric Association; affiliated with the Stanford University Hospital; died Dec. 16, 1946, aged 54, of coronary disease.

Elmer Walfred Seaburg, Peoria, Ill.; Chicago College of Medicine and Surgery, 1917; member of the American Medical Association; served during World War I; affiliated with the Methodist Hospital; died in the Veterans Administration Hospital in Danville, Nov. 9, 1946, aged 54.

William Stacy Siler Jr., ⊕ Shreveport, La.; Tulane University of Louisiana School of Medicine, New Orleans, 1934; interned at Shreveport Charity Hospital; died in the Tri-State Hospital Nov. 22, 1946, aged 40.

Wayne Pulley Sirles ⊕ Herrin, Ill.; University of Illinois College of Medicine, Chicago, 1938; specialist certified by the American Board of Otolaryngology; interned at St. Louis City Hospital; served a residency at the Barnes Hospital in St. Louis, where he had been instructor in otolaryngology at the Washington University School of Medicine; served during World War II; on the staff of the Herrin Hospital; died Dec. 11, 1946, aged 34, of coronary occlusion.

Wesley Columbus Slate, ⊕ Spencer, N. C.; University of Tennessee Medical Department, Nashville, 1903; served as chief of staff at Rowan Memorial Hospital in Salisbury, where he died Nov. 7, 1946, aged 65, of heart disease.

Roy Clayton Smisson ⊕ Fort Valley, Ga.; Vanderbilt University School of Medicine, Nashville, Tenn, 1916; chairman of the Peach County Board of Health; member of the board of education of Peach County and Fort Valley, where he had been a trustee of the schools; served overseas during World War I; on the staffs of the Mercy Hospital and the Clinic Hospital in Macon, where he died Dec. 20, 1946, aged 54, of injuries received in an automobile accident.

Fred Alvah Sprague ⊕ Concord, N. H.; Baltimore Medical College, 1906; veteran of the Spanish-American War; served overseas during World War I; at one time a member of the local board of health; died Dec. 3, 1946, aged 73, of cerebral hemorrhage.

Alice Adele Squire, Brooklyn; New York Medical College and Hospital for Women, Homeopathic, New York, 1901; member of the American Medical Association; died in the Peck Memorial Hospital Oct. 4, 1946, aged 69, of obstruction of the jejunum.

Lieut. Alton C. Bookout (MC), U S.N, 1910-1945

Merrill Alpheus Swiney ⊕ Bayonne, N. J.; University of Pennsylvania Department of Medicine, Philadelphia, 1903; medical director and owner of the Swiney Sanatorium, where he died Dec. 7, 1946, aged 74, of cerebral hemorrhage.

Roy Anson Thornley ⊕ Chicago; Georgetown University School of Medicine, Washington, D. C., 1914; member of the American Psychiatric Association; formerly on the faculty of his alma mater; served during World War I; medical consultant for the U. S. Railroad Retirement Board; died Dec. 30, 1946, aged 59.

Byron Burns Thorpe, El Paso, Texas; Central College of Physicians and Surgeons, Indianapolis, 1905; member of the American Medical Association and the New Mexico Medical Society; past president of the Eddy (N. M.) County Medical Society; formerly affiliated with the Artesia Municipal Hospital; died Dec. 17, 1946, aged 66, of heart disease.

Charles Matthew Tierney, Harmony, Minn.; State University of Iowa College of Medicine, Iowa City, 1906; for many years president of the Granger (Minn.) Bank; died Oct. 5, 1946, aged 65, of pulmonary edema, Parkinson's syndrome and carcinomatosis.

Erich Urbach ⊕ Philadelphia; Medizinische Fakultät der Universitat Wien, Vienna, Austria, 1919; associate in dermatology and syphilology at the University of Pennsylvania School of Medicine; member of the board of regents of the American College of Allergists; co-author of "Allergy"; on the staffs of the University of Pennsylvania Hospital and the Jewish Hospital, where he died Dec. 17, 1946, aged 53, of coronary occlusion.

Ralph Emerson Utley ⊕ Harlingen, Texas; Bennett Medical College, Chicago, 1914; on the staff of the Valley Baptist Hospital, where he died Dec. 19, 1946, aged 71, of coronary occlusion.

Adalbert B. Vajda, Milwaukee; Univerzita Komenskeho Fakulta Lékárska, Bratislava, Czechoslovakia, 1920; died in St. Mary's Hospital Dec. 23, 1946, aged 56, of aortic insufficiency and myocarditis.

Victor Ernest Verne ⊕ La Canada, Calif.; University of Minnesota College of Medicine and Surgery, Minneapolis, 1906; served during World War I; died in a hospital at Pasadena Dec. 1, 1946, aged 63.

Benedict Vogt Jr., Gulfport, Fla.; Long Island College Hospital, Brooklyn, 1905; member of the Medical Society of the State of New York and the American Medical Association; served on the staff of the Lutheran Hospital in Brooklyn; died Dec. 23, 1946, aged 62, of chronic heart disease.

John Carroll Walters, Springfield, Ill.; Marion-Sims College of Medicine, St. Louis, 1895; member of the American Medical Association; past president of the Sangamon County Medical Society; died in Miami, Fla, Dec. 29, 1946, aged 74, of cerebral hemorrhage, hypertension and heart disease.

Captain Julian O. Long, M. C., U. S. A., (N. G.), 1908-1944

Richard Shelby Wilson, Milwaukee; Chicago College of Medicine and Surgery, 1914; affiliated with the Veterans Administration Hospital; served during World War I; died Nov. 6, 1946, aged 63, of coronary arteriosclerosis.

Arthur Wolf, Chicago; Friedrich-Wilhelms-Universität Medizinische Fakultat, Berlin, Prussia, 1920; affiliated with the Mount Sinai Hospital; found dead Dec. 17, 1946, aged 61.

KILLED IN ACTION

Alton Coleman Bookout ⊕ Lieutenant, M. C., U. S. Navy, Dallas, Texas; University of Tennessee College of Medicine Memphis, 1938; interned at the California Hospital in Los Angeles; entered the U. S Navy in 1939 as a lieutenant junior grade; medical officer assigned to duty on the U. S. S. *Pillsbury* in the Asiatic area; reported missing in action following the battle of Java the last of February 1942 and officially declared dead by the U. S. Navy Nov. 25, 1945, aged 32.

Julian Oliver Long, Albuquerque, N. M.; Baylor University College of Medicine, Dallas, 1933; interned at the Baylor University Hospital in Dallas; served as health officer of the third district in Albuquerque and the eighth district in Los Lunas; began active duty as a captain in the medical corps of the U. S. Army (National Guard) on Jan 6, 1941; died in the South China Sea Oct. 24, 1944, aged 35, while on board a Japanese prison ship which was sunk.

Foreign Letters

SWEDEN

(From Our Regular Correspondent)

STOCKHOLM, Feb. 14, 1947.

No Visitors Allowed in Stockholm Hospitals

The influenza epidemic in Sweden has reached such proportions that it has been necessary to close all the Stockholm ospitals to visitors. At first only the maternity wards were forbidden territory, but with the ever increasing number of cases f influenza throughout the town it was felt imperative to extend ne regulation to all hospitals for an indefinite period. A chief ontributing reason to this has been the fact that many members f the hospital staffs are themselves down with influenza at a ime when the full personnel is hardly able to keep up with heir work. Keeping visitors away means more time for them o attend to their duties and every minute is needed. Most stablishments with large numbers of workers have been badly it by the epidemic. The Stockholm Municipal Street Car Company, for instance, had almost half of its drivers absent ast week, necessitating warnings that the number of cars in ervice might have to be reduced. Since the cars are now dreadfully overcrowded, long suffering Stockholmers will have ven worse traffic conditions to struggle with. Many companies are now experiencing the highest rates of absence due to illness n the histories of the concerns.

Venereal Disease

The Swedish Medical Board recently requested that it be permitted to do away with some of the secrecy regulations on venereal disease in order to take measures against individuals who are continuing to contaminate others although aware of heir own infection. Physicians are now sworn to secrecy, but he board wishes to have the patients reported to the proper authorities in each region to facilitate follow-ups and legal intervention if necessary. It also requested a law providing that all ndividuals arrested for vagrancy be subjected to examination or venereal disease. It is, of course, the great increase in the number of cases of syphilis that has necessitated these measures. n 1945 about 1,350 new cases of syphilis were reported in Sweden, but only four or five hundred sources of infection were reported and examined. The other sources will remain unknown.

Red Cross Home for Tuberculous Children

The Swedish Red Cross, which has done notable work in eeding the children of Europe, is now planning a home on the Riviera for tuberculous French children. The sum of 200,000 kronor has already been granted by the Help to Europe Foundation to aid in the project. The intention is not to build a new building but to find suitable quarters and refurnish and equip hem. On completion the home will be run by French authorities, with support from the French government.

The Eastman Institute

Much has been written about the Eastman Institute in Stockholm, which provides free dental care to children between the ages of 3 and 15. The institute, incidentally, was made possible by the donation of $1,000,000 to the city of Stockholm by the American industrial magnate George Eastman. It was opened n 1936 and has been doing splendid work since then. But the Eastman Institute, like all other public polyclinics here, suffers from too many patients and too few staff members, the latter fact being due partially to the city salaries, which are too low. It is now necessary to register a child at birth if one expects o get dental attention for it by the age of 3. Mothers are complaining bitterly that just when a child's teeth need attention, at the age of 3, they are told that the waiting list is so long that they must wait at least two years more before being called. Only children with severe toothaches or acute infections are taken out of turn, infections which might not have occurred had the child been examined earlier. There are now 19,000 children waiting for their first treatment, and it is possible to take only a certain percentage of these 3 year olds each year. The institute admits as many as it can but of course can by no means cope with the demand. Should an unregistered child with an infected tooth be accepted for attention he gets that one tooth fixed or extracted with no examination made of any other teeth. Should a registered child be fortunate enough to be attended to he at least gets his other teeth examined while there. However, the situation being what it is, the institute advises parents to take their children to private dentists should they not be called during their third year of age. The increasing nativity rate is not likely to improve conditions.

THE NETHERLANDS

AMSTERDAM, Jan. 20, 1947.

Shortage of Doctors

Owing to the interruption of medical education during the war and to the increased needs of the army both in this country and in the East Indies, there is a shortage of medical men. In order to rationalize medical services during this (temporary) setback, legal measures of 1939 are being kept in force by the directorate of public health. Young doctors must send their personal data to the chief inspector of public health and put their services at the disposal of his department for the time being. They may be sent to such urban or mainly rural areas where doctors are missing to take care of their practices for the duration of their being in service. Fitness for military service may result in the incorporation of these young doctors in the army as officers of health.

Income Raised for Admission to Health Insurance

The national health insurance service has raised the level of minimal yearly income which determines admission to insurance to 3,500 guilders. By this act a large section of the people become eligible for health insurance. A considerable shift from private to insurance practice will result from this measure, since the income of the great majority of the families does not exceed this level.

Charles Herbert Best Awarded Honorary Degree

At the beginning of the year the customary public meetings of the senates were held in all Netherlands universities. The Amsterdam University commemorated its 315th anniversary. The Canadian ambassador was present as a representative of Charles Herbert Best, C.B.E., F.R.S., on whom the honorary degree of doctor of medicine was conferred. The pediatrician Professor S. van Creveld presented the degree, pointing out the great service rendered to mankind by the discovery of insulin by the Toronto group of workers.

Professors Retired

On January 1, Professor E. P. Snijders retired from the chair of tropical medicine at the University of Amsterdam. He is a reputed epidemiologist with a long service record in the Far East.

Professor G. van Rijnberk, emeritus physiologist at Amsterdam, has retired also from the post of chief editor of the *Nederlandsch tijdschrift voor geneeskunde.* He had been with this periodical since 1913. Under his editorship the journal was established in its own building and the number of subscribers rose from 3,000 to 7,500, which, in view of the Dutch speaking population of the world, is considerable. The supervising board has appointed Dr. D. Klinkert to be chief editor. It is stated that no major changes are contemplated in the editorial policy.

The Motor Component of Retinal Stimuli

In a dissertation presented to the Faculty of Medicine of Amsterdam, Dr. J. E. Winkelman has discussed the results of his extensive investigations on the motor component of retinal stimuli. The motor action of such stimuli manifests itself in four ways: (1) conjugated turning of both eyes in one direction, (2) opposite movements of the eyes (fusion movements in distance adaptation), (3) perception of a fictitious movement (reiterated bilateral or alternating unilateral visual stimuli) and localization of stimuli in space. In all these modalities of function there is a reflex mechanism whose receptive area is found in the retina. In carefully conducted experiments with suitable or adapted apparatus, slowly alternating haploscopic stimuli were reinvestigated and they were shown to result in the perception of a fictitious movement. With increasing frequency of these stimuli one of two possibilities is substantiated: either simultaneous vision of two separate objects or fusion to one object. Therefore simultaneity or fusion is each a borderline case of the fictitious movement. Whether one or the other of these alternatives occurs depends on the reflex pathway followed. According to Zeeman, who based his views on studies of strabismus, there are three functional possibilities of connecting the perceptions of the retinas: (1) cerebral coordination of the nasal and temporal halves of the retinas, resulting in a reconstruction of the image by way of cerebral proprioceptors, (2) parallel eye movement owing to the functional coordination of homonymous retinal hemispheres and (3) laterally discrepant image representation of noncorresponding retinal points. When simultaneity was observed, the second possibility is assumed as being substantiated, whereas fusion points to the third possibility. The experiments throw light on the question of the circumstances on which the occurrence of these alternatives depends. In a well lighted room haploscopic stimuli tend to produce simultaneity, whereas in a dark room the same type of stimuli would produce fusion. In the lighted room the surrounding objects were decisive for the kind of perception. This now has been put to the test by using in a dark room a peripheral stimulus whose image reached both retinas. A peripheral fusion resulted, and such a fusion proved to be able to inhibit the central fusion. As a result, simultaneity occurred in the dark instead of fusion. Stimulation of noncorresponding peripheral portions of the retinas results in motor impulses that condition turning the bulbs to the side. This is the peripheral fusion reflex. The conflict between peripheral and central fusion tendencies may terminate in the unison of stimuli into stereoscopic depth perception. This conflict between the motor impulses is therefore essential for physiologic depth perception. It was remarkable that even invisible peripheral stimuli (consciously not visible) were able to produce the motor impulses necessary for the conflict with the central fusion. From these observations the author was led to conclude that the site of retinal stimulation rather than any other character of the stimuli is decisive for its motor effect. Peripheral fusion seems to serve spatial orientation; central fusion is useful for other kinds of discrimination in the function of sight. In patients it was observed that the level of the eyes may show definite hyperphoria in the dark yet they were able to look straight in a well lit room. These and persons with strabismus seem to coordinate well their abnormal perceptions, but by haploscopic fictitious movements indications may be found of the degree of abnormality.

Shortage of Soap

A severe shortage of soap threatens the southeastern provinces of the Netherlands with endemic skin diseases, especially scabies. In Limburg, where as a result of heavy fighting in the war housing conditions are still deplorable, 15 per cent of the urban population are said to suffer from scabies.

MOSCOW

(From Our Regular Correspondent)

Dec. 21, 1946.

Increase in the Birth Rate in the Soviet Union

In 1946 as compared with 1940 the mortality of children in Leningrad diminished by 20 per cent and at present it is nearly 50 per cent lower than before the war.

In the town of Tbilisi, Georgia, during nine months of 1946 300 more children were born than in the corresponding period of the previous year. In this connection many new maternity homes and kindergartens were opened. In Riga during the same period 6,000 babies were born, compared with 5,211 babies during last year (there are approximately 22 births per day).

In 1946 about 120,000,000 rubles (about $24,000,000) was spent in Leningrad for mother and child protection, much more than expenditures for the same purpose in the previous year. According to the law relating to mothers of big families, these mothers received in Leningrad for the same period about 12,500,00 rubles (about $2,500,000).

The Third Session of the Academy of Medical Sciences

The third session of the Academy of Medical Sciences of the Union of Soviet Socialist Republics was held late in October 1946 in the Moscow House of Scientists. About 900 members and guests were present; thus it may be said that the session became a conference of the most prominent representatives of Soviet medicine.

The first three days were devoted to one of the basic measures of our health service—confirmation of the academy's five year plan. Its principal aim is to assemble scientific ideas and to determine interrelations between different lines of investigation with the aim of a complex and fruitful elaboration of a series of questions.

The problem of the higher nervous activity is based on the late Academician Ivan Pavlov's studies on conditioned reflexes. In its five year plan the academy will do everything possible for the greatest practical use of Pavlov's ideas in the clinic. The plan includes a thorough study of the war traumas, prevention and treatment of infections, children's mortality, tuberculosis, cancer and study of the organism's reactivity.

Four days of the session were devoted to eighteen scientific papers. Because of Academician Burdenko's illness his paper was read by Professor L. G. Smirnova. The material presented was devoted to contemporary problems of wound study and methods of treatment of wounds by intra-arterial penicillin and sulfonamide administration.

A member of the academy, Peter Zdrodovsky, who is studying problems of immunization and infection, recounted his studies on the reactivity of the organism. He expanded Pasteur's conception of the micro-organism's importance in infectious diseases, giving most attention to study of micro-organisms.

Academician Anichkov's paper was devoted to experimental autoinfection. In laboratory animals he produced experimental appendicitis, inflammation of the bile ducts and purulent pleuritis without exogenous provocation, by means of simply breaking the natural defensive mechanisms of the organism. The resulting diseases are similar to those in human beings.

At the first meeting, on the request of Academician Burdenko, who was seriously ill, Academician Nikolai N. Anichkov was elected president. He is famed for his researches in pathologic anatomy and pathophysiology, particularly on arteriosclerosis. For his works on the pathology of the cardiovascular system he was awarded a Stalin Prize.

At the meetings of October 28 and 29, out of 700 candidates nominated by different scientific organizations 3 new members and 45 corresponding members were elected. New academy members are Professor Alexander Vishnevsky, known for his method of anesthesia (the procaine block), Professor Richard

Fronstein, Soviet authority on urology and author of 125 scientific works on this subject and Professor Peter Kupalov, Academician Pavlov's pupil, author of 65 works and approximately 200 works on physiology conducted under his guidance.

November 2 a new first vice president was elected—Professor Alexei Abrikosov, specialist in pathologic anatomy. The vice presidents are members of the academy Nikolai Kuprianov and Ivan Davidovsky. Another member of the academy, Professor Vladimir V. Parin, was elected secretary.

The Death of Nikolai Burdenko

November 11 the Soviet surgeon and organizer of military medicine Academician Nikolai Nilovich Burdenko died in Moscow at the age of 68. During the first world war, when the Yuryev University was evacuated to Voronezh, Professor Burdenko proved himself a great organizer and excellent surgeon. Soon after the February Revolution of 1917, Professor Burdenko was appointed principal military health inspector of the Russian troops and in the civil war soon after organized the medical department in the Red army, then only being formed. He founded the Neurosurgical Institute of Moscow, the first Institute in Russia where complicated operations on the nervous system were performed.

During the second world war he not only performed numerous operations but was a leader of scientific and investigative work. With Burdenko's name are associated problems on shock, bullet wounds, deep tissue antiseptics and prophylaxis of severe complications of postoperative traumas. For his patriotic services he was decorated with many orders, including the title Hero of Socialist Labor.

BRAZIL

(From Our Regular Correspondent)

Rio de Janeiro, Feb. 12, 1947.

Tuberculous Infection in Porto Alegre University Students

Drs. Gumercindo Sayago, professor at the University of Cordoba, Argentina, and Antonio G. Arroyo, phthisiologist, Belem Sanatorium, Porto Alegre, have published a report of their tuberculin and x-ray investigation of 587 students of the medical, dental and pharmacy schools of the University of Porto Alegre. The city of Porto Alegre (population 285,000), capital of the state of Rio Grande do Sul, in the temperate southern part of Brazil, has had a tuberculosis death rate of about 400 per hundred thousand in recent years.

Mantoux tuberculin tests were made at first with 0.1 c. of old tuberculin diluted to 1 : 1,000; if a negative result was observed, a second test was performed with 0.1 cc. diluted to 1 : 10. The 95.8 per cent positive to tuberculin is in contrast to the 70 per cent positive among high school students and 86.1 per cent among college students of the city, according to results obtained by Sayago in 1944. The roentgenologic study of the same group disclosed that "inapparent" tuberculosis was rather rare (0.6 per cent of active lesions and 2.7 per cent of suggestive pictures), which seems somewhat in contradiction to the death rate in the city at large as well as to the rate of positivity to tuberculin. Sayago and Arroyo believe that a more accurate study of the students in that group of "suggestive" x-ray pictures, including a thorough bacteriologic examination of the gastric content, as well as a larger percentage of students of the last two years than that included in the investigation, would better explain this contradictory fact. At any rate the authors believe it would be hardly acceptable to explain the presence of so few active or suspected pulmonary lesions as the direct result of a rapidly evolving disease, such as reported by Edwards among the colored population of Harlem. The results of the present investigation seem to evidence the need of the establishment of a routine service of tuberculin-roentgenologic examination of both college and university students.

Congenital Papillary Melanosis

Dr. Paulo Filho, an ophthalmologist in Rio de Janeiro, has described the result of the clinical and pathologic examination of 1,000 eyes of 500 patients in whom both these organs were in good condition as far as ophthalmoscopy revealed. Of the thousand eyes 18, or 1.8 per cent, were found with congenital papillary pigmentation (0.9 per cent of the patients). The author believes that this relatively high frequency of melanosis has not been found by other practitioners because they have not had their attention concentrated on this objective. All the patients were white persons. According to the eye involved, in 12 patients the melanosis was present in the left eye (66⅔ per cent), in 5 patients in the right eye (27.8 per cent), and in one in both of the eyes (5.5 per cent). In reference to the position of the lesion in the papillary area, in 10 cases (55.5 per cent) the melanosis was in the temporal half, in 7 cases (40 per cent) the melanosis was in the nasal half, and in 1 case (5.5 per cent) in the vertical meridian. The histologic aspect was studied in 149 slides with material taken from 35 eyes in which there was a small portion of the optic nerve. Pigmented cells were found in 4 per cent of the slides, or in 14.3 per cent of the specimens; however, in no case was the pigmentation localized in the papillary tissue itself, being always behind the lamina cribrosa and the conjunctive fibers of the nervous bundles. The author does not believe that in the cases reported in the literature as having acquired pigmentation (traumatic and the like) the lesions have really this origin; he thinks that melanosis always existed before the injury. He concludes that malignant melanomas of the optic disk are directly derived from groups of cells congenitally existing in the papilla.

Dr. Fred L. Soper

The election of Dr. Fred L. Soper to the post of director of the Pan American Sanitary Bureau, succeeding Dr. Hugh S. Cumming, has been received with great pleasure by Brazilian physicians. As a representative of the International Health Division of the Rockefeller Foundation in Brazil, Dr. Soper proved to be an active and able sanitary worker, to whom the health of the country owes a great deal. Nobody will forget, as one leading representative of the medical profession said, that he was the driving force in the difficult campaign which succeeded in the eradication of Gambiae mosquitoes from the states of Ceará and Rio Grande do Norte, where they had been imported from Africa and were causing considerable damage to the population of the northeastern section of the country. At the head of the Pan American Sanitary Bureau, it is expected that Dr. Soper will be able to enlarge the usefulness of the organization in order to meet more effectively the urgent and important health problems of the South American peoples.

Brief Items

Dr. Enrique V. Sivila, professor of phthisiology, University of Sucre, Bolivia, left Rio de Janeiro for his country after a stay of several months at the Miguel Pereira Tuberculosis Hospital and the BCG division of the Ataulpho de Paiva Foundation of Rio de Janeiro.

Dr. J. Martagão Gesteira, professor of pediatrics at the University of Rio de Janeiro, has been appointed director of the Bureau of Child Welfare of the National Department of Health.

Dr. João Cardoso de Castro, surgeon of the Municipal Hospital of Rio de Janeiro, has been appointed professor of clinical surgery at the Faculdade de Ciencias Medicas, a medical school independent of the University of Rio de Janeiro.

The Hospital Santa Maria, a great municipal institution for the treatment of tuberculous patients, located at Jacarepagua, a suburb of Rio de Janeiro, has been provided with a new 50 bed pavilion for the special use of city employees.

Correspondence

FEE SPLITTING AND REBATES

To the Editor:—It is a sad commentary on the ethical conscience of the medical profession when public sentiment and resentment have to be invoked to overcome a malodorous practice which moral suasion within its own ranks has been found powerless to combat.

The public has recently been treated to an exposé that brought a shock to the laity and a blush of shame to every right thinking member of the medical profession. While it was commonly known—or at any rate suspected—that a number of physicians in special fields (this particular exposé referred to ophthalmologists only) were receiving rebates ("kickbacks") from manufacturing concerns, it was not generally realized how widespread this pernicious and reprehensible practice had become or how large a percentage of prominent specialists were to be found among the guilty. Explanations and justifications galore were forthcoming, but, far from their exhibiting a guilty conscience, the offenders in many instances brazenly wailed that a lucrative practice, long hallowed by usage and common consent, was not to be interfered with by reformers or snoopers. The wide publicity given this nefarious and dishonest business in the lay and medical press was a deserved rebuke, and the perpetrators can hardly ask for protection or support from fellow men who are believers in the sanctity of a code of ethical behavior.

Corrective measures are, of course, called for, and it is expected that the groups involved will hastily institute the needed steps to purge themselves of these frauds on the public. Theirs is the duty to demonstrate a moral awakening. Whether even this will be sufficient to stem the cupidity of those who place gross commercialization of medical practice above ethical behavior waits to be seen.

There is a clause in the Fellowship Pledge of the American College of Surgeons specifically making membership in that organization untenable to any one who has commercial relations with "makers of surgical appliances and optical instruments." However, no mention of such a practice as being an infraction of ethical principles is noted in the section on "Ethics and Ethical Relationships" as published in the American College's Manual of Hospital Standardization; and, after all, it is the Manual, and not the Fellowship Pledge, which is presented as a model for the guidance of hospital standards. The Manual is specific in its detail of rules of procedure and management for institutions of small and large bed capacity, but it is difficult to understand why the framers of this valuable guide failed to incorporate the same standard for membership on hospital staffs as is demanded for membership in the college. Specifically, mention is made only of the splitting of fees between physician and surgeon, thus singling out the surgeon alone as the potential offender. How long will ethical surgeons be content to see their specialty—and theirs only—besmirched by such an innuendo? (Parenthetically be it stated that I am not a surgeon.)

It is my conviction that if hospitals see a need to list any rules at all of moral conduct that are to govern their staff members they should go beyond the condemnation of fee splitting alone in an effort to keep their ranks unsullied. Let them boldly condemn other fraudulent methods that are known to be current practice. To this end I would propose that hospitals add some such paragraph as the following to the section relating to fee splitting, namely:

> Staff members shall pledge themselves not to receive or solicit rebates from any commercial medical or surgical house as partial compensation in lieu of or in addition to payment for professional services rendered a patient.

Such a pledge could and should be willingly subscribed to by all physicians of decent mind and intent. And such a provision, now in the Fellowship Pledge of the college but—strangely enough—omitted in the college's Manual for Hospital Standardization, if incorporated in the by-laws of all hospitals, will absolve the surgeon of the suspicion that he is the only practitioner who needs watching. And too, such a statement will define as dishonorable a deeply rooted practice that has tainted a noble calling and give courage to hospital authorities to deal with unethical infractions which they either have long recognized and to which they have given silent consent, or which they hitherto felt themselves powerless to combat. Failure of hospitals to take action is tacit condonation of an indefensible, pernicious practice.

ARTHUR J. PATEK, M.D., Milwaukee.

OCCURRENCE OF PSEUDOGLYCOSURIA IN PATIENTS TREATED WITH PENICILLIN

To the Editor:—Observations recently made on 2 patients treated with parenterally administered penicillin indicate occurrence of a source of error in the routine copper reduction clinical test for detection of glycosuria.

A boy aged 2½ years, acutely ill with severe infection and signs and symptoms of cerebral irritation, received 20,000 Oxford units of penicillin every three hours intramuscularly for a period of approximately eighteen hours; a routine laboratory test for sugar in the urine revealed 1 plus (blood sugar 0.090 mg. per hundred cubic centimeters).

A diabetic man aged 87, moderately acutely ill, treated for rhinopharyngitis and mild bronchitis with 300,000 Oxford units of penicillin in wax-oil given intramuscularly on three successive days and previously well controlled on insulin and diet, showed on the fourth day 3 plus and 2 plus reduction of copper sulfate of Benedict's solution, at the same time displaying signs and symptoms of hypoglycemia, relieved by administration of available glucose. Penicillin solution with a concentration of 10,000 Oxford units per cubic centimeter reduced copper sulfate of Benedict's solution in vitro. Control test of boiling the same Benedict's solution for six minutes did not show any change in the reagent.

EPHRAIM B. BOLDYREFF, M.D., Grand Rapids, Mich.

MEDICAL LITERATURE OF THE NETHERLANDS

To the Editor:—We wish to express our thanks to Mrs. C. A. Taylor for her very helpful suggestion in the February 1 issue of THE JOURNAL, page 345. During the war the Netherlands Government Commission for Scientific Documentation collected scientific periodicals for Holland. But, as Mrs. Taylor noted, the need for medical literature is tremendous. Though we have shipped much material, we were forced to disappoint many libraries and institutions because of our limited funds. Therefore we will be very glad to supply addresses and further information to physicians who are interested in helping their colleagues in the Netherlands. Or, if doctors will send old copies of THE JOURNAL (and other medical publications) to our New York address we will gladly forward them to Holland.

CONSTANCE H. KOUWER
Librarian, Netherlands Government Commission
for Scientific Documentation.
5th Floor, 10 Rockefeller Plaza,
New York 20.

INCOMPATIBILITY OF RUTIN AND SULFONAMIDES

To the Editor:—The increasing use of rutin will undoubtedly be stimulated even more by your editorial on rutin therapy, page 247 of the January 25 issue of THE JOURNAL. A recent development in the case which I reported and which you quoted in the editorial leads me to call attention to my experience. This development represents a potential pitfall which was most distressing to my patient; in reporting it I hope that others may avoid a similar difficulty.

My patient continued entirely well until the recent development of a urinary tract infection which led to the administration of sulfadiazine by his urologist. During the administration of the sulfadiazine the patient began to have nosebleeds again and evidence of major gastrointestinal hemorrhage. The latter finally required readmission to the hospital and three transfusions. In the meantime I got in touch with Dr. Griffith in Philadelphia and he advised me that he had had similar experience with sulfonamides interfering with the efficacy of rutin. With this information the sulfadiazine was discontinued, the dose of rutin was doubled and the bleeding promptly ceased with no recurrence since then.

The hemorrhage was so profuse, the danger to the patient's life so profound and his faith in rutin so disturbed, that I considered it desirable to send this communication to emphasize the apparent interference of sulfonamides on the action of rutin. As far as I know, sulfonamides can be given, but the dose of rutin should be doubled or tripled under such circumstances, and a careful watch should be maintained for bleeding.

SAMUEL D. KUSHLAN, M.D., New Haven, Conn.

COUGH SYRUP

To the Editor:—The editorial comment on the cough syrup in THE JOURNAL Dec. 28, 1946, requires some amendment:

I have been working on research with expectorant drugs for almost ten years in place of the six years mentioned. I did not assume that cough syrups were expectorant but rather tried to find out what value they have, if any, in the treatment of cough. I did not find that simple syrups act as expectorants but rather as demulcent antitussives. I have found that most expectorant drugs act reflexly from the stomach. Converting a dry cough to a "productive" cough is not, from my work, the action of expectorants. Practically all expectorants do not augment the volume of sputum ("expectorates") but rather soothe a cough by increasing the volume of respiratory tract fluid, which, in practically all cases, acts as a demulcent to the irritated lining of the respiratory tree and is not expectorated but rather carried up the trachea and then automatically swallowed.

ELDON M. BOYD, M.D., Kingston, Ont.
Professor of Pharmacology, Queen's
University Faculty of Medicine.

PREVENTION OF CONGENITAL MALFORMATIONS

To the Editor:—In reference to the article "Prevention of Congenital Malformations" which appeared in THE JOURNAL, Nov. 16, 1946, I should like to add that another factor which was not mentioned and which may play a role is radiation (x-ray) during the gestation period. I wrote you earlier about the role nutrition may play but was unable to give the reference to an article which appeared about four years ago. Neither of these factors probably has been fully evaluated in human beings and I hesitate to comment on their importance without having the original papers at my disposal.

HANS G. KEITEL, Lieutenant, M. C., A. U. S.
Station Hospital, Fort Hamilton, Brooklyn.

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

NATIONAL BOARD OF MEDICAL EXAMINERS
EXAMINING BOARDS IN SPECIALTIES

Examinations of the National Board of Medical Examiners and the Examining Boards in Specialties were published in THE JOURNAL, March 1, page 645.

BOARDS OF MEDICAL EXAMINERS

ALABAMA: Montgomery, June 24-26. Sec., Dr. D. G. Gill, 519 Dexter Ave., Montgomery 4.

ARIZONA: * *Endorsement.* Phoenix, April 1-2. *Examination.* Phoenix, April 5. Sec., Dr. J. H. Patterson, 826 Security Bldg., Phoenix.

ARKANSAS: * *Medical. Examination.* June 5-6. Sec., Medical Board of the Arkansas Medical Society, Dr. L. J. Kosminsky, Texarkana. *Eclectic.* Little Rock, June 5. Sec., Dr. C. H. Young, 1415 Main St., Little Rock.

CALIFORNIA: *Examination.* Los Angeles, March 10-13. Sec., Dr. Frederick N. Scatena, 1020 N. St., Sacramento 14.

CONNECTICUT: * *Medical. Examination.* Hartford, March 11-12. Sec. to the Board, Dr. Creighton Barker, 258 Church St., New Haven. *Homeopathic.* Derby, March 11. Sec., Dr. J. H. Evans, 1488 Chapel St., New Haven.

DELAWARE: *Examination.* Dover, July 8-10. *Endorsement.* Dover, July 15. Sec., Medical Council of Delaware, Dr. J. S. McDaniel, 229 S. State St., Dover.

FLORIDA: * Jacksonville, June 24-25. Sec., Dr. Harold D. Van Schaick, 2736 S. W. Seventh Ave., Miami 36.

GEORGIA: Atlanta and Augusta, June. Sec., State Examining Boards, Mr. R. C. Coleman, 111 State Capitol, Atlanta 3.

ILLINOIS: Chicago, April 1-3. Supt. of Registration, Department of Registration & Education, Mr. Philip Harman, Springfield.

INDIANA: *Examination.* Indianapolis, June. Exec. Sec., Board of Medical Registration and Examination, Miss Ruth V. Kirk, 627 K. of P. Bldg., Indianapolis.

IOWA: * *Examination.* Iowa City, March 17-19. Corresponding Sec., Division of Licensure and Registration, Mr. H. W. Grefe, Capitol Bldg., Des Moines 19.

KANSAS: *Examination.* Kansas City, March 25-26. Sec., Board of Medical Registration and Examination, Dr. J. F. Hassig, 905 N. Seventh St., Kansas City 10.

LOUISIANA: New Orleans, March 13-15. Sec., Dr. R. B. Harrison, 1507 Hibernia Bank Bldg., New Orleans 12.

MAINE: Portland, March 11-12. Sec., Board of Registration of Medicine, Dr. A. P. Leighton, 192 State St., Portland.

MARYLAND: *Medical Examination.* Baltimore, June 17-20. Sec., Dr. E. H. Kloman, 1215 Cathedral St., Baltimore. *Homeopathic.* Baltimore, June 10-11. Sec., Dr. J. A. Evans, 612 W. 40th St., Baltimore.

MASSACHUSETTS: Boston, March 11-14. Sec., Board of Registration in Medicine, Dr. H. Q. Gallupe, 413-F State House, Boston 33.

MINNESOTA: * Minneapolis, April 15-17. Sec., Dr. J. F. Du Bois, 230 Lowry Medical Arts Bldg., St. Paul.

MONTANA: Helena, April 1-2. Sec., Dr. O. G. Klein, First National Bank Bldg., Helena.

NEBRASKA: * *Examination.* Omaha, June. Dir., Bureau of Examining Boards, Mr. Oscar F. Humble, State Capitol Bldg., Lincoln.

NEVADA: *Examination.* Carson City, May 5. Sec., Dr. G. H. Ross, 215 N. Carson St., Carson City.

NEW HAMPSHIRE: Concord, March 13. Sec., Board of Registration in Medicine, Dr. John S. Wheeler, 107 State House, Concord.

NEW JERSEY: Trenton, June 17-18. Sec., Dr. E. S. Hallinger, 28 W. State St., Trenton.

NEW MEXICO: * Santa Fe, April 7-8. Sec., Dr. LeGrand Ward, 141 Palace Ave., Santa Fe.

NORTH CAROLINA: *Endorsement.* Winston-Salem, April 30, June 24. *Examination.* Raleigh, June 23-26. Acting Sec., Mrs. L. McNeill, 226 Hillsboro St., Raleigh.

NORTH DAKOTA: Grand Forks, July 1-4. Sec., Dr. G. M. Williamson, 4¼ S. Third St., Grand Forks.

OHIO: *Examination.* Columbus, June 17-20. Sec., Dr. H. M. Platter, 21 W. Broad St., Columbus.

OREGON: * *Endorsement.* Portland, April 25-26. Exec. Sec., Miss L. M. Conlee, 608 Failing Bldg., Portland 4.

PENNSYLVANIA: Philadelphia and Pittsburgh, July. Acting Sec., Bureau of Professional Licensi[illegible] Instruction, Mrs. M. G. Steiner, 351 Educat[illegible]

RHODE ISLAND: * Providence, [illegible] of Examiners, Mr. Thomas B. Casey, 366 Sta[illegible]

SOUTH CAROLINA: Columbia, June [illegible]. Sec., Dr. N. B. Heyward, 1329 Blanding St., Columbia.

SOUTH DAKOTA: * Pierre, July 15-16. Sec., Medical Licensure, State Board of Health, Dr. Gilbert Cottam, Capitol Bldg., Pierre.

WEST VIRGINIA: Charleston, March 31-April 2. Commissioner, Public Health Council, Dr. N. H. Dyer, State Capitol, Charleston 5.

---

* Basic Science Certificate required.

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

ARIZONA: March 18, Sec., Mr. Francis A. Roy, Science Hall, University of Arizona, Tucson.

DISTRICT OF COLUMBIA: Washington, April 21-22. Sec., Commission on Licensure, Dr. G. C. Ruhland, 6150 E. Municipal Bldg., Washington 1.

FLORIDA: May 31. Final date for filing application is May 16. Sec., Dr. M. W. Emmel, University of Florida, Gainesville.

IOWA: Des Moines, April 8. Sec., Dr. Ben H. Peterson, Coe College, Cedar Rapids.

MICHIGAN: Ann Arbor and Detroit, May 9-10. Sec., Miss Eloise Lebeau, 101 N. Walnut St., Lansing.

MINNESOTA: Minneapolis, April 1-2. Sec., Dr. Raymond N. Bieter, 105 Millard Hall, University of Minnesota, Minneapolis 14.

NEBRASKA: Omaha, May 6-7. Dir., Bureau of Examining Boards, State Department of Health, Mr. O. F. Humble, 1009 State Capitol Bldg., Lincoln 9.

OKLAHOMA: Oklahoma City, March 17. Pres., Dr. Sam A. McKeel, Ada.

SOUTH DAKOTA: Vermillion, June 6-7. Sec., Dr. G. M. Evans, Yankton.

TENNESSEE: Memphis & Nashville, March 24-25. Sec., Dr. O. W. Hyman, 874 Union Ave., Memphis.

WISCONSIN: Madison, April 12. Sec., Dr. William H. Barber, Scott & Watson Sts., Ripon.

Council on Medical Education and Hospitals

There has been considerable misunderstanding in some quarters as to the Council's policies and recommendations for basic science instruction in approved hospital residencies in the various special fields of medicine. The Council therefore submits the following statement for the guidance of hospitals and staff. It is anticipated that this statement, with perhaps minor modifications, will be incorporated in the next revision of the Council's Essentials of Approved Residencies and Fellowships.

Victor Johnson, M.D., *Secretary.*

APPLIED BASIC MEDICAL SCIENCES

Competence in any of the various specialties in clinical medicine requires a knowledge of the basic medical sciences employed in that specialty. Therefore, residency and fellowship programs acceptable to the Council and the American boards must provide for training in the applied basic medical sciences. Such training does not necessitate formal course work, specific assigned laboratory exercises or affiliation of the residency hospital with a medical school; it should be distinctly of an applied nature, closely integrated with the clinical experience of the resident.

Any resident seeking competence or certification in a specialty must be able to apply at least the following basic sciences to his special field of medicine: anatomy, bacteriology, biochemistry, pathology, pharmacology and physiology. Undergraduate education in an approved medical school provides a background for an understanding of these sciences, so that the special training of the residency should not include hasty and inadequate reviews of these subjects, but rather their application to a given specialty.

Anatomy.—Anatomy at the residency level may well be taught, reviewed or learned from the living body, on the operating or examining table or from the fresh tissues in the pathologic laboratory. More important in anatomic instruction of residents than an available anatomic laboratory are the attitude and enthusiasm of the hospital staff in availing themselves of opportunities to teach and learn applied gross and microscopic anatomy from clinical and pathologic material. Opportunities for anatomic dissection, when available, may be utilized for supplementary training.

Bacteriology.—The hospital facilities and professional personnel in bacteriology and in the allied sciences of parasitology, mycology, immunology and serology should be such as to afford the resident opportunity and incentive to broaden his existing knowledge in these subjects in the light of his special clinical assignments and interests.

Biochemistry.—The hospital biochemistry laboratory should provide the resident with opportunities to broaden his knowledge of biochemistry as related to such clinical problems as he may encounter in his specialty; for example, water balance, acid-base equilibrium, glucose tolerance and blood or urine levels of significant metabolic, nutritional or therapeutic elements. Such applied basic science work in biochemistry may be far more valuable than a superficial review course in the field.

Pathology.—In a well conducted department of pathology of an acceptable residency hospital there is opportunity for correlating much basic medical science material with problems of clinical medicine. Applied gross and microscopic anatomy may be effectively learned from necropsy and surgical specimens. The clinical-pathologic conference should and can be one of the most effective devices for correlation of the basic sciences with clinical medicine.

Pharmacology.—Since the principles of pharmacology are involved in every therapeutic administration of chemical substances to patients, the wards of the residency hospital provide very suitable opportunities for the resident to apply and expand the knowledge of pharmacology previously gained in medical school.

Physiology.—Historically, one of the most fruitful methods of investigation into the normal functions of the body has been the study of abnormality of function, to which the resident in clinical medicine is constantly exposed. Clinical medicine affords a rich field for the study of physiology and a potent stimulus to the resident to apply the basic principles of this science. Much of the equipment and special apparatus employed in clinical studies of the patient are likewise used in physiology, so that clinical studies provide ample opportunity and stimulation for the resident to supplement his knowledge of physiology with applications of the science to clinical problems. Encouragement and opportunity for an enlarged understanding of body function in health and disease should be part of the experience of the resident in any of the specialties in the course of his clinical work.

TEACHING AND INVESTIGATION

Residents and fellows should be assigned to teaching responsibilities as their experience increases. The stimulating teacher-student relationship should be part of the resident's experience, not only as the student of the attending physician, but as the teacher of interns and nurses and, in medical school hospitals, of junior and senior medical students.

When the facilities of an institution warrant, and when the residents are competent and interested, they should be encouraged to engage in research, not only as an educational experience, but to increase the effectiveness of the hospital and its staff in caring for the sick. Such investigation may take the form of research in the hospital laboratories or words, summaries of medical literature or the preparation of statistical analyses derived from the hospital record department.

Affiliation of a residency hospital with a medical school is not essential for an acceptable educational program. Those hospitals having such an affiliation are in a position to provide the interested resident with educational opportunities supplementary to the training required for competence in the specialty. Such opportunities lie particularly in the fields of advanced laboratory training and research. Qualified and interested residents and fellows should be encouraged to undertake research programs at medical schools, within the limitations of available facilities. Interruption of the hospital assignments with a period of research in a medical school basic science department may be of inestimable value, although such residency programs will probably be possible only in exceptional cases. While medical school affiliations have greatly strengthened residency and fellowship programs, most approved hospitals have been able to conduct acceptable programs without such affiliation.

Medical Motion Pictures

FILM REVIEW

Energy Release from Food. 16 mm., color, sound, 973 feet (1 reel), showing time twenty-six minutes. Produced in 1946, by Audio Productions, Inc. Procurable on loan from the Upjohn Company, Kalamazoo, Mich.

This film presents by means of animated diagrams a readily understandable explanation of the role of nicotinic acid, thiamine and riboflavin in carbohydrate metabolism. Attention is focused on those mechanisms which furnish energy for carrying out bodily functions. The diagrams cleverly illustrate some of the reactions understood with difficulty which involve enzymatic oxidation of carbohydrate by hydrogen transfer. The action of enzymes and the precise role of the B vitamins in their action are shown. In addition to the animated diagrams, a portion of the film is devoted to a short description of certain clinical conditions characterized by a deficiency of the B vitamins.

Portions of the picture would be terribly obvious to some audiences and beyond the comprehension of others. While it is impossible ever to satisfy critics on this point, it does seem that in the present case something could be gained by making two films, one definitely for circulation among medical students in their biochemistry course and nutritionists, the other for groups of practicing physicians assembled in county society meetings or at hospital staff conferences. The pictures of cheilosis are frankly hackneyed and no longer convincing in view of recent work indicating that it is an unreliable index of hypovitaminosis. The photography is excellent.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Medical Services: California Physicians' Service Not Engaged in Practice of Insurance.—The plaintiff, California Physicians' Service, filed suit for a declaratory judgment asking that its business and operations be declared to constitute neither the practice of insurance nor the corporate practice of medicine and surgery. From a judgment so finding the defendant, insurance commissioner, appealed to the Supreme Court of California.

The California Physicians' Service was organized by the medical profession in 1939 to meet the need of persons in the lower income groups for medical care and surgical service. It holds a certificate of compliance with the provisions of section 593a of the civil code, relating to health service corporations, issued by the state board of medical examiners. The incorporators were all officers and councilors of the California Medical Association, and the purpose of the corporation, as expressed by its articles of incorporation, is to establish a voluntary medical service plan, participated in by all doctors of medicine desiring to do so, which will enable the people of the state of California to obtain prompt and adequate medical attention and hospital care whenever needed on a periodic budgeting basis without injury to the standards of medical service, without disruption of the proper physician-patient relation and without profit to any agency, and will assure that all payments made by patients, except administrative costs, will be utilized for medical service and hospital care and not otherwise. To effectuate such an objective, the by-laws declare that every resident doctor of medicine who holds "a valid and unrevoked physician's and surgeon's certificate issued to him by the Board of Medical Examiners of the State of California shall be invited by the board of trustees to become a professional member . . . it being one of the fundamental purposes of this corporation that professional membership . . . shall embrace all legally licensed Doctors of Medicine . . ." The contract which the California Physicians' Service enters into with various groups throughout the state provides: the California Physicians' Service is acting as the agent of the group and of those of its individuals who become beneficiary members in California Physicians' Service for the purpose of securing to said members medical services through professional members of California Physicians' Service; hospital care may be obtained through nonprofit hospital service corporations operating pursuant to chapters 9 or 11A of part II, division II, of the insurance code of the state of California; each beneficiary member of California Physicians' Service shall be entitled, during the time that he is such a beneficiary member, to secure when needed, and for a period of not to exceed one year for any one illness or injury, medical and surgical services from those doctors of medicine in the state of California who are professional members of C. P. S.; the services offered to beneficiary members of C. P. S. are offered personally to said members by the professional members of C. P. S., and the right of said members to receive the same is not transferable. A substantially similar contract relating to a rural health service has been entered into between the plaintiff and the Farm Security Administration.

The defendant's major contention on appeal is that the California Physicians' Service is engaged in the business of transacting insurance and therefore is subject to the regulatory laws governing such corporations. The plaintiff, on the other hand, asserts that it is rendering personal service, as distinguished from indemnity, compensation for which is limited to the resources of a pooled fund; that the professional members, not the service, assume any and all risk; and that it is actually a producer-consumer cooperative. Furthermore, said the plaintiff, the state has declared that a nonprofit membership corporation may lawfully defray or assume the cost of medical and surgical services or render any such service.

The Supreme Court first pointed out that the legislature of California has defined insurance as "a contract whereby one undertakes to indemnify another against loss, damage, or liability arising from a contingent or unknown event." "Whether the contract is one of insurance or of indemnity," said one court, "there must be a risk of loss to which one party may be subjected by contingent or future events and an assumption of it by legally binding arrangement by another. Even the most loosely stated conceptions of insurance and indemnity require these elements. Hazard is essential and equally so a shifting of its incidence. If there is no risk, or there being one it is not shifted to another or others, there can be neither insurance nor indemnity. Insurance also, by the better view, involved distribution of the risk, but distribution without assumption hardly can be held to be insurance." The business of the California Physicians' Service lacks one essential element necessary to bring it within the scope of the insurance laws, said the Supreme Court, for clearly it assumes no risk. Under the provisions of the contracts or group agreements, it is a mere agent or distributor of funds. It does not promise the beneficiary members that it will provide medical care; on the contrary, "the services which are offered to . . . beneficiary members of C. P. S. are offered personally to said members by the professional members of C. P. S. . . ." The amount of compensation of the professional members is variable and may be high or low, depending on the incidence of sickness and the number of beneficiary members paying dues. Therefore all risk is assumed by the physicians, not by the corporation, and the only effect of requiring compliance with regulatory status would be to compel the acquisition of reserves contrary to the established method of operation. But there is another and more compelling reason for holding that the service is not engaged in the insurance business, said the Supreme Court. Absence or presence of assumption of risk or peril is not the sole test to be applied in determining its status. The question is whether looking at the plan of operation as a whole, "service" rather than "indemnity" is its principal object and purpose. Certainly the objects and purposes of the California Physicians' Service have a wide scope in the field of social service. Probably there is no more impelling need than that of adequate medical care on a voluntary, low cost basis for persons of small income. The medical profession is endeavoring to meet that need and unquestionably this is "service" of a high order and not "indemnity." Furthermore, the legislature by the enactment of section 593a of the civil code, with its express provision for limited regulation of nonprofit organization of a professional character by the attorney general and the particular professional board, necessarily intended that such organization should be exempt from regulation by the insurance commissioner. One of the reasons behind the declaration of the earlier cases that it was against public policy for a corporation to engage in the practice of medicine was that the control of its activities was placed in the hands of laymen. To allow the insurance commissioner to impose the extensive regulations provided for in the insurance code on the activities of the service would result in the same evil. This conclusion, continued the Supreme Court, becomes more apparent when the purpose and nature of many of the legislative requirements are considered, particularly those relating to the maintenance of reserves and to the regulation of investments and financial operations. The extensive insurance regulations are designed primarily to protect the insured, or the public, from the insurer. Such regulations become important only if the insurer has assumed definite obligations. Conversely, it is evident that they are not intended to apply where no risk is assumed and no default can exist. Furthermore, by the very nature of its operations, the service could not accumulate vast reserves. The flow of funds from patient to physician is on a monthly basis of pay as you go, and to require reserves would be a useless and uneconomic waste. For these reasons, the Supreme Court concluded, the plaintiff is not engaged in the business of insurance within the meaning of the regulatory statutes but is subject to the limited supervision provided by section 593a of the civil code, with which it has complied. Accordingly the judgment in favor of the plaintiff was affirmed. —*California Physicians' Service v. Garrison, Insurance Commissioner, 172 P. (2d) 4 (Calif., 1946).*

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1937 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied with stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

American J. Digestive Diseases, Fort Wayne, Ind.

13:373-398 (Dec.) 1946

Modification of Plummer's Dilator for Treatment of Cardiospasm. E. Lundsteen.—p. 377.

Cancer of Stomach. J. A. Reed.—p. 379.

Effects of Polysaccharides on Appetite and Efficiency of Food Utilization in Growing Rat. B. H. Ershoff and H. B. McWilliams.—p. 385.

Gastragogue Effect of Laxatives and Allyl-Bromide Mixture. H. M. Feinblatt and E. A. Ferguson Jr.—p. 386.

Anal Fissure. D. C. Ditmore.—p. 391.

Toxic Sulfonamide Colitis.—Gauss and Weinstein report the histories of 3 patients who developed toxic colitis following oral administration of sulfonamides. In 1 patient sulfathiazole had caused the colitis and in the other 2 sulfapyridine. The 3 patients presented singularly similar clinical pictures of the digestive tract. Sigmoidoscopy showed a granular swollen hemorrhagic mucosa to the full length of the 25 cm. scope. The patients all had a diarrhea with frequent hemorrhagic stools associated with severe abdominal cramps. With the withdrawal of the sulfonamides the symptoms subsided and the colon returned to its normal appearance.

American Journal of Ophthalmology, Cincinnati

29:1355-1498 (Nov.) 1946

Chemical Burns of Rabbit Cornea. C. P. Carpenter and H. F. Smyth Jr.—p. 1363.

Further Observations on Aqueous Veins. K. W. Ascher.—p. 1373.

Experimental Dinitrophenol Cataract. J. W. Bettman.—p. 1388.

Cataracta Glaucomatosa Acuta. H. S. Sugar.—p. 1396.

Determination of Ocular Tension and Rigidity in Rabbits. E. Schmerl and B. Steinberg.—p. 1400.

*Autonomic Nervous System in Ocular Diseases. D. O. Harrington. —p. 1405.

Pemphigus Conjunctivae: Report of 3 Cases. F. W. Newell and J. S. Greetbam.—p. 1426.

Effects of Atabrine on Human Visual System. L. R. Dame.—p. 1432.

Dust Borne Infection in Ophthalmic Surgery. M. H. Post.—p. 1435.

Chemical Burns of Human Cornea.—From a study of 500 consecutive cases of chemical burns of the cornea, McLaughlin concludes that: 1. Immediate first aid, followed by long flushing with water, is of the utmost importance; no attempt at neutralization is recommended. 2. Specialized treatment by an ophthalmologist should be given within two hours after the injury; further delay threatens recovery of full vision. 3. Denudation is the treatment of choice; 456 cases healed in forty-eight hours with no loss of vision, 37 healed slowly but without loss of vision and 7 cases healed with a residual loss of vision. The loss of vision in all 7 cases was the result of inadequate preliminary care or health conditions present before the eyes were burned.

Autonomic Nervous System in Ocular Diseases.—Harrington discusses these ocular manifestations of dysfunctions of the autonomic nervous system: central angiospastic retinopathy, ocular changes in Raynaud's disease, amaurosis fugax, migraine and commotio retinae. Typical case reports of each condition are presented. It is emphasized that the differences between amaurosis fugax, central angiospastic retinopathy and Raynaud's disease are only of degree. Migraine is a cerebral vasospastic disturbance with predominant ocular symptoms. Commotio retinae, which embraces all conditions producing retinal edema from chemical vasomotor disturbances, is a local rather than a general autonomic response. Psychic trauma in a susceptible individual can produce as profound organic changes as extremes of temperature, anoxemia or direct physical trauma.

Effects of Insulin on Increase in Liver Fat Produced by Anterior Pituitary Extracts. J. Campbell.—p. 742.

Alveolar Carbon Dioxide Tension and Decompression Sickness.—Hodes and Larrabee say that cyclic and diurnal changes suggest that susceptibility to decompression sickness is influenced by physiologic factors which vary in a similar fashion. They investigated the relation between alveolar carbon dioxide tension and susceptibility to decompression sickness by comparing the carbon dioxide tension in alveolar air collected shortly before decompression with the ability of the subject to remain for two hours in an altitude chamber at a pressure equivalent to 38,000 feet. They found that susceptibility increases with alveolar carbon dioxide tension. Subjects were forced to descend whenever the alveolar carbon dioxide tension was more than 43 mm. of mercury. In contrast, no subject was forced to descend when his alveolar carbon dioxide tension was less than 38 mm. of mercury. Each subject whose tolerance varied during the course of these experiments passed fewer tests when his alveolar carbon dioxide tension was high than when it was low.

Body Measurements in School Health Program.—Stuart and Meredith consider it desirable that school health services take body measurements of all school children once or twice yearly. Interpretation should take into account the position held by each child in each measurement at each examination in relation to the ranges of variability for sex and age. It is important that all measurements be taken carefully according to the procedures used in establishing the norms. The physician should have these data in hand at the time of examinations and evaluate them in the light of clinical observations. It is proposed that weight, height, hip width, chest circumference and leg girth be adopted as basic measurements. Manifest changes should lead to special examinations if they would not otherwise be made routinely.

Varieties of Coccidioidal Infection.—By a program of systematically testing with coccidiodin new permanent personnel at four San Joaquin Valley army air fields and periodically retesting those originally negative, Smith and his associates ascertained the proportion of the various types of coccidioidomycosis. Sixty per cent of 1,351 infections were symptomless, and only 25 per cent of the infections were clinically manifest. Erythema nodosum occurred in 4.6 per cent. Disseminations occurred in about 1 per cent of the clinically manifest infections in the white males and 0.25 per cent of their total infections. The disseminations were over ten times as frequent in the Negro males, occurring in about 12 per cent of the clinical cases and in about 3.5 per cent of the total infections. Progressive coccidioidomycosis is analogous to the overwhelming tuberculosis of infancy and early childhood rather than with the reinfection type of tuberculosis. White persons have not had the generations of experience with Coccidioides which would enable them to become better adapted to survival. Their contact with Coccidioides is as virgin as that of the Negro.

Trichinosis in New York City.—Shookhoff and his associates say that during February and March 1945 New York City experienced the largest outbreak of trichinosis in the history of its health department. Eighty-four persons became ill with the disease as the result of the consumption of pork products supplied by a single wholesaler. The trichinosis resulted chiefly from the consumption of uncooked sausage type of pork. The most common type of onset was with edema of the eyelids and fever. Gastrointestinal symptoms occurred in a minority of the cases. Eosinophilia was the most constant early laboratory finding. The precipitin test was found more useful than the intradermal test in diagnosis, since it became positive earlier. There were no fatalities.

Tetanus a Preventable Disease.—According to Glenn the protection of the American soldier against tetanus by active immunization with tetanus toxoid during World War II is one of the most successful projects yet demonstrated in the field of preventive medicine. The high incidence of the disease among the civilian casualties in the battle for Manila (1945) is evidence that danger exists for the unimmunized. Present day mortality rates indicate that the disease is best controlled by prevention rather than treatment of a curative nature. Immunization of all school children with tetanus toxoid should result in a decrease in the number of deaths that occur each year from the disease.

Composite Free Grafts of Skin and Cartilage.—Brown and Cannon direct attention to a type of free graft from the ear, consisting of two surfaces of skin and intervening cartilage. They present drawings of operative procedures and illustrations of clinical results in restorations of the border of the nose and the columella.

Effects of Animal Tissue Extracts on Wound Healing.—Hoffman and his associates present experimental and clinical evidence which indicates that there is an active growth promoting factor present in adult sheep heart extract. A method is presented whereby adult sheep heart extract may be prepared in large quantities and thus be available for clinical use and experimental study. This extract appears to exert a stimulating effect on indolent human wounds and a lesser effect on wounds of normal healthy persons. The active factor appears to be a protein having many characteristics of an enzyme.

Use of Pressure Bandages in Treatment of Pemphigus: Report of Case. Kathleen A. Riley.—p. 711.

Dermatitis Venenata from Marine Animal Contact.—De Oreo reviews observations on 52 cases which indicate that dermatitis can be produced by contact with the small marine animal of the genus Halecium. The reactions are for the most part local in character but occasionally may be generalized and accompanied with moderate systemic reactions, the latter resulting possibly from former sensitization.

"Fixed" Eruption Caused by Sulfadiazine.—According to Cole the commonest reactions to sulfadiazine are macular eruptions, febrile reactions and conjunctivitis, whereas "fixed drug" eruptions are rare. The author describes 3 cases in which both phenomena existed: fixed eruptions of the mucous membrane and the skin caused by sulfadiazine therapy.

Atopic Dermatitis of Hands Due to Food Allergy.—Rowe thinks that "eczematoid" dermatitis of the hands may be due to atopic allergy to food more frequently than has been realized. This opinion is based on the control and reproduction of dermatitis of the hands by the elimination and later by the reintroduction of allergenic foods into the diet of 80 patients in a series of 182 patients with dermatitis of the hands seen in private practice of allergy. Atopic dermatitis of the hands due to allergy to inhaled pollen as a major or secondary cause also occurred in 22 of these patients. Irritations of the skin of the hands from housework especially and also from other occupations and avocations help to activate a potential sensitization to food in the skin.

Potency of Penicillin Under Various Storage Conditions Against Hemolytic Staphylococci.—Pelczar and Barefoot stress that all penicillin preparations should be kept at refrigerator temperature. Aqueous solutions of penicillin should be prepared fresh at least every three days, regardless of the type of storage. When kept at refrigerator temperature, penicillin in the water soluble bases tested retains sufficient antibacterial activity to be effective after one month. At room temperature the decrease in potency after two weeks is sufficient to render the preparations ineffective therapeutically. It appears that in the case of highly porous water soluble bases the rate of destruction of the antibacterial activity of penicillin is slightly greater near the surface than at the bottom of the container when storage is at room temperature.

Electromyography in Differential Diagnosis of Ruptured Cervical Disk.—Brazier and her associates state that the electromyograph can be used as a delicate tool for the detection of fasciculations in muscles not obvious to the eye. In the present study 10 cases of suspected compression of nerve roots by protruding intervertebral disks have been reviewed in the light of their electromyographic findings. In 9 of these 10 cases operation was performed, and therefore confirmation of the segmental involvement was furnished by operative observation, the other case having confirmation by myelographic studies. In 2 cases of suspected ruptured disk with normal electromyograms no lesion of the disk was observed at operation. The electromyographic findings in these cases are also compared with those in cases of anterior horn cell disease in progressive muscular atrophy.

Cerebral Dysrhythmia and Psychopathic Personalities.—Simon and his associates obtained electroencephalographic tracings from 96 of a series of 104 patients with a disorder diagnosed as constitutional psychopathic state in a military setting. The personalities were evaluated first by psychiatric criteria, so that the finding of electroencephalographic abnormality did not influence diagnostic judgment. The percentage of abnormal records did not greatly exceed the reported incidence of abnormality in normal control groups although there was a higher percentage of records with F-2 and S-2 frequencies than has been obtained for normal controls. The authors find no relationship between the severity of manifestations of psychopathy and the incidence of abnormality in records.

*Fibrinogen Plastics: Tissue Reactions Induced by a Series of Fibrinogen Plastics Implanted in Abdominal Wall of Guinea Pigs. O. T. Bailey and R. Ford.—p. 535.

Sudden and Unexpected Deaths of Young Soldiers.—Moritz and Zamcheck say that survey of the postmortem material at the Army Institute of Pathology revealed that the most common diseases responsible for rapid, unexpected death among soldiers were heart disease, intracranial hemorrhage and meningococcemia. Of the many miscellaneous diseases also recorded, pneumonia occurred most frequently. In addition there was a group of deaths for which no cause could be established. The most common form of heart disease responsible for sudden death was severe coronary arteriosclerosis with or without demonstrable thrombosis. Rupture of an aneurysm of the circle of Willis was the most common cause of rapidly fatal intracranial hemorrhage. Degeneration of and hemorrhage into the adrenal cortex were regarded as important contributing causes of rapid collapse and early death incident to meningococcemia.

Tissue Reactions Induced by Fibrinogen Plastics.—According to Bailey and Ford several of the plasma proteins, notably fibrinogen, may be made into plastic materials. Studies were made to determine the tissue reactions elicited by a group of these plastics in the abdominal wall of guinea pigs. On the whole, the tissue reactions were relatively slight. The tissue reactions were affected by the nature of the substrate and of the plasticizer; they were much less affected by the concentration of the substrate and by the time of heating.

*Hodgkin's Disease in Infancy and Childhood: Report of Case. H. S. Wright Jr.—p. 586.

Influenzal Meningitis Treated with Streptomycin.—Hoyne and his associates report 3 cases of acute purulent meningitis due to Hemophilus influenzae type B in 2 boys aged 3 years and 13 months respectively and in 1 girl 9½ years old. The patients were treated successfully with combined Alexander's anti-influenzal type B rabbit serum, sulfonamide drugs and streptomycin. A standard recommended dose of 25 mg. of streptomycin was used intrathecally and 3 mg. per pound of body weight was injected intramuscularly every three hours. The largest total dosage of streptomycin used for any of the 3 patients was 75 mg. intrathecally and 5,700 mg. intramuscularly (total 5,775 mg.). The short duration of streptomycin therapy (ninety hours) and the infrequency of intrathecal streptomycin in these cases is in sharp contrast to the usual method reported in the literature. It is suggested that streptomycin may be of great value intramuscularly even when administered late in the course of the disease, at a time when intrathecal injection may not be required. Good results may be obtained without intrathecal therapy if adequate amounts of streptomycin are administered intramuscularly.

Water in Etiology of Poliomyelitis.—Scobey noted that the potential hydrocyanic acid content of plants that people commonly consume was increased during droughts when poliomyelitis is prevalent and that this poison is capable of producing symptoms and pathologic lesions such as those observed in this disease. While water is not technically classed as a food, it is an essential article of diet which also contains a relatively high percentage of hydrocyanic acid under the same conditions. Rain water, which may be considered a pure water, soon becomes surface water which quickly passes into the ground. The soil contains a high concentration of vegetable matter rich in cyanophore glucosides which may be hydrolysed in the soil to produce hydrocyanic acid or salts. A heavy rainfall during a long continued dry spell may actually carry vegetable matter made more potent by drought to the ground water and to wells, springs and larger bodies of water, there to be concentrated by natural evaporation. Organic matter growing in and on the banks of rivers and their tributaries also increases that which was received from the soil, near and far, through the ground water. Garbage may increase the organic content in some of the streams of the country. Fish and other forms of animal life probably furnish enzymes to hydrolyse the hydrocyanic acid-producing glucosides. The spread of poliomyelitis appears to follow waterways in many instances. It is suggested that the spring and fall overturns in bodies of water throughout the country would account, in part, for the appearance of poliomyelitis in the spring before vegetables and fruits have ripened adequately for human consumption and the high incidence of the disease in the fall when most of the harvest has been completed. It would also explain the sudden termination of epidemics of poliomyelitis with cold weather.

Hodgkin's Disease in Children.—Wright reports the occurrence of Hodgkin's disease in a boy aged 5 with large posterior auricular and cervical lymph nodes and a few discrete nodules varying in size on the right side of the neck, and with a more matted group, but not as prominent, on the left side. Nine months before admission there had been observed a small swelling behind the left ear attributed to tonsillar disturbance. Then came a severe attack of pertussis with constant progressive enlargement of the cervical glands. There was no history of loss of appetite or weight. The temperature during the child's six day stay at the hospital spiked to 101-102 F. daily. The blood count showed 4,270,000 red blood corpuscles and 7,800 white blood corpuscles, with 39 per cent mature and 8 per cent immature neutrophils and lymphocytes 53 per cent. Treatment consisted in intramuscular administration of 5 cc. of azosulfamide (prontosil) daily, intramuscular administration of 1 cc. of liver extract daily and oil bathing. Symptomatic therapy seems to be all that one has at present to combat the disease.

Pathology and Physiology of Struma Ovarii.—Smith reports a case of struma ovarii and analysis of 152 previously published reports. The tumor of a woman aged 58 consisted of thyroid tissue in various grades of differentiation, with malignant invasion of the blood vessels; several foci of osseous formation were observed. The iodine content of the tumor was 2.4 mg. per hundred grams of wet weight. There was evidence of a mild thyrotoxicosis which is attributed to the coexistence of a nodular goiter. Tumors of the ovary containing thyroid are of three general varieties: dermoids with thyroid, 50 per cent; cystoma with thyroid, 31 per cent, and pure thyroid, 17 per cent. Thyroid tissue has also been observed in association with chorionic carcinoma of the ovary and with a Brenner tumor. Coexisting tumors of the opposite ovary are not infrequent. Struma ovarii reproduces the architecture of the thyroid gland. Physiologic activity of these tumors is demonstrated by the presence of iodine in approximately half of the tumors investigated, by the presence of thyroid hormone as determined by the tadpole test, and in a few instances by clinical symptoms of thyrotoxicosis relieved by the removal of the tumor.

Surgical Treatment of Neoplastic Obstruction of Biliary Tract.—Stevens believes that the scope of surgical procedures applicable to the treatment of obstructive neoplasms of the extrahepatic biliary tract is limited. For all practical purposes individualization of treatment is confined to four methods: (1) local excision, (2) transduodenal resection of the ampulla of Vater, (3) a Whipple type of procedure and (4) palliative shunting of the bile flow. Four cases are reported which illustrate the indications for each of these procedures. Four modifications of the Whipple operation are submitted. Sparing a small portion of the tail of the pancreas has prevented postoperative diabetes, whereas total pancreatectomy has consistently been followed by diabetes. It is therefore important to leave some pancreatic tissue intact whenever practical.

Traumatic and Amputation Neuromas.—Cieslak and Stout review cases of traumatic neuromas from the records of the Presbyterian Hospital, New York. The commonest causes of neuromas of this type are either failure of the examining physician to recognize a nerve injury or a poor reparative procedure. In eighty-six amputations done at the Presbyterian Hospital only three neuromas occurred. The neuroma seems to be associated with infection or inclusion of the nerve in scar tissue. The best method of prevention seems to be ligation and section of the nerve as high as possible above the level of amputation, so that the nerve end is embedded in soft tissue and not in dense scar tissue.

Contact Lenses.—Case shows that the individual molding technic and the replacement of ordinary glass contact lenses by plastic contact lenses represent recent advancements. Contact lenses may be used not only to correct errors of refraction but also as a protective device for the eye against undesirable fluids, gases or solids; as such, they are becoming more and more popular for protection in industrial plants. These lenses are also useful as a mechanical aid in some corneal diseases. Contact lenses are used to keep penicillin solution in constant contact with the ulcer. In cases of keratoconus the vision of the eye is poor with an ordinary lens but is quite good with contact lenses. These lenses are a great help to actors, aviators, chemists, dancers, swimmers and divers, lecturers, microscopists, engineers, musicians, surgeons and athletes. At first the wearing time of contact lenses will be only an hour or two, but as the patient adjusts to the lenses four to five hours is the usual wearing time, after which the buffer solution usually needs to be changed.

*Sarcoidosis Simulating Glomerulonephritis. H. F. Klinefelter Jr. and S. M. Salley.—p. 333.
*Sulfonamide Sensitivity Determinations of Hemolytic Streptococci Isolated from Patients Before and After Treatment with Sulfadiazine. T. L. Hartman.—p. 342.
*Pathologic Findings in Fatal Case of Disseminated Granuloma Inguinale with Miliary Bone and Joint Involvement. J. Lyford III, R. W. Johnson Jr., S. Blackman and R. B. Scott.—p. 349.

Sarcoidosis Simulating Glomerulonephritis.—According to Klinefelter and Salley it is now recognized that sarcoidosis is a generalized granulomatous disease and that the skin lesions are only a minor and inconstant manifestation. Renal involvement accompanied by extensive retinal changes is so unusual in sarcoidosis that the authors report a case of this type in detail. Three other cases of sarcoidosis with renal insufficiency are reviewed and the findings in the 4 cases are tabulated. There is evidence that all were cases of generalized sarcoidosis. These 4 cases are quite similar, with relatively long benign course, minimal urinary findings with azotemia, anemia and usually normal blood pressure. The retention of nonprotein nitrogen with anemia seems out of proportion to the clinical evidence of renal disease. It seems probable that the renal insufficiency in sarcoidosis is the result of invasion of the kidneys by sarcoid granulomas. Extensive retinal changes occur in sarcoidosis, with or without renal involvement, and the retinitis does not result from the renal damage. While the diagnosis of sarcoidosis can be made with certainty only on finding the typical microscopic pathologic structure, the disease should be suspected when hyperglobulinemia and hypercalcemia are found in the presence of azotemia. Multiple myeloma is the only other disease which may cause this unusual blood chemical abnormality.

Sulfonamide Sensitivity of Streptococci After Treatment with Sulfadiazine.—Hemolytic streptococci isolated from the nasopharynx of 40 patients before and after sulfadiazine therapy were tested by Hartman for resistance to the action of sulfadiazine. None of the hemolytic streptococci isolated following a course of sulfadiazine therapy showed evidence of the development of resistance to sulfadiazine.

Disseminated Venereal Granuloma.—A young Negro woman died ten months after the appearance of the original genital lesion and eight months after the onset of the systemic manifestations. Donovan bodies were grown in continuous tissue cultures of material taken by biopsy from affected bones and joints, as well as being demonstrated in the tissues on microscopic examination. The necropsy, described by Lyford and his associates, further demonstrated that granuloma inguinale is a general systemic disease which involves the bones, joints, soft tissues and internal organs and can terminate fatally.

Fatal Case of Acute Porphyria.—A corporal aged 22, who came under the observation of Abbott and Evans in the South Pacific Area, complained of pains and cramps in the abdomen, mostly involving the right upper quadrant. He gave a history of previous attacks of abdominal pain with remissions and exacerbations. He had paralysis of the muscles of the upper extremity and paresis of the lower extremity, and there was respiratory embarrassment. Porphyrins were demonstrated in the urine. Death followed a series of generalized convulsions. Microscopic studies revealed a tendency to patchy degeneration of the myelinated fibers of the nerve roots and of the white matter of the spinal cord, a more selective degeneration of the central white fibers which pass through the gray matter, the occurrence of petechial hemorrhages and areas of focal necrosis in the pons, and an advanced degree of chromatolysis in cells of the dentate nucleus as well as cerebellar and cerebral cortex. Toxic changes were found in the liver and spleen. The authors suggest that treatment should be directed toward protecting the liver against the toxic factor causing this damage.

Coccidioidal Brain Abscess.—Rhoden describes what he regards as the first case of coccidioidal brain abscess to be reported in the literature. The abscess had almost replaced the tissues of the left cerebellar hemisphere and caused compression of the fourth ventricle and terminal meningitis. The clinical course was insidious and asymptomatic up to the final stage, when mounting intracranial pressure and meningitis became manifest. The lesion occurred in a 16 year old white boy who had lived in the endemic area for about three years and had severe diabetes mellitus.

Control of Menorrhagia.—The studies reported by Greenblatt and Kupperman extended over several years and represent an analysis of cases of functional uterine bleeding treated by various methods utilizing steroid hormones. They found that the administration of 25 mg. of testosterone propionate and 10 mg. of progesterone daily during a four to five day period results in a rapid cessation of bleeding, which after an interval of four or five days is followed by a short bout of withdrawal bleeding. This method of therapy has thus far proved the most promising in the management of menorrhagia.

Pheochromocytoma of Adrenal Medulla in Pathogenesis of Malignant Hypertension.—In the case of pheochromocytoma of the adrenal medulla presented by Washington and his associates the onset was typical, consisting of attacks of vomiting, headache, flushing of the face, blurring of vision and paroxysmal hypertension. The hypertension subsequently became permanent. The patient, a man aged 26, died shortly after attempted removal of the tumor without clinical evidence of uremia. Unusual features were a widespread necrosis of the arterioles and associated hemorrhages without evidence of uremia, and malignant transformation in the tumor characterized by invasion of the right adrenal vein and of the inferior vena cava. An epinephrine-like substance was demonstrated in the tumor. It is assumed that the prolonged discharge of vasopressor substance from the tumor may produce changes in the arterioles which result in permanent hypertension. The continued release of this substance after the development of a permanent elevation of the blood pressure may be responsible for the production of arteriolar necrosis and hemorrhages without the presence of uremia.

Cellular Recovery After Penicillin Treatment.—Moore studied tissues of patients who were treated with penicillin and who subsequently died of the primary disease or of a complication. A comparison was made of the lesions of the heart in subacute bacterial endocarditis in 22 patients treated with penicillin and in 8 patients not given specific therapy. Penicillin promotes healing in subacute bacterial endocarditis, but the basic processes of healing are not modified. These processes are covering of the exposed surface of the vegetation with fibrous tissue, invasion of the layer of colonies and phagocytosis of bacteria, calcification of bacterial colonies, hyalination and calcification of the central core of the vegetation, and endothelization of the spaces and clefts in the vegetation. Healing in some patients is accompanied with excessive calcification, and the result is a calcific stenosis of the valve. The vegetative lesions of subacute bacterial endocarditis consist of two parts, a nonbacterial (rheumatic or thrombotic) primary part and a bacterial secondary part.

Conjugated Forms of Folic Acid in Tropical Sprue.—According to Suárez and his associates folic acid (pteroylglutamic acid) occurs naturally not only as a free vitamin but also in the form of various complexes or conjugates. Two of these complexes, both polyglutamates, have been isolated in pure form, one from yeast and one from a filtrate obtained from an aerobic fermentation of a diphtheroid type organism. The folic acid complex of yeast, often termed vitamin B_c conjugate, was identified as pteroylhexaglutamylglutamic acid. The other naturally occurring complex, which is usually termed fermentation folic acid or fermentation Lactobacillus casei factor, was shown to be a triglutamate (pteroyldiglutamylglutamic acid). Following the parenteral administration of fermentation folic acid in a dose equivalent to 3.1 mg. of pteroylglutamic acid daily, the clinical and hematologic manifestations of sprue were improved in a patient previously treated with liver extracts. Administration of the conjugate caused the elimination in the urine of free folic acid in an amount indicating that a large proportion of the conjugate was converted in vivo to the free vitamin, although the amounts excreted during the first three days of therapy suggested that greater retention occurred when the need was greatest. When purified liver extract free of folic acid was administered in addition to fermentation folic acid a remarkable increase in the urinary excretion of free folic acid occurred, a circumstance which suggests that the erythrocyte maturation factor may be concerned with the release of stored complexes of folic acid or that in some other manner it affects the metabolism of folic acid. Oral administration of a concentrate of vitamin B_c conjugate of yeast in daily doses equivalent to 8.4 mg. of free pteroylglutamic (folic) acid caused rapid clinical improvement in a patient with sprue given no previous treatment with liver extracts, yeast or vitamins. Urinary studies showed at first only small augmentations in the excretion of the free vitamin, although the amount gradually increased. Whether the small amounts excreted are indicative of utilization of the conjugate as such or whether they suggest an unusually strong retention of free folic acid released from the conjugate cannot be determined at present. Poor absorption is unlikely in view of the prompt and striking clinical and hematologic improvement. Following the administration of purified liver extract (free of folic acid) in addition to the conjugated vitamin the daily urinary elimination of folic acid was increased. This suggests that augmentation of the urinary elimination of free folic acid resulted from an effect of a component of purified extracts of liver on the metabolism of this naturally occurring complex of folic acid or on tissue complexes stored as a result of treatment with the conjugate.

Electroencephalographic Observations in Head Injuries.—Laufer and Perkins give the electroencephalographic findings in 209 cases of head injury treated at an army neurologic-neurosurgical center. Electroencephalographic abnormalities are apparently indicative of brain injury. The percentage of electroencephalographic abnormality increases with the severity of injury. It is greatest when the dura has been penetrated. The percentage of electroencephalographic abnormality decreases as time elapses from injury. Amplitude asymmetry is a guide to the site of injury and an index of electroencephalographic improvement. Focal records were not found in mild injuries but did occur with severe injury and penetrating wounds. Focal records without convulsions were found almost entirely when the injury had been received less than six months before the initial electroencephalogram. Focal records with convulsions occurred longer than six months after injury. This suggests the possibility that posttraumatic epilepsy, though initially asymptomatic, may eventually develop in cases with focal records.

Methedrine in Psychiatric Diagnosis.—Simon and Taube found that all patients became more talkative when 15 to 20 mg. of methedrine was administered intravenously. Some disclosed previously unobtainable material. In several cases emotional outbursts occurred. In 1 instance paranoid delusions were released. It is suggested that methedrine may have a place in the armamentarium of psychiatric diagnostic methods.

Grammar-Rhetoric Indicator.—The Mayerses show that their "dynamic concept test" affords an opportunity for "grammar-rhetoric indicator" analysis. Their dynamic concept test is a standardized form of play technic in which five stories are asked for: (1) a story about a child of 5 or under, (2) a story about an ideal family, (3) a story about best friends, (4) a romantic story and (5) a story about a hero. The topics of the stories were chosen because of their conflict content. The authors show that the overuse of moods, such as the conditional and interrogative and subjunctive, has a special meaning, as has also the constant use of verbs such as "should," "ought" and "must" and the absence of active verbs. Such findings as the omission of articles and pronouns and the superabundance or scarcity of adjectives have been similarly analyzed. The grammar-rhetoric indicator findings have proved of definite aid in both the understanding and the diagnosis of mental patients.

*Tires as Factor in Transportation of Mosquitoes by Ships. J. J. Pratt Jr., R. H. Heterick, J. B. Harrison and L. Haber.—p. 785.

Atomic Energy and Health.—Lyon presents some psychologic problems associated with the atomic bomb. Through facts learned in Operation Crossroads we are now in a position to evaluate more accurately the effects of an atomic explosion. Not only have we been able to study the phenomena of the explosion and to observe their effects on target vessels but we have had actual experience in coping with the dangers which remain after the bomb has exploded.

1945 Influenza B Epidemic in Pacific Area.—Milstone and his associates studied the 1945 epidemic of influenza on the island of Oahu and traced it westward across the Pacific to Okinawa. The epidemic was typical in its epidemiologic, clinical and laboratory aspects. Rapid presumptive identification of the disease was accomplished by comparing the serum titers in a group of acute cases with the titers in a group of convalescent cases. The diagnosis was confirmed by individual serologic tests and by the isolation of influenza B virus. A study was made of the antibody response shown by a group of soldiers who were injected with a standard influenza vaccine. A greater response was observed to the Lee strain of influenza B than to the PR8 strain of influenza A. The flora of the upper respiratory tract of patients varied from that of an uninfected control group principally in showing a threefold increase in incidence of beta hemolytic streptococci.

Transportation of Mosquitoes by Ships.—Pratt and his co-workers say that during the routine Public Health Service quarantine inspection at Los Angeles of a cargo ship from the New Guinea area several live adult mosquitoes were observed in one of the holds of the ship. An investigation revealed that mosquitoes were breeding heavily in fresh water contained in motor vehicle and aircraft tires, which constituted a large part of the cargo. It was estimated that approximately half of the 8,880 tires aboard contained water and that a large proportion of these contained living mosquito larvae. All openings leading into the holds were closed and each hold was thoroughly sprayed with freon-pyrethrum aerosol. Many dead adult mosquitoes were recovered from the holds after the spraying. According to the method instituted of treating tires containing larvae a disinfestation squad was stationed on the dock warehouse loading platform with knapsack sprayers containing 5 per cent DDT in kerosene. As the tires were unloaded onto the platform and rolled into freight cars of box type they were quickly inspected for the presence of water and those found to contain water were sprayed with the DDT. Strict precautions should be taken to prevent the transportation of exotic mosquito species into this country in a viable condition.

Hemorrhage from Peptic Ulcer.—Heuer reviews observations on 337 patients admitted to the hospital because of massive hemorrhage due to peptic ulcer. Twenty-seven died from hemorrhage, 18 of them without operation and 9 following operation performed on 31 patients during bleeding. In the fatal type of hemorrhage the location of the ulcer, if duodenal, is on the posterior duodenal wall and, if gastric, on the lesser curvature. The blood vessels causing the hemorrhage are the pancreaticoduodenal and the right and left gastric arteries or their major branches. To differentiate patients with fatal and nonfatal types of hemorrhage the most consistent criteria are failure to improve promptly under a strict regimen of bed rest, moderate doses of morphine, withholding fluids and food by mouth and adequate blood transfusions and the recurrence of hemorrhage while the patient is on a strict regimen. If operation is decided on it should be done within twenty-four or forty-eight hours of the onset of hemorrhage. Local ligation of the vessels has not permanently controlled hemorrhage. Local excision of the bleeding ulcer and gastric resection, including removal of the ulcer, have given the best results. In patients who recover from hemorrhage on a strict medical regimen the question of recommending surgery or of continuing a medical regimen is vital.

Ependymoma of Filum Terminale.—p. 831.
Cystadenocarcinoma of Left Ovary.—p. 833.

Infective Hepatitis.—Moloney discusses two acute types of hepatitis: epidemic (and sporadic) hepatitis, transmitted in all probability by the intestinal-oral route, and serum hepatitis, transferred parenterally. Although these forms of hepatitis are alike pathologically and clinically, certain differences exist. Since the infective agent has not been isolated, it is not clear whether the disorders are caused by the same or by different etiologic agents. There is no specific therapy for infective hepatitis, but adequate bed rest and proper diet are effective. Acute infective hepatitis is becoming more prevalent in civilian practice. It is probably an antecedent factor in chronic liver damage and cirrhosis more frequently than it is realized. In old and debilitated patients the disease may be fatal.

*Effects of Combined Ambulatory Insulin and Electroshock Therapy in Treatment of Schizophrenia: Preliminary Report. P. Polatin and H. Spotnitz.—p. 2648.

Endocrine Factors in Female Sterility.—Rubin thinks that under the influence of exaggerated claims made for hormonal extracts in sterility these substances are employed to the neglect of other essential therapeutic measures. Two endocrine products have therapeutic influence in sterility—thyroid and estrogens; thyroid for its trophic influence on the ovaries and general metabolism, and estrogens for their activating effect on the oviducts and possibly also on the cervical secretion. In suppressed menstruation and anovular menstruation an effective endocrine substance is not yet available. Fractional x-ray irradiation of the ovaries in many instances leads to normal menstrual cycles and increases the possibility of impregnation. Conservative surgery such as resecting the microfollicle cystic-bearing portions of the ovaries has brought about regulation of the menstrual cycle in puberty bleeding and in functional menometrorrhagia of young women. This procedure is also capable of restoring menstruation which is habitually delayed.

Diagnosis of Postconcussional State.—Beck hopes that the material he presents will help clarify the confused picture of the postconcussional reaction and differentiate between traumatic cerebral dysfunction and pure anxiety. One hundred and seventy-two patients who experienced either a blast or a head injury were analyzed and compared with 50 patients with a nontraumatic anxiety. The characteristic symptoms in the postconcussional patients in the order of frequency were headache, unconsciousness, insecurity feeling, emotionalism, vertigo, difficulty in thinking, difficulty in letter writing and anomia. The most prominent diagnostic physical defects were in relation to the eyes. These consisted of convergence defect, nystagmus, disturbed upward gaze, external ocular muscle imbalance and inequality of pupils. Eighty-four per cent of the postconcussional patients had at least one of these eye signs. Real vertigo was frequent in the patient with a postconcussional reaction; it did not occur in the nonorganic control group. Word recall was the only test of the mental status, the results of which indicated a postconcussional reaction. Some of the previously forgotten events related to the injury were recalled by the postconcussional patients after sodium amytal narcosis.

Combined Insulin and Electroshock Therapy in Schizophrenia.—Polatin and Spotnitz gave electroshock three times weekly and ambulatory insulin six times weekly. On three days during the week the patients received ambulatory insulin in the early morning and later that morning an electroconvulsion. The electroshock treatment was continued for about seven weeks until the patient had received twenty convulsions, and the ambulatory insulin was continued for eleven weeks. Of 30 schizophrenic women treated in this way 23 were improved, 18 of them so considerably that they were restored to approximately their prepsychotic level of functioning. Seven patients remained unimproved. The effectiveness of the therapy did not appear to be limited by the duration of the psychosis, the prepsychotic personality or the type of schizophrenia.

Radioactive Iodine Therapy in Hyperthyroidism.—The present paper by Hertz and Roberts is a three to five year follow-up report on early experiences with "internal irradiation" in the treatment of 29 cases of hyperthyroidism. Analysis of both failures and successes reveals that radioactive iodine when given in the dosage range of 5 to 25 millicuries to uniodinized patients with hyperthyroidism possessing goiters of 60 to 75 Gm. is highly effective in about 80 per cent of cases. When appreciable activity has been administered and subtotal thyroidectomy is resorted to, myxedema or hypometabolism may be expected to develop in a large fraction of the cases (100 per cent in 5 cases in this series).

Dermatosis Due to Quinacrine Hydrochloride.—Peterkin and Hair detected 26 instances of exfoliative dermatitis due to quinacrine hydrochloride (Atabrine) among British and Canadian troops in Italy. Primary lesions often appeared as dry hyperkeratosis of the palms and soles with cracking or as small deep purplish nodules, usually on the feet and hands. These were soon followed by a rash on the trunk and limbs, which tended to run along the lines of cleavage of the skin in the form of erythematosquamous patches not unlike pityriasis rosea. With these there also appeared indurated plaques more or less oval and varying from the size of a pinhead to the size of a walnut. These were dark violet and ill defined and left an intense pigmentation. These plaques had sites of predilection round the neck like a necklace, round the costal margin, on the inner surface of the thighs and on the feet, ankles, hands and forearms. Some patients had crusted impetiginous lesions of the chin, ears, eyebrows and flexures. In many, phrynoderma was evident, the skin having a nutmeg grater feel and looking not unlike pityriasis rubra pilaris. Several men had patches closely resembling lupus erythematosus. Oral lesions tended to appear about the same time as the generalized eruption and were of three types: bullae or ulcers and cheilitis, lesions indistinguishable from lichen planus. Administration of quinacrine to 3 patients whose skin lesions had practically disappeared caused an exacerbation of the eruption. The authors do not regard these skin complications as contraindications to the use of quinacrine since any drug is liable to produce toxic effects in a certain number of persons.

Penicillin for Breast Abscess.—Florey and her associates compare the results obtained with penicillin in breast abscesses with those obtained with the methods used when penicillin is not employed. The cases number 36 and were chosen for the control or penicillin series in strictly alternate chronologic order. There were 22 abscesses in the 18 control cases and 24 in the 18 penicillin treated cases. The average healing time in penicillin treated cases was reduced to half that in controls. Suppuration was hastened but ceased more rapidly. The use of diethylstilbestrol was not necessary and the mothers were able to continue suckling throughout treatment. The number of operations was reduced from 22 to 4. The total number of days during which treatment at the hospital was required was reduced from 661 to 232. Penicillin treatment consists in the preliminary use of intramuscular injections followed by local administration.

Inhibition of Staphylococci by Inactivated Penicillin.—Hunwicke says that at his laboratory penicillinase prepared by the growth of certain strains of Bacillus subtilis in broth has been used to inactivate penicillin before testing for sterility. A 1:20 dilution of the penicillinase preparation in water is added in ascending quantities to a series of broth tubes each containing 4,000 units of penicillin. These are inoculated with a loopful of broth culture of a sensitive staphylococcus, and the end point is read after forty hours' incubation at 37 C. On one occasion 20,000 units of penicillin was erroneously added to each tube in setting up the assay. On this being realized, the penicillinase was diluted 1:4 instead of 1:20, the assumption being that this would give the same result. However, no growth of staphylococcus occurred in the tubes. The assay was then repeated at the normal level of dilution and an end point was obtained as usual near the middle of the range. This incident suggested that the ability of staphylococci to grow in broth plus inactivated penicillin is limited to a certain range of concentration of penicillin. The author describes experiments that were carried out in order to throw light on this ambiguous inhibition. He concludes that staphylococci are inhibited by penicillin above a certain concentration, notwithstanding that the penicillin is shown to have been inactivated by penicillinase. This does not occur with "pure" penicillin, suggesting that the inhibition is due to impurities. Similar inhibition occurs in penicillin dilutions in broth below a certain concentration. In this instance the inhibition is due to the penicillinase having failed to inactivate. In both instances, if the penicillin in broth is rendered capable of supporting growth by diluting the high concentrations or by adding excess penicillinase to low concentrations, growth of staphylococci occurs with extraordinary rapidity. The implications of the observations are discussed from the point of view of sterility testing of penicillin.

Residential Rest During Antenatal Period. G. M. Allen-Williams and I. Sutherland.—p. 278.
Full Time Secondary Abdominal Pregnancy with Delivery of Living Child. H. S. Waters.—p. 285.

Acute Inversion of Uterus.—Spain reports 2 personally observed cases of acute inversion of uterus. In both the inversion was complete without prolapse. In both "cupping" of the uterus was not noted by abdominal palpation although the patients were thin. In the first case the absence of the two signs mentioned prompted delay in vaginal examination and reduction. This delay may have been responsible for the death of the patient. In the second case vaginal examination was made at once although both signs were absent, and immediate reduction was carried out. Immediate reduction is the most important part of the treatment of the shock resulting from this accident.

Diabetes Insipidus with Postpartum Pituitary Necrosis.—According to Spain and Geoghegan it has been established that postpartum ischemic necrosis of the anterior pituitary is a relatively frequent complication in cases in which delivery is attended with a severe degree of collapse. The striking clinical feature of the 2 cases reported by them was the occurrence of an extreme degree of polyuria and the finding at necropsy of necrosis in both the anterior and posterior lobes of the pituitary body. The occurrence of symptoms of diabetes insipidus in association with postpartum necrosis of the pituitary has not previously been commented on. Profound shock occurred at the time of delivery in both cases. In the first case this was associated with acute inversion of the uterus and in the second case with combined accidental hemorrhage occurring in unusually unfavorable circumstances.

Hemoglobin Values in Female Workers.—Davies and his associates made investigations on 2,000 women at an ordnance factory. One group, numbering 1,000, were women living at home; the other 1,000 were residents at a hostel near the factory, freed from the difficulties of traveling and of domestic responsibility. It was found that in spite of wartime restrictions the incidence of anemia was no greater than in times of peace. The married women (especially those with large families) show a higher incidence of anemia. Only 5 per cent of the 2,000 women showed hemoglobin below 11 Gm., while almost 70 per cent were above 13 Gm. The young women fed and housed in hostels showed the best hemoglobin values. The married women showed a less satisfactory state, and anemia was almost twice as frequent in this group.

Colchicine Ineffective in Inducing Polyploidy in Penicillin Notatum. E. R. Sansome and L. Bannan.—p. 828.

Benign Lymphocytic Meningitis and Glandular Fever.—According to Tidy the clinical symptoms, course and prognosis of benign lymphocytic meningitis and of the neurologic manifestations of glandular fever are indistinguishable. The changes in the cerebrospinal fluid are identical in the two conditions. In glandular fever with neurologic manifestations the glandular enlargement is usually slight. This feature, together with mononucleosis and heterophil agglutinins, may develop only after the neurologic symptoms have subsided or may precede the nervous stage. With the presence of such neurologic symptoms, glandular fever can be excluded only by specific and repeated examinations. Such examinations do not appear to have been performed in cases recorded as benign lymphocytic meningitis, and the possibility of glandular fever as a causal factor has consequently not been excluded.

Fluorine Hazards, with Special Reference to Industrial Processes.—Murray and Wilson point out that an outbreak of fluorosis in cattle has drawn attention to the large amount of fluorine and fluorine compounds being set free by some industrial processes. Naturally occurring or endemic fluorosis attributable to water supplies, and "man-made" fluorosis due to industrial processes should be separately considered, though some of their effects may be the same. Fluorine should be extracted from fumes before allowing them to pass into the atmosphere. In an example mentioned the substitution of closed kilns in the burning of ironstone would make the amount of fluorine present in the ore and coal immaterial from the public health point of view, but methods for such fluorine control are at present too rarely applied, because fluorine hazards are not sufficiently appreciated.

Myelitis After Antirabic Vaccine.—Bussell reports the case of a Sudanese soldier aged 25 who was bitten on hand and ankle by a stray dog. Treatment with antirabic vaccine was begun immediately, but after seven daily injections the patient defaulted. He returned about 7 weeks later saying that the dog was mad and the daily injections were resumed until 13 more had been given. Four days after the last injection be became ill and died four days later. At different stages of the illness diagnoses of meningitis, acute anterior poliomyelitis, and rabies were considered. These possibilities were discarded in turn, and a diagnosis was made of myelitis due to antirabic vaccine, terminating in a bulbar palsy. Paralyses from this cause are not uncommonly reported, but in most cases recovery is the rule. Either a virus or a toxin is held responsible for this complication. The lack of inclusion bodies in the patient's brain or spinal cord and the negative result of the rabbit inoculations might be held against a virus but do not exclude it. No other accidents have been reported following the use of this batch of vaccine, and laboratory investigation for toxicity proved negative. It appears therefore that the patient was abnormally sensitive to some chemical ingredient of the vaccine.

Medical Journal of Australia, Sydney

*Analysis of Peptic Ulcer in South Australia, Based on Study of 1,027 Case Reports. H. W. Linn.—p. 649.
Surgery in Two World Wars. C. W. B. Littlejohn.—p. 659.
*Chemical Nature of Allergens: Observations on "Protein Free" Preparations of Egg White, Linseed and Castor Bean. Patricia Rhoden and C. Sutherland.—p. 662.
Hormones in Gynecology. W. I. Hayes.—p. 663.
Epidemiology of North Queensland Tick Typhus: Natural Mammalian Hosts. F. Fenner.—p. 666.

Peptic Ulcer in South Australia.—Linn reviewed 1,027 cases seen at the Royal Adelaide Hospital between 1939 and 1944 in which there was reliable evidence of peptic ulcer. Duodenal ulcer was found to occur in younger people oftener than gastric ulcer, while the proportion of males to females in both gastric ulcer and duodenal ulcer was seven to one. This figure is high but not nearly so astonishing as the proportions for ruptured gastric ulcer (19 to 1) and for ruptured duodenal ulcer (28 to 1). The question why male patients exceed female patients in cases of chronic peptic ulcer, and especially in cases of ruptured ulcer, has not yet been answered. The fact that the incidence of gastric and duodenal ulcer differs has been cited by some as indicative of a separate etiology, but the author rejects this, pointing out that experimentally gastric and duodenal ulcer have been produced under the same conditions. The variation in incidence and rupture rate may be due to a combination of varying anatomic and physiologic factors, with differing external and predisposing causes. One of these predisposing causes was believed to be the continued consumption of alcoholic liquor. In this survey only 50 per cent of ulcer sufferers drank alcohol at all. This would appear to rule this factor out as a major consideration in the etiology of peptic ulcer, although it is undeniably the cause of some recurrences of symptoms. Smoking likewise is probably not a primary factor but may be an added irritant. It is noteworthy that ruptured gastric ulcer is twice as common as ruptured duodenal ulcer in South Australia, while the reverse is the case elsewhere. The author can offer no explanation of this fact.

Chemical Nature of Allergens.—Rhoden and Sutherland say that until recently most authorities have held that all allergens are protein in nature. In 1942 one of the authors, in seeking to isolate the allergen of house dust, obtained a remarkably active substance from an aqueous extract of house dust by adsorption on benzoic acid, and this was found to give no qualitative reactions for protein. This suggested that it would be of interest deliberately to remove all proteins from extracts of allergens and to see whether the residues showed allergic activity. The authors found that egg white, castor bean and linseed after treatment with several of the classic protein precipitants retain their power to produce skin reactions on hypersensitive subjects. Certain proteins however, such as ovomucoid, are not precipitated by many of the usual protein precipitants. The difficulty of complete separation of mixtures of complex organic compounds is emphasized.

*Glycogen Disease. T. Crawford.—p. 285.
*Etiology of Chloroma and Nature of Green Pigment: Report of 3 Cases. J. G. Humble.—p. 299.

Glycogen Disease.—Crawford reports a further 3 cases of von Gierke's disease in which detailed study was made of some aspects of carbohydrate metabolism. The occurrence of an impaired tolerance to intravenous dextrose, an investigation only once previously reported in glycogen disease, is confirmed. From a survey of the available evidence it appears that in this disease the reversible reaction by which dextrose is converted into glycogen and glycogen to dextrose is at fault. This leads to a greater or less degree of carbohydrate starvation of the tissues, with consequent increased metabolism of fat and the production of ketones.

Etiology of Chloroma and Nature of Green Pigment.—Humble stresses the rarity of chloroma and the fact that it is hardly ever diagnosed during life. He reports 3 instances of the disease. In the first patient chloroma complicated chronic myeloid leukemia during treatment with x-rays. The second patient had acute myeloid leukemia which terminated as chloroma. In the third patient chloroma complicated monocytic leukemia. The author suggests that the green pigment resembles choleglobin derivatives and gives reasons for attributing the formation of the green pigment to abnormal breakdown products of hemoglobin.

*Treatment of Asthma with Intravenous Administration of Procaine Hydrochloride. H. Durieu, F. De Clercq and A. Duprez.—p. 150.

Acetylcholine in Paroxysmal Tachycardia.—Segers and his associates were able to arrest 81 attacks of paroxysmal tachycardia by the intravenous injection of acetylcholine. The injection must be made as rapidly as possible while the subject is in dorsal decubitus. The first dose consists of 0.02 Gm. If this proves insufficient, larger doses are injected every three or four minutes. The general reactions observed after these injections do not involve danger because acetylcholine is rapidly destroyed in the organism.

Intravenous Procaine Hydrochloride for Asthma.—Durieu and his associates used daily intravenous injections of from 5 to 20 cc. of a 1 per cent solution of procaine hydrochloride without epinephrine on 25 asthmatic patients. In asthma patients with typical attacks but who have neither emphysema nor chronic asthma, lasting improvement is obtained in half of the cases and temporary improvement in another 30 per cent. Of patients in whom asthma is accompanied with emphysema and bronchitis only 30 per cent show temporary improvement and in the dyspnea of pulmonary sclerosis the treatment is useless. Preliminary oral administration of phenobarbital seems to improve the tolerance for procaine hydrochloride. Neither the allergic state nor the neurovegetative disturbance is influenced by the procaine hydrochloride.

Diets for Infant Diarrheas.—Rohmer and his associates used a diet of concoctions of powdered St. John's bread (50 Gm. of powder in 1 liter of water) or of soup of carrots (500 Gm. of carrots cut into small pieces and boiled in 500 Gm. of water for two to three hours) in the treatment of mild and severe noninfectious or infectious dyspepsia in 76 infants between the ages of 8 days and 11 months and in the treatment of enteritis in 21 infants. Hydrating solutions were administered for fifteen to eighteen hours in cases of severe dyspepsia and for twenty-four hours in cases of mild dyspepsia; feeding was then resumed with one of the two diets, thus preventing starvation, and the formula was slowly increased to full strength within eight days. This period was shortened to six days in 7 cases of infectious dyspepsia and to four to seven days in 8 cases of noninfectious dyspepsia. Either one of the diets was effective, since feces changed their form rapidly within two to three days. A less rapid improvement suggests the existence or persistence of an infectious cause which should accordingly be treated.

Treatment of Loss of Substance of Peripheral Nerves. M. d'Aubigné.—p. 292.
Repair of Wounds with Traumatic Loss of Substance of Nerve Trunks of Extremities: Anatomicoclinical Study. L. Dejardin.—p. 306.

Preservation of Sphincter Function.—D'Allaines and de Vernejoul performed abdominosacral excision of a considerable portion of the rectum with preservation of the mucosa of the anal canal in 57 patients with cancer of the rectum. The patients were between the ages of 35 and 73. Continence with respect to liquid stools and gas resulted in 38 patients, less good results with incomplete continence for liquid stools were obtained in 15 patients and there were unsatisfactory results in 4 patients. In contrast to the majority of the French surgeons, the authors believe that conservative surgical treatment based on anatomicopathologic principles is justified in a large number of cases of cancer of the rectum, since control examinations six months to ten years after the intervention revealed that the incidence of recurrences and of metastases in these cases was not higher than in those in which mutilating amputation of the rectum had been performed.

*Blood Transfusions in Treatment of Hemoglobinuric (Blackwater) Fever. J. Julliard and L. J. Escalle.—p. 678.
Skin Transplantation to Cure Eventration. R. Dantlo.—p. 680.

Danger of Cadmium Lined Food Containers.—Monnet and Sabon report that 300 persons developed food poisoning after eating in a worker's canteen. The poisoning was caused by wine which had been kept for several hours in cadmium lined containers. The wine was found to contain from 100 to 180 mg. of cadmium per liter. After citing reports on many similar cases of poisoning caused by drinks or foods that had been kept in cadmium lined containers, the authors point out that from fifteen to ninety minutes after ingestion of such drinks or foods there appear signs of gastrointestinal intoxication with dryness of the mouth and throat, nausea, epigastric pains, gastric cramps, vomiting and severe diarrhea. The patients usually recover in less than a day or two, because the decided emetic effect of cadmium causes rapid elimination. It should be called to the attention of industrialists, hygienists and physicians that cadmium lined containers should not be used in the handling of foods and drinks.

Blood Transfusion for Hemoglobinuric Fevers.—Julliard and Escalle present the histories of 5 malarial patients who developed blackwater fever. The hemoglobinuria was accompanied with splenomegaly, rapid pulse, sweats, chills, vomiting and erythrocyte counts of only about one million. The patients were given blood transfusions from universal donors and have recovered. Concurrently with the blood transfusions the patients were given quinine intramuscularly, quinacrine subcutaneously, a cardiac stimulant, a diuretic and rehydrating treatments. The result was that on about the third day the patients usually were convalescent. From 150 to 250 cc. was injected at each transfusion, and the total never exceeded 700 Gm. The authors conclude that blood transfusion is a powerful weapon in the treatment of blackwater fever, because of 22 patients with hemoglobinuric fever who were treated with the ordinary methods and were not given transfusions, 7 died.

Chronic Myocarditis as Independent Disease Entity. R. Jaffé.—p. 402.

Electrocardiographic Changes Due to Inanition.—*Observations on 50 patients* who had been starved in concentration camps revealed that circulatory changes are almost a constant symptom of severe inanition. Reduction in the height of the T wave was regularly observed, and somewhat less frequently the amplitude was abnormally small. In cases in which inanition was complicated by infectious diseases or by preexisting heart disease, complicated electrocardiographic changes were evident. Hunger edema and reversible diffuse impairment of the myocardium frequently play a part in the development of these changes. Pathologic studies reveal regressive changes, chiefly fatty degeneration. The myocardial metabolism becomes impaired by disturbances in the ferment system and by deficiency in vitamin B_1.

Electrocardiographic and Spirometric Investigations in Besnier-Boeck-Schaumann's Disease.—According to Leitner impairment of the cardiac and pulmonary functions is relatively frequent in Boeck's disease. It may be primary because the heart is attacked by the disease, or secondary because of overburdening of the right side of the heart in the presence of long duration of pulmonary lesions and inadequate arterialization. The author found that 8 of 17 patients with Boeck's disease had electrocardiographic evidence of myocardial lesions; 1 patient had a patent ductus arteriosus. The electrocardiographic changes were intensified by physical work in 7 out of 8 patients. Oxygen inspiration abolished the electrocardiographic changes in 2 cases. Spirometry often revealed pulmonary disturbances.

Incidence of Ulcuscarcinoma of Stomach. B. J. Koszewski.—p. 210.
Problems of Allergy; Histidine Treatment of Diseases Caused by Allergy. P. Kallós.—p. 233.

Argentaffin Cells in Pancreatic Islet Cell Tumors.—Hultquist reports a microscopic study of 3 tumors of the islands of Langerhans in men between the ages of 17 and 43. The extirpated tumors were morphologically of common type and presented no signs of malignancy. When stained with silver solutions the tumor tissue and especially the nuclei presented a diffuse, strongly brown color in contrast to the rather pale island tissue and to the parenchyma surrounding the tumor. *In 2 cases argentaffin cells were demonstrated in the pancreatic* tissue adjacent to the tumor and in the tumor itself where they were situated at the edges of the heaps of tumor cells corresponding to the common localization of argentaffin cells. Spool and star shaped cells with long, narrow branches showed silver impregnated fibrils. These cells may be considered as reticular or satellite cells, forming a network in some places in the tumor parenchyma. The island tissue of the surrounding pancreatic parenchyma showed a considerable increase in argentaffin cells. This may be considered as a manifestation of the reduced activity of the islands and probably depends on the fact that a major part of the production of insulin has been assumed by the island tumor.

*Conservative Surgery in Tubal Pregnancy. J. C. Graham F.—p. 221.
Fulminant Pelvic Edema: Case. M. Madrazo B.—p. 247.

Conservative Surgery in Tubal Pregnancy.—Graham F. advises preservation of the oviducts in all cases of tubal pregnancy except in cases of acute infection, when salpingectomy is indicated. The management of the oviducts in tubal pregnancy depends on whether or not the tube is normal or ruptured. *If it is normal, treatment consists in simple salpingotomy*, emptying of the contents and reconstruction of the tube. If the tube is ruptured without great destruction, the ruptured segment is sutured. If the rupture results in destruction of the tube, the tube is amputated up to the ampullar segment and a new abdominal os is reconstructed. The percentage of patients who obtain normal intrauterine pregnancies with delivery of normal infants is satisfactory. Three cases with living infants at full term after conservative surgical treatment of tubal pregnancy are reported.

*Value of Melanophore Reaction in Diagnosis of Pregnancy. J. E. de Bourgraaf and E. Dingemanse.—p. 1430.
Sulfonamide Preparations. A. de Groot.—p. 1433.
Modified Hematologic Standard Values as Result of Deficient Diet. S. I. de Vries.—p. 1434.

Melanophore Reaction in Diagnosis of Pregnancy.—De Bourgraaf and Dingemanse direct attention to the pregnancy test described by Konsuloff in 1934. Urine is injected into hypophysectomized frogs, and if the frog assumes a dark color half an hour to two hours later the urine is from a pregnant woman. Since the same reaction follows if hypophysial extracts are injected, it is ascribed to the melanophore hormone. The authors used this test on 400 specimens of urine. The outcome was positive in 253 and negative in 147 cases. Verification after three months revealed that the outcome had been correct in 399 cases. The one erroneous result was obtained in a woman of menopausal age.

Operative Treatment of Incontinence of Urine in Women.—Of Christensen's 8 severe cases of incontinence of urine treated by Göbell-Stöckel's operation 5 were due to birth trauma; 3 were in nulliparas. The results were good in all cases. He says that in women who have borne children but do not have genital prolapse simple plastic operation is probably the normal method, but 4 of the 5 had previously been operated on by this method without success. In nulliparas simple plastic surgery is not rational. Göbell-Stöckel's operation is perhaps preferable in all cases of incontinence of urine without genital prolapse requiring treatment.

Book Notices

Human Embryology. By Bradley M. Patten, Professor of Anatomy in the University of Michigan Medical School, Ann Arbor, Michigan. Fabrikoid. Price, $7. Pp. 776, with 1,366 illustrations. Blakiston Company; 1012 Walnut St., Philadelphia 5, 1946.

This completes a series of three textbooks on the subject of development by Professor Patten. It is a much more complete treatise than either of his little books on chick and pig embryos. While the emphasis is decidedly on the human species, the factual material is by no means confined to that. Observations and experiments in embryos and fetuses of many species have been coordinated with the knowledge which has been obtained by studying man. The result is a readable and well organized textbook on the subject of development. In fact, it is more than a textbook for beginning students; it will be of great interest to more advanced readers.

After an introduction, in which the history of the science of embryology is dealt with all too briefly, fifty pages are devoted to gametogenesis, the sexual cycle and fertilization. These are well treated, clearly written and adequately illustrated, providing in concise form basic factual matter needed to understand the origin of embryonic life. Cleavage, germ layers, early differentiation of the embryonic body and establishment of organ systems take up the next eighty pages of the book. Thus are concisely covered the subjects which usually comprise the major part of a college course in embryology. The succeeding chapters on the fetal membranes and placenta and human fetal-maternal relations complete what might be considered basic embryology. Mastery of this first part of the book is a requisite to the study of medicine. Appreciation of adult body structure is dependent on knowledge of such facts as these.

The seventh chapter of the book, dealing with embryonic age, growth and changes in external form of the body, and chapter eight, on teratology and twinning, are handled in a most capable fashion. No doubt the author has given much thought to ways of limiting the amount of factual material to a satisfactory fraction of the book. Such interesting subjects easily could have been overwritten.

The greater part of the book is devoted to systemic embryology; that is, the development and histogenesis of the various organ systems of the body. Comprising the last two thirds of the book, this will appeal to the more mature student because it requires some knowledge of gross anatomy and histology. Reading these sections on the organ systems, one is at once impressed by gaps in our knowledge of histogenesis, especially in later stages. Any one who feels that the embryologist has run his course of investigation has only to read such chapters as those on the nervous system and sense organs to realize how much remains to be learned concerning development of the human body.

Professor Patten concludes each chapter on systemic embryology with a section on anomalies encountered in that system. Most of these accounts are exceedingly interesting and the only criticism that might be raised is that this part of the subject may be overemphasized, though of course this is purely a matter of personal opinion. Some may be led to conclude that the purpose of embryology is to explain abnormalities.

The chapter on development of the nervous system seems to be less well organized than some other parts of the book. It is prefaced by a synopsis of neuroanatomy and neurophysiology, in ten easy pages, containing no illustrations other than a complex schematic diagram of fiber tracts. It is doubtful that this part of the chapter serves a useful function because beginning students will not find the remainder of the chapter clearly understandable without first obtaining a more considerable knowledge of anatomy and neurology. Some of the more neurologically-inclined readers may feel that full advantage has not been taken of all recent investigation in the field of histogenesis of the nervous system. For example, hardly more than one page is devoted to the autonomic nervous system, and the one illustration does not provide all the information desired.

Chapters on development of the face, jaws and teeth, the digestive and respiratory systems and the body cavities and mesenteries are well done. One wonders, however, why fetal swallowing and gastrointestinal movements were not considered, when fetal respiratory movements in utero were; and especially so when the former phenomena are well established and the latter is of doubtful occurrence. The acceptance of such concepts as that expressed in the author's statement that "the partial distention of the pulmonary lobules regularly seen in sections of certain areas of fetal lungs strongly suggests that the aspiration of a certain amount of amniotic fluid is a regular intrauterine occurrence" indicated an uncritical evaluation of experimental evidence available in the literature.

The endocrine glands and derivatives of the embryonic pharynx form the subjects of chapter seventeen. Chapter eighteen is devoted to the development of the urogenital system. The final chapter, nineteen, has to do with the formation of the blood vascular system and heart as well as the lymphatic system. As is to be expected from the author's research interests, the account of the heart is especially noteworthy. The concluding pages of the last chapter of the book are devoted to postnatal changes in the circulation. Professor Patten accepts the concept of crossing caval blood streams in the right atrium of the fetal heart, but with reservations. It would seem that rather more emphasis has been placed on demonstrable structural observations than on physiologic experiments. The account as it stands will not receive the wholehearted approval of all students of the subject.

One of the most useful contributions that Professor Patten has made in this textbook is the publication of a large number of new illustrations, many of these from his own collection of human embryos and others from scientific articles of recent date. The generous use of photographs and of color in drawings is commendable. Of course there are many places in the book where one would wish for illustrations which are not there.

Any first edition is bound to have defects of omission. This one is no exception. For example, nothing is included about the histogenesis of the spleen, an organ of more importance to the embryo and fetus than to the adult. In the central nervous system, not all of the illustrations are well chosen. For example, figure 220 leaves a great deal to be desired.

An extensive bibliography will be found at the back of the book containing references to the principal sources of information. This bibliography is arranged according to chapter. In a sense it forms an appendix, for there is no system of reference numbers throughout the text to direct the reader's attention to particular sources of information. When one tries to follow the bibliography while reading the text one has the feeling that the author would have guarded the accuracy of his statements more closely had he used the method of specific reference while writing.

In spite of the several shortcomings—and any first edition of a book so comprehensive as this is bound to have shortcomings—this textbook is a noteworthy contribution to the subject of embryology. Those who have followed the course of its preparation and have looked forward to its appearance in print will, to be sure, not be disappointed in the result of Professor Patten's labors. A word of commendation is also due to the publishers. The book is most attractive.

Leprosy. By Sir Leonard Rogers, K.C.S.I., C.I.E., M.D., and Ernest Muir, C.I.E., M.D., F.R.C.S., Medical Secretary, British Empire Leprosy Relief Association, London. Third edition. Cloth. Price, $7. Pp. 280, with 88 illustrations. William Wood and Company, Mt. Royal & Guilford Aves., Baltimore 2, 1946.

The authors characterize the first edition of this book as a summary of previous literature of practical bearing and a clear description of the clinical and therapeutic aspects of leprosy. It was presented for the use of "workers" in affected countries. The present edition is a compend of historical accounts, modern reports and citations relative to epidemiology and prophylaxis written by one author; and a discussion of etiology, clinical findings and treatment by the second author. It is a duodecimo volume of 266 pages, exclusive of bibliography, whose scope includes all phases of the subject from ancient beliefs and traditions covering its origin to the minutiae of a metatarsectomy, with a photograph of the resultant scar and the preparation of a film for bacteriologic examination. Sixty odd clinical photographs are appended which, on the whole, are easily decipherable. A half dozen reproductions of histologic pictures interpolated among them are indistinct. The preparation of sections or subsections on epidemiology, communicability; etiology, incubation and incidence suggest that they were developed independently of one another. This impression arises because of repetitions and personal opinions which are somewhat confusing to a reader if indeed they are not conflicting. One author lays great emphasis on a correlation of incidence, rainfall and latitude while the other, in commenting on the influence of climate on incidence, states that "it must be remembered that hot moist climates are commonly inhabited by people in a low stage of civilization living in overcrowded houses, conditions predisposing to infection." Both recognize the probable influence of intimate contact in the spread of the disease. The divisions of the subject, the subheadings, their sequence and the style of presentation suggest a series of conversational or pedagogic discussions in which, somewhat in consequence, there are numerous reiterations. Opinions are offered in explanation of natural phenomena of the disease which are rather categorical, though there are passages elsewhere in the text which show that the authors are aware that proof of their conclusions is lacking. The simplicity and clarity of the writing and the comprehensive range of facts and observations appear to have accomplished well the purpose of these two experienced students in the development of a practical manual for the workers in leprosy in the more severely affected countries.

Are You Considering Psychoanalysis? Edited by Karen Horney, M.D. Cloth. Price, $3. Pp. 262. W. W. Norton & Co., Inc., 70 Fifth Ave., New York 11, 1946.

This book represents another promotion of the "Association for the Advancement of Psychoanalysis." Most trained and experienced psychoanalysts do not agree that the association advances the science of psychoanalysis, although many doubtless agree that the publications are intended to advance ideas which have been promulgated by the association and particularly by Karen Horney and her followers. Dr. Horney and a few of her adherents withdrew from the American Psychoanalytic Society (which was a natural outgrowth of the International Psychoanalytic Association) to found their own association and school. This new school apparently exists only in New York. All other schools or, as they are called, "institutes for psychoanalysis" are affiliated with the American Psychoanalytic Association. At present affiliated institutes are located in New York, Chicago, Detroit, Washington, Baltimore, Topeka, Los Angeles and San Francisco.

When Freud first published his findings, which in the beginning consisted of theoretical conclusions and deductions as well as undisputable evidence of the presence and strength of the unconscious (repression), his writings stirred up considerable antagonism, particularly to the acceptance of an unconscious but also to the fact that his patients inevitably led the way back to early (infantile) sexual conflicts. No one will accuse Freud of directing his patient's conscious or unconscious thinking, and therefore he reported only what was unfolded to him during psychoanalytic consultations. Now Horney and her school, in this and other publications, have capitalized on this resistance to early sexual conflicts as being of paramount importance in the production of neuroses. Neither Freud nor any of his followers ever claimed, as Horney and her followers infer, that sexuality is the only conflict. To minimize its importance as the Horney school tries to do would appear to be an attempt to seduce prospective patients into the belief that the only really good psychoanalysts today are those who belong to this small minority group. This is particularly well illustrated in the chapter "Who Should Your Analyst Be?" After much compulsive rambling the author, Dr. Harold Kelman, comes eventually to the inevitable (for him) conclusion that the analyst of choice, be it male or female, should of course be a follower of the Horney school.

The book is well written and contains many thoroughly sound observations which have been made previously by other writers who were not so prejudiced but were open minded to the experiences and conclusions formulated by their co-workers in this field. Psychoanalysis has become more and more widely accepted as a sound, basic, scientific approach to the study and treatment of personality disorders and as such every conscientious student and practitioner will accept any conclusion that can be proved, while questioning those which cannot. This book, which will probably have appeal to the lay reader, is not recommended to the medical profession.

The Essentials of Obstetrics and Gynecology. By William Albert Scott, B.A., M.B., F.R.C.S., Professor of Obstetrics and Gynecology, University of Toronto, Toronto, and H. Brookfield Van Wyck, B.A., M.B., F.R.C.S., Assistant Professor of Obstetrics and Gynecology, University of Toronto. Cloth. Price, $5.50. Pp. 390, with 91 illustrations. Lea & Febiger, Washington Square. Philadelphia 6, 1946.

This small manual contains many useful and essential facts about obstetrics and gynecology, but unfortunately some subjects are treated too briefly. Thus the entire subject of sterility is discussed in three and a half pages, and the menopause is described on only one page. On the other hand, more than a page is devoted to dyspareunia which is far less important than the menopause, and seven pages and six illustrations are given over to congenital malformations. Only half a page is devoted to the Rh factor, and the word erythroblastosis does not even appear in the index.

The authors state that "spinal and local anesthesia during labor have their advocates but are not widely used." This is undoubtedly true in Canada but not in the United States, where both forms of anesthesia, particularly spinal, is being used more and more. The conservative treatment of eclampsia is properly emphasized. The use of a hydrostatic bag for the treatment of placenta previa is described and illustrated, but fewer and fewer obstetricians use this procedure. Likewise the authors advocate the Braxton Hicks version for certain cases of placenta previa, but this dangerous manipulation is now seldom used in the United States.

The authors should omit mention of the Walcher position (p. 186) because it has been proved to be based on misinformation. In the section on forceps operations only axis traction forceps are illustrated, and in the description of "the essential characteristics of the instrument in general use" the authors include "traction and application handles" as if to imply that all or most obstetricians generally use axis traction forceps. This is not the common practice in the United States. Among the essential conditions for forceps delivery one finds that "there must not be undue disproportion between the maternal pelvis and the fetal head" despite the sounder view that there must not be any disproportion whatever when delivery is attempted through the vagina. Nevertheless the book is definitely of value. It is well written and beautifully illustrated and the type is clear and easily readable.

Die periphere Innervation: Kurze übersichtliche Darstellung des Ursprunges, des Verlaufes und der Ausbreitung der Rückenmarks- und Gehirnnerven sowie der Nerven des autonomen Systems mit Berücksichtigung wichtigster pathologischer Verhältnisse. Von Emil Villiger. Bearbeitet von Eugen Ludwig, o. ö. Professor der Anatomie in Basel, Basel, Switzerland. Tenth edition. Cloth. Price, 16 Swiss francs. Pp. 172, with 71 illustrations. Benno Schwabe & Co., Klosterberg 27, Basel 10, 1946.

This textbook has for a long time been in use in Europe. The peripheral nerves are carefully traced anatomically and functionally from their first neuron to their final nerve ending. Included in this anatomic consideration are the cranial nerves and the autonomic nervous system. The final chapter is devoted to a discussion of lesions of the peripheral nerves, with which the authors have apparently had a wide experience. The entire text is well illustrated with excellent line drawings and photographs. There are two very clear schematic representations of the muscular supply by segments of the upper and lower extremities. For those to whom the reading of German literature is not a difficult problem, this book is recommended as a concise and carefully written consideration of the peripheral nerves.

Psychobiologic Foundations in Dentistry. By Edward J. Ryan, B.S., D.D.S. Fabrikoid. Price, $3. Pp. 131. Charles C Thomas, 301-327 E. Lawrence Ave., Springfield, Ill., 1946.

This is a very unusual book to come from the pen of a dentist. It is also unusual and delightful to follow the logical, forward thinking of a writer who is so modest that he states in the preface "This monograph on psychobiology in dentistry has many limitations, the chief one being the incompetence of the author." Every dentist and physician can read this book with interest and profit. It marks the beginning of a correlation of dentistry with psychosomatic medicine, and the author presents an excellent approach to the recognition that dentists can profit greatly through at least some understanding of the underlying dynamic psychology of his patients. The book is well written. It has a good index and an excellent bibliography.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

EXFOLIATIVE DERMATITIS FROM GOLD

To the Editor:—What treatment could be used for a generalized exfoliative dermatitis due to gold therapy? A white woman aged 36, suffering from chronic rheumatoid arthritis, was treated elsewhere by two doctors, one of whom used myochrisine and the other auro-thio-glyco-anilide. The patient stated she received numerous injections from each doctor but is unable to say how many. The exfoliative dermatitis began four months ago and affected the entire skin, including the scalp and the nails. Generalized desquamation occurred twice, but scales have reappeared on the scalp and the upper and lower extremities at least four times thus far. There is patchy discoloration (purplish brown) throughout except on the back, where it is solid rather than patchy. Borated glycerin and sodium bicarbonate baths partially relieve the intense itching. Petroleum partially relieves the excessive dryness of the skin. Protein powder and mixed vitamins were administered as adjunctive treatment. What further measures can you advise for the dryness, itching and recurrent scaling? Is it likely that the pigmentation noted will completely disappear?

M.D., West Virginia.

ANSWER.—British antilewisite (BAL) (Hynson, Westcott & Dunning) has been used in several cases of dermatitis due to gold with gratifying results. However, the number of cases is as yet too few to be conclusive and the response to BAL was most satisfactory when the rash had been present for less than two months. In 1 case in which the rash had been present for over three months, improvement following the use of BAL did not occur, since presumably after about three months the process tends to become irreversible. At present, with its apparent innocuousness, BAL should be tried. BAL is prepared as a 10 per cent solution and for a person weighing 150 pounds (68 Kg.) the dose has been 150 mg. (1.5 cc.) five times a day for one day, four times a day for two days and three times a day for three days. This should be given deep intramuscularly. Toxic symptoms consist of nausea and vomiting, fibrillary twitchings and salivation. If these appear, the next dose should be omitted. When BAL is effective the pruritus usually stops within twenty-four hours of the institution of treatment. If the pruritus is not affected by BAL, radiotherapy can be tried and is helpful at times. For local application, petrolatum ointment with 1 per cent phenol can be used and is apparently not harmful. It is unlikely that the pigmentation will completely disappear within five or ten years.

Further information may be found in the item entitled "Exfoliative Dermatitis After Chrysotherapy" in Queries and Minor Notes, THE JOURNAL, Feb. 15, 1947, page 507. Three original articles on this subject will appear in THE JOURNAL at an early date.

DDT FOR PEDICULOSIS

To the Editor:—I am requesting information relative to the use of DDT powder in treating pediculosis in children. On a number of occasions public health nurses have asked about the use of DDT powder in such cases. I consulted the California State Department of Public Health and was advised to wait until the use is standardized and the product more available. The Chemurgic Company of Richmond, Calif., sent a sample of the DDT powder, 10 per cent in talcum, to one of our branch offices, to the district public health nurse who wants to know about its use in pediculosis treatment. I will appreciate any information relative to the use of this powder for pediculosis specifically and also other uses.

Hilda Schneider, R.N., Redwood City, Calif.

ANSWER.—DDT powder, a mixture of DDT with an inert diluent such as talc or pyrophyllite, is highly effective against head lice. The effectiveness of different concentrations of DDT in powder form against head lice has not been completely investigated. However, a sufficient number of naturally infested cases have been treated to show that one thorough application of a powder containing 10 per cent of DDT will completely eradicate an infestation. A powder containing as low as 0.25 per cent of DDT will completely eradicate the lice, but this low concentration is effective for only a short time. It is suggested that the amount of DDT in the preparation used be at least 5 per cent.

Since DDT will not kill or remove the nits (eggs), the powder should be allowed to remain in the hair for approximately ten days so that it will kill the hatching nymphs and also protect against reinfestation from other sources during and after the delousing period. Viable nits or live lice that are often scattered about the home may serve as a source of reinfestation. Although DDT powder does not appear to be toxic to man, the eyes of the patient being treated should be covered.

Solutions or emulsions of DDT also have given excellent results against head lice. These preparations should contain at least 1 to 2 per cent of DDT and should be used with caution, since DDT in this form is much more toxic to man than it is in powder form; however, solutions have been used extensively by the military services without any injuries. Directions for use are the same as those mentioned for the DDT powder. One application should be sufficient if the material is not removed from the hair. A paper on the use of solutions and emulsions is to be published in the *Journal of Investigative Dermatology.*

Ten per cent of DDT in talc or pyrophyllite can also be used effectively against pubic lice. The powder should be applied to all hairy portions of the body and rubbed in thoroughly. The treatment should be allowed to remain on for twenty-four to forty-eight hours. Since DDT is not ovicidal, a second application seven to ten days after the first is necessary.

VERRUCA PLANA JUVENILIS

To the Editor:—A white woman aged 32 has had juvenile verrucae involving the face, hands and forearm for the past four years. During that time competent dermatologists have treated her with bismuth compounds intramuscularly without success. One week ago the warts became elevated, painful, itchy and red. The patient is allergic to shellfish, but this has been eliminated from the diet. Sodium bismuth triglycollamate 40 mg. three times daily is being given by mouth and zinc oxide ointment locally without relief. What suggestions can be offered as to further therapy directed both toward alleviating the painful itching and toward eradicating the warts?

M.D., Pennsylvania.

ANSWER.—Verruca plana juvenilis is most common on the hands and face in children. Occasionally the disease occurs in young adults. Its response to therapy is capricious. The same remedies may be met in some cases by extreme stubbornness and in others by successful results. Unlike that of most other warts proper treatment is with systemic measures, unless the manifestations are several lesions only. Inorganic arsenic such as solution of potassium arsenite or the Asiatic pill, mercury and bismuth have all been successful. Locally sulfur is recommended. Solution of sulfurated lime, or Vleminckx's solution, is a convenient form to employ. Wet dressings in the strength of 1 to 5 per cent or painted on 25 to 100 per cent are at times successful. X-rays sometimes are highly successful. One-fourth unit at weekly intervals for six treatments may be used. If not successful, more than this number is not apt to do more good. The lesions not infrequently may show signs of irritation and activation prior to involution. This may be the condition in the case described in the query.

TREATMENT OF POSTHERPETIC PAIN

To the Editor:—A patient had severe herpes zoster three months ago which extended around the chest at the level of the tip of the scapula. The patient continues to have severe pain. Please discuss treatment.

H. A. Amesbury, M.D., Clinton, Iowa.

ANSWER.—The treatment of chronic postherpetic pain is usually unsatisfactory. Before radical therapy is advised, the following measures may be tried in the order recommended: (1) posterior pituitary injection once or twice in twenty-four hours, (2) quinine hydrochloride as tolerated, (3) two intravenous injections of sodium salicylate, (4) 150 mg of thiamine hydrochloride hypodermically three times a week for at least four weeks and (5) cobra snake venom.

If these measures fail, the patient should be referred to a neurologic surgeon, who may do a root resection on the side of the involved area.

TRICHOMONAS PROSTATITIS

To the Editor:—A man aged 45 had gonorrhea seventeen years ago which was cured. One year ago he noted the appearance of a small amount of pus from the urethra in the morning only. This has not caused any discomfort. Many trichomonads were found in the pus but no gonococci. The patient was given 500,000 units penicillin in five doses at two hour intervals without improvement. Please discuss further treatment.

M.D., Minnesota.

ANSWER.—Before treatment is instituted a diagnosis should be established. A chronically infected prostate may harbor the trichomonads, or urethral strictures may cause the infection to persist.

Urethral irrigations with acriflavine and acetarsone by mouth are adjuncts to routine treatment in trichomonas infestation of the male lower urogenital tract.

Treatment also must include the cure of Trichomonas vaginalis of the sexual partner to preclude reinfection.

MALE HORMONE THERAPY IN CANCER

To the Editor:—A woman aged 42 had a radical mastectomy two and a half years ago with microscopic report of duct cell carcinoma with scirrhous change followed by intensive x-ray therapy of the chest. Following an attack of virus pneumonia three months ago the patient continued to have severe shortness of breath, and serial x-rays reveal pulmonary involvement of a fine infiltrating mass with nodules over the left lung; the infiltration has penetrated both lung areas, especially at the bases. X-rays of the skull reveal two areas of decalcification the size of a 25 cent piece believed to be metastatic. Assuming these to be metastatic lesions secondary to carcinoma of the breast, the patient is now receiving 75 mg. of testosterone propionate daily for thirty days, after which it is hoped to treat her symptomatically. The patient is now ambulatory, has gained 12 pounds (5.4 Kg.) and the present complaint is slight weakness and shortness of breath. What is the effect of androgen on regression of cancer tissue when it involves bone and lungs with high dosages? (The sedimentation rate is 25 and blood calcium 7.5.) What are the indications for repeating endocrine therapy? Will permanent sterility result from the dosage given? To date the menses have been extremely regular, but since the beginning of therapy one week ago the present period has been delayed and altered. Is therapy to be followed for relief of pain when metastasis to the long bones is detected (none at present) other than morphine? The high dosage being used was recommended by a prominent breast specialist associated with the Memorial Hospital of New York, and it is assumed that this form of therapy is now being used at that institution. It is planned to submit the patient to further x-ray therapy to the chest and possibly the skull, even though symptoms are not present.

M.D., New York.

Answer.—From the evidence available it appears that large amounts of testosterone propionate may in some instances produce a deposition of calcium in osseous metastases secondary to carcinoma of the female breast. Concomitant with this change in the character of the metastases is an amelioration of the pain. If the pain recurs after cessation of this therapy, relief may sometimes be obtained by the further administration of androgens. There is no conclusive evidence as yet that pulmonary metastasis is influenced by this method of treatment. A temporary amenorrhea is produced by androgen therapy. The usual method for controlling pain due to osseous metastases is to employ high voltage irradiation at the site of the lesions. The value of x-ray therapy in metastatic pulmonary disease and in asymptomatic osseous lesions is extremely doubtful.

SAFE LEVEL OF FLUORINE IN WATER

To the Editor:—What injurious results can be anticipated from prolonged exclusive use of drinking water containing 0.5 part per million of fluorine? Water intake is necessarily high in this arid climate—probably four times the average.

Gordon F. Helsley, M.D., Dealth Valley, Calif.

Answer.—Under ordinary conditions injurious results should not follow the exclusive use of domestic waters containing 0.5 parts per million of fluoride. In instances of an unusually high intake due to climatic conditions, some of the minor manifestations of endemic dental fluorosis might be expected to show. If the water intake is approximately four times the average consumption, one might expect effects somewhat comparable to those now present at Galesburg, Ill., or at Elmhurst, Ill. (1.8-1.9 parts per million of fluoride). An examination of the permanent teeth of a number of children who have used the water in question exclusively should quickly disclose whether or not this water is producing any untoward dental effects. In the absence of pronounced dental manifestations, nondental systemic effects would not be anticipated. At low levels of fluoride intake urinary excretion (and under high temperature conditions an additional significant elimination of fluorine in perspiration) seemingly maintains a state of fluorine equilibrium in the human organism.

ISOPROPYL ALCOHOL FOR STERILIZATION OF METAL INSTRUMENTS

To the Editor:—In view of the shortage of ethyl alcohol, I should like to know if isopropyl alcohol is just as effective for purposes of sterilization of metal instruments. What percentage by weight or by volume would be required? The medicated ethyl alcohols on the market are either highly perfumed or contain ingredients which are sometimes irritating or have an unpleasant odor.

E. William Abramowitz, M.D., New York.

Answer.—Isopropyl alcohol is a somewhat stronger germicide against vegetative forms than is ethyl alcohol. In addition it has advantages of lower surface tension and greater fat solvent action. The maximum bactericidal concentration of isopropyl alcohol is full strength, as compared with a maximum bactericidal concentration of 70 per cent by weight for ethyl alcohol. The best grades of commercial isopropyl alcohol are said to be 98 to 99 per cent. The small water content of these solutions renders them less corrosive for metal instruments than the 70 per cent ethyl alcohol solution.

Unfortunately, however, neither ethyl nor isopropyl alcohol can be depended on to kill spores. Brewer (The Journal, May 20, 1939, p. 2009) has shown that scalpels are frequently contaminated with sporulating pathogenic micro-organisms. That is probably true also of needles, scissors and other instruments which come into contact with skin. Immersion in isopropyl alcohol for several hours or even several days is not a trustworthy method of sterilizing such instruments.

Isopropyl alcohol is sold at present in unadulterated form, which is not irritating to the operator's hands or patient's skin.

SUGAR AND DIABETES

To the Editor:—A recent questionnaire in the *Reader's Digest* included this question and answer: "Does the excessive use of sugar—glucose—cause diabetes? Answer: No. Diabetes is a glandular disease and has no relation to excessive ingestion of sugar." Is this statement correct?

Riley Shrum, M.D., Huntington Park, Calif.

Answer.—Practically all authorities agree that excessive ingestion of sugar does not cause diabetes mellitus. As the question in the *Reader's Digest* specifically says "cause diabetes," the answer "No" is correct. Excessive intake of sugar may act as a precipitating factor but not as a primary cause. It is an important factor in the control of diabetes, of course, but, just as increased sugar supply does not cause diabetes, neither does reduction in sugar supply ordinarily cure the disease. In both instances the sugar supply merely brings into the open or else conceals the glycosuria and hyperglycemia which characterize the disorder.

BOROWSKAJA METHOD FOR COLLOIDAL GOLD LIVER FUNCTION TEST

To the Editor:—In doing the colloidal gold (Lange's) test on blood serum for diagnosis in hepatic disorders could the "Borowskaja" modification of colloidal gold be used with the same degree of sensitivity as the method described by Dr. Gray at the University of Chicago?

Clifford W. Atherton, M.D., Stambaugh, Mich.

Anwer.—The sensitivity of colloidal gold precipitation as a test for hepatic disorders is partially dependent on the p_H of the gold sol. "Borowskaja's" method of preparing colloidal gold could probably be used, provided the p_H is adjusted to 7.12 as described by Gray (*Proc. Soc. Exper. Biol. & Med.* **41**:470 [June] 1939) before use each time. In addition, one should carry out control determinations on the serums of normal persons with each batch of colloidal gold.

REMOVAL OF PICRIC STAIN OF HAIR

To the Editor:—A patient used butesin picrate ointment for treatment of a wound in her scalp, and her hair became colored by the picric acid. Is there any method of removing this ugly yellow stain?

Rudolf Wolff, M.D., Mill Valley, Calif.

Answer.—Picric acid is soluble to the extent of 1 Gm. in 12 cc. of alcohol or in 10 cc. of benzene. First, one should attempt to wash out as much of the picric acid as possible by either one of these agents. The picric acid may have combined with the material in the hair to form a protein picrate. It is possible that washing the affected area with a weak alkali, such as sodium bicarbonate solution, will break this bond and remove the picric acid stain.

DANDRUFF

To the Editor:—1. Is ordinary dandruff without apparent scalp disease or symptoms, except the appearance of dandruff on the clothing, a physiologic or pathologic condition? 2. Does it lead or predispose to baldness? 3. Is there any effective treatment to prevent it?

Charles C. Joyce, M.D., Middleboro, Mass.

Answer.—1. Dandruff is generally considered a pathologic condition.

2. Most textbooks state that dandruff predisposes to baldness.

3. There are numerous medicaments and formulas which have been recommended. Sulfur, the mercurials and resorcin have been the most popular for topical applications. They are generally effective but must be used for a prolonged period. Shampoos at appropriate intervals are helpful and important in maintaining proper hygiene of the scalp.

COWPER'S AND BARTHOLIN'S GLANDS

To the Editor:—In the answer to the query "Analogy of Cowper's and Bartholin's Gland" (*The Journal*, Sept. 21, 1946, p. 1045) it is stated that the "strict analogy of these glands may be questioned," since "little is known of the functions of Bartholin's gland and not much more concerning the function of Cowper's gland." I want to stress the fact that the analogy is not only embryologic but also physiologic. Both are sex glands. Bartholin's gland provides the lubricating material necessary for the sexual act, while Cowper's gland participates in the formation of the semen and also lubricates the mucous membrane of the male urethra.

PROLONGED LABOR, WITH SPECIAL REFERENCE TO POSTPARTUM HEMORRHAGE

L. D. ODELL, M.D.
J. H. RANDALL, M.D.
and
G. W. SCOTT, M.D.
Iowa City

Prolongation of labor beyond the commonly accepted normal maximum of thirty hours is not only a trying experience for the patient and her family (and for the obstetrician) but also imposes certain considerable maternal and infantile risks. In the child, recent investigations[1] emphasize the frequency of death from bacteremia and pneumonia; and in the mother, the course of events may lead to intrapartum fever, shock, sepsis and, sometimes, a fatality.[2] The chief of these complications, which is related to the increased danger of intrauterine infection, especially with early rupture of the membranes, has been discussed elsewhere.[1c] In the course of that study it became apparent that postpartum hemorrhage was more frequent than usual following prolonged labor. This prompted the present investigation.

By definition, a labor lasting thirty hours or more is designated "prolonged," one that terminates within three hours is "precipitate" and the remainder are "normal" so far as duration is concerned. When the total loss of blood (measured and estimated) is 600 cc. or more, postpartum hemorrhage is diagnosed.

Among 15,824 consecutive deliveries from July 1, 1926 through June 30, 1942 there were 422 prolonged labors, an incidence of 2.7 per cent (table 1). As might be anticipated, primigravidas were in the majority (66.9 per cent), although the usual ratio in this clinic favors multiparas three to one. By comparison, the incidence of operative delivery and postpartum fever was high, 29.3 and 25.5 per cent, respectively. There were 3 mothers (0.7 per cent) and 44 infants[3] (10.4 per cent) who did not survive. The infantile fatalities were largely due to intracranial hemorrhage incident to the operative delivery, infection and prematurity (table 2). The 3 adult deaths were attributed to puerperal infection rather than to hemorrhage. Two patients died from peritonitis and 1 from embolism on the thirty-first postpartum day. (See the addendums of maternal deaths.)

Premature rupture of the membranes, implicated as a cause of prolonged labor,[4] occurred in 30 per cent of these patients (table 3). In the majority of cases, artificial rupture was performed as an adjunct to induction of labor. Moreover, the relatively low incidence of prolonged labor (2.7 per cent) compares favorably with the 9.0 per cent reported elsewhere[1a] and suggests, at least, that premature artificial rupture of the membranes does not cause protracted labor.

It is generally accepted that the principal causes of prolonged labor are cephalopelvic disproportion which is unrecognized until dystocia becomes apparent, abnormal fetal presentations and uterine inertia. In this series (table 3) there were only 26 pelves (6.2 per cent) that were classified as abnormal and 31 patients (7.3 per cent) in whom the fetal presentation was other than occipital. In addition, the distribution of infants' weights, as compared with "normal" labor, was within the usual limits. It is then obvious that these first two etiologic factors account at most for only 1 of 7 prolonged labors. Most of the remainder must be included in the last, or inertia, group.

Uterine inertia is at best a poorly understood abnormality of the uterine muscular function in which both myometrial contraction and retraction are at fault. The modern concept of uterine physiology during labor associates cervical effacement and dilatation largely with retraction of the lower, passive, segment and expulsion with contraction of the upper, or corporeal, portion of the uterus;[5] but it is probable that synchronization of the two types of muscular activity is essential for the normal birth process. Prolongation of labor is usually due to lengthening of the first stage and, therefore, presumably to lack of proper retraction of the lower segment.

The tocographic observations of Murphy[6] (charts 1, 2 and 3) indicate that first stage uterine inertia is associated with detectable alterations in the size and rhythmicity of the contractions of the corpus, which vary in intensity and tend to be irregular. This suggests either an abnormality of innervation or a failure of proper muscular response. Physiologically, a nerve

impulse sufficient to cause a contraction in either smooth or striated muscle produces an all-out response (the "all or none" law). The innervation of the uterus is derived from the antagonistic sympathetic and parasympathetic systems, with the former causing contraction and vasoconstriction and the latter, relaxation and vasodilatation, and from the cerebrospinal system. Moreover, the uterine muscle is arranged in many fasciculi, each with its supplying nerves and presumably with its nervous threshold. Inertia, then, may well represent a condition in which the uterus does not contract harmoniously, so that contraction (isometric action) does not proceed simultaneously with retraction (isotonic action).

Obstetricians have long recognized the effect of extraneous factors on uterine activity and have believed that the emotions (fear, grief and the like) have a definite effect on the contractions of the organ. Until more is known of the psychosomatic relationship, the etiology of uterine inertia may well be incomplete.

Contraction and retraction evidently combine to produce placental separation and expulsion from the uterus, with contraction seemingly carrying the major burden. Recently, doubt has been directed toward the older observation that administration of oxytocics promotes a much earlier separation of the placenta.[7] Subsequent to birth of the presenting part a solution of either posterior pituitary injection, ergonovine maleate or isotonic sodium chloride solution was administered intravenously and delivery was completed by physiologic uterine expulsion. Although excessive loss of blood was more frequent in those receiving isotonic sodium chloride solution, separation occurred within three minutes in a relatively equal percentage of each group[8] (table 4).

Table 4.—*Effect of Oxytocics, Isotonic Sodium Chloride Solution and Slow Expulsion on Duration of Third Stage (Courtesy of Dieckmann)*

There can be little doubt that retraction, especially of the innermost muscular layers just beneath the decidua, is important in controlling postpartum blood loss. The separation of the placenta from the uterine wall entails the tearing across of many vessels whose ends are left open. In the normal case, there is little hemorrhage because further retraction of the uterus causes a muscular closure of the large sinuses of the uterine wall. Contraction of the remainder of the muscle undoubtedly helps by producing periodic uterine ischemia. *It is a common observation in patients with* unusual loss of blood that recurrent contractions expel blood which has accumulated in the uterine cavity during periods of relaxation, whereas under normal conditions of proper retraction such bleeding is barely noticeable.

This isotonicity of uterine muscle aids in the formation of thrombi. Although it is often difficult to outline the placental site in the immediate puerperium (digital examination), subsequent palpation (eight hours after delivery) will disclose a raised, firm plaque. Moreover, histologic examination of this area shows thrombi within venous sinuses as well as sclerotic thickening, obliteration and thromboses of the spiral artery tips.[9] In the final analysis, the control of bleeding rests in the formation, maintenance and organization of these clots, and any disturbance in this mechanism can precipitate an abnormal loss of blood.

[8] Dieckmann, W. J.: Personal communication to the authors.

It is extremely difficult to evaluate the importance of idiopathic uterine atony in the postpartum loss of blood among patients with prolonged labor. Our figures (table 5) indicate that postpartum hemorrhage occurred in 7.6 per cent of this group as against 4.3 per cent in those women with labors of "normal" duration, but this difference is more apparent than real. Various other factors, such as the duration and depth of anesthesia and the agent employed, the type and difficulty of operative delivery and the competence of the attendant in managing the third stage and early postpartum period, are especially significant. The effect of the first two of these is indicated by the fact that among the 123 operative deliveries there were 13 postpartum hemorrhages (10.5 per cent), while the incidence fell to 6.4 per cent in those delivered spontaneously. Thus, even after largely discounting the trauma of operation and the effect of more prolonged and deeper anesthesia, postpartum hemorrhage was 50 per cent more common among women who had prolonged labors but were spared these traumas than among those with labors of normal duration.

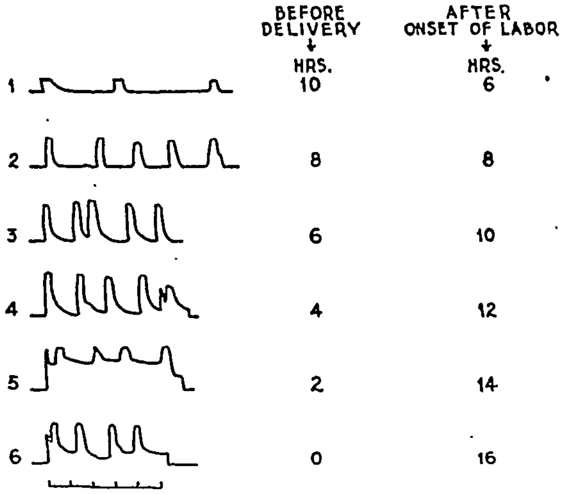

Chart 1.—Record of normal uterine contractions occurring in a labor of sixteen hours' duration; time interval, three minutes. Adapted from Murphy.

The effect of the third factor influencing loss of blood, the method of handling the placental stage of labor, is related to the experience of the operator. In our series the majority of uncomplicated labors were conducted by senior medical students and interns, who generally can be expected to encounter a higher incidence of postpartum hemorrhage than the resident and staff physicians who usually handle complicated cases. On this basis the hemorrhage incidence of 4.3 per cent after labors of normal length is higher than it should have been.

Such an analysis suggests that postpartum uterine atony leading to excessive loss of blood is perhaps twice as common in women who have exhibited inertia leading to the prolongation of parturition as in those whose uterine function is not thus disturbed. The surprising fact is not that the inertia should occasionally carry over to the postpartum period but rather that so many uteri which show defective first and second stage muscular activity should be able to exhibit proper contraction and retraction after expulsion of the fetus.

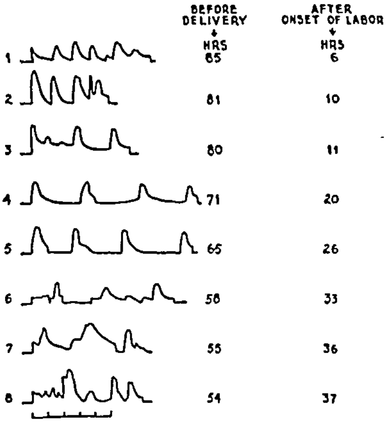

Chart 2.—Record of normal uterine contractions observed during labor of ninety-one hours' duration; time interval, three minutes. Delay in delivery was due to disproportion. Adapted from Murphy.

It has also been suggested that unusually rapid labors (under three hours' duration) may likewise be associated with postpartum hemorrhage because of incomplete retraction of the uterine muscle.[10] In such cases it is obvious that lower segment retraction, as demonstrated by the rapidity of cervical effacement and dilation, has kept pace with the strong upper segment contractions and that atonic postpartum bleeding must be attributed to failure of the subendometrial muscular layers to retract promptly. This variable response of two areas of the same organ is not inconceivable nor is the other possibility that muscular retraction involves a time element and that in precipitate labors a definite latent period imposes the risk of abnormal loss of blood. Our data (table 5) show a slight and probably insignificant increase in the incidence of postpartum hemorrhage in precipitate labors (5.3 per cent as against 4.3 per cent in "normal" labors).

As has been said, the cause of uterine atony is unknown despite many efforts to explain it. The vagaries of its occurrence, and especially the fact that ineffective or abnormally effective first and second stage contraction and retraction are generally followed by normal third stage and early postpartum activity, argue against disturbances of the hormonal or acid-base balance as etiologic factors. Such alterations could not logically explain the rapid change from

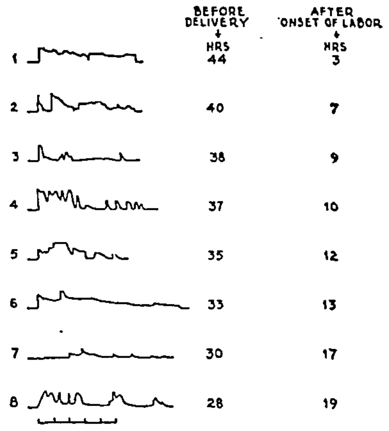

Chart 3.—Record of abnormal uterine contractions (inertia) throughout a labor of forty-seven hours' duration; time interval, three minutes. There was no evidence of disproportion. Adapted from Murphy.

abnormal to normal function seen so frequently after expulsion of the child.

Proper conduct of the third stage of labor, permitting the uterus to contract and retract normally, is probably the best prophylaxis against atonic hemorrhage, in spite of the fact that loss of blood can be reduced on the average by the early exhibition of oxytocic drugs. In the presence of atonic bleeding, massage and oxytocics generally produce adequate retraction. Intrauterine douches, preferably with cold, sterile water, and thorough tamponade of the uterine cavity will occasionally be demanded. Prompt restoration of the circulating blood volume, initially with isotonic solution of sodium chloride or dextrose solution or with plasma, and later with whole blood, is most effective in preventing or combating shock with its threat of death.

SUMMARY

In this series uterine inertia was the principal cause of prolonged labor, cephalopelvic disproportion and abnormal fetal presentation, accounting for only 13.5 per cent of the cases. Uterine contraction and retraction are vitally concerned with the length of labor, with spontaneous placental separation and with the physiologic control of bleeding from the puerperal uterus.

Postpartum hemorrhage was more frequent following prolonged labor. This increased tendency toward abnormal loss of blood was due largely to prolonged anesthesia and the trauma of operative delivery but after nonoperative deliveries was on the basis of postpartum uterine atony. Astute anticipation of this tendency to bleeding, with careful conduct of the third stage, early uterine massage and exhibition of oxytocic drugs, as well as the liberal and early use of fluids and whole blood when abnormal loss of blood occurs, is recommended for the prevention and control of hemorrhage and shock.

ADDENDUM OF MATERNAL DEATHS

CASE 1.—A woman aged 23, nullipara unigravida, was admitted several hours after a delivery which had been completed outside the clinic. After a seventy hour labor the patient had been delivered by a high forceps operation and transported 140 miles to the hospital. The symphysis pubis was separated, the bladder and urethra torn and pelvic tissues severely damaged. There had been no hemorrhage. Subsequent to admission her condition became progressively worse, and death occurred two days later. Autopsy was refused.

CASE 2.—N. C., a woman aged 23 years, nullipara unigravida, was admitted with a six months gestation for treatment of gonorrhea. Labor commenced spontaneously near term. After a seventy-seven hour labor a 2,700 Gm. male, living infant was delivered by low forceps. The blood loss was 300 cc. The puerperium was uncomplicated until the seventh day, when signs of a puerperal thrombophlebitis developed. Death occurred suddenly on the thirty-first postpartum day. Autopsy confirmed a diagnosis of death from pulmonary embolus.

CASE 3.—R. S., a woman aged 21, bipara multigravida, was admitted at term. After artificial rupture of the membranes, medical induction of labor and twenty-four hours of labor a transverse presentation was recognized. Attempts at correction failed. After fifty hours of labor a Porro's cesarean section was performed. The loss of blood was minimal. However, a dehiscence of the abdominal wound occurred on the fifth postoperative day. During the secondary closure a generalized peritonitis was recognized. Death occurred on the tenth postoperative day. Autopsy was refused.

ABSTRACT OF DISCUSSION

DR. DONALD A. DALLAS, San Francisco: Dr. Odell has shown clearly that postpartum hemorrhage in prolonged labor is more common than it is in normal. He has stated that postpartum hemorrhage in itself can cause maternal mortality and that it frequently contributes to the mortality caused by other conditions, such as puerperal infection. He attributes postpartum hemorrhage in prolonged labors to three main causes: prolonged deep anesthesia, trauma of operative delivery and uterine atony. In my opinion the uterine atony is far more important than the other two causes. There are available numerous methods of treatment to prevent postpartum hemorrhage. Far more important than these methods is the consciousness on the part of the attendant that the consequences of blood loss during and shortly after labor are serious, and it is true particularly in those patients who have undergone a prolonged labor. The third stage of labor has always been neglected both in medical schools and in textbooks. This lack of consciousness of the seriousness of loss of blood was beautifully illustrated on Monday morning here in San Francisco, when I took Dr. Odell to one of our teaching hospitals to show him the beautiful facilities available for teaching clinical obstetrics. We walked into a space behind the glass partition and looked into a beautifully equipped delivery room. On a complicated and elaborate table lay a recently delivered patient. A basin containing a placenta and about 500 or 600 cc. of blood stood on a table nearby. There were three interns in the delivery room. Two of them were holding an animated conversation and the third was occupied in instilling silver nitrate into the eyes of the newborn baby. While we stood there, watching, the patient on the table began to bleed profusely. None of the medical attendants noticed this hemorrhage, and it was only by violently rapping on the glass partition that we were able to call these doctors' attention to the fact that the patient was really bleeding profusely. All that was necessary to stop this hemorrhage was simple gentle massage of the uterus. One of the interns walked over and massaged the uterus gently, the uterus contracted and the bleeding ceased. I think it might not be too fantastic an idea to have medical schools install in their delivery rooms some kind of a device which would repeatedly call the attention of interns and medical students to the fact that blood must be conserved during the third stage of labor.

DR. PENDLETON TOMPKINS, San Francisco: Dr. Randall and Dr. Odell stated that the incidence of prolonged labor in their very large series was 2.7 per cent. The etiologic factors were an abnormal pelvis in 6 per cent, a faulty presentation in 6 per cent and uterine inertia in 87 per cent. They have well discussed the treatment, but little has been said about prevention. There is nothing which can be done to prevent a patient coming in with an abnormal pelvis. There is nothing the physician can do about faulty presentation except occasionally in breeches. But about inertia, there is a good deal that may be done. Careful estimation of uterine tone at the time of the onset of labor is often neglected. There are patients who have poor labors and patients who have good labors. The uterus is a muscle and its tone is proportional, roughly, to the tone of all the other muscles. It is therefore incumbent on the obstetrician in his prenatal care to try to develop in his patient good muscular tone throughout—in her intestinal tract, her skeletal muscles and her uterus. He may do this by making certain that the patient obtains a reasonable amount of exercise during pregnancy. The large clinic will have difficulty in evaluating the needs of each patient, because the patients are seen by different physicians at each visit. The private practitioner, on the other hand, knows his patient well. He sees her himself six or eight or ten times during the course of her pregnancy, and he is in a better position than even the well staffed clinic to advise his patient regarding exercise and rest. He is also in a position to initiate labor at the optimum time. He will not induce labor too soon, if he induces it at all, and when the patient comes into the hospital he can evaluate the fatigue which his patient has already experienced during the preceding hours. Psychosomatic influences play a large part in the course of labor. By alleviating fear the private practitioner can do more to avoid inertia of the uterus than by any other means. He must counteract also the effect that fearmongers have on patients, mothers who tell their daughters of their own difficult labors, neighbors who tell of their troubles. He must encourage his patients, to assure them that progress is normal, that he fears no difficulty. Many of Dr. Randall's and Dr. Odell's patients are admitted to the hospital some days before pregnancy reaches term. They wait in the hospital. They become weary and overanxious, and their labors are poor partly for that reason.

Dr. J. L. Bubis, Cleveland: This question of postpartum hemorrhage is very important. Every institution has its own method of taking care of these cases. In the university, where there is a student body, they naturally are more conservative than in the private institutions. When students are watching patients in labor over thirty hours, it is important to give the expectant mother plenty of fluids and sedation. If there is a moderate or borderline dystocia, it is important to wait until the cervix is dilated or dilatable. Those who have watched Potter deliver by dilating the perineum and the cervix followed by a version and extraction have seen that his patients have come through in much better shape than others because they have not had this fear of a prolonged labor and that they were in better physical condition because their labors had been shortened. One of the best procedures in the prevention of postpartum hemorrhage, after the fetus is delivered, is the injection of Pitocin directly into the vein or intramuscularly or into the solution as it is given to these patients. The uterus must be grasped and held firmly and watched for an hour after the delivery and repair. If that does not help, the uterine cavity is swabbed out with a sponge dipped in iodine solution and at the same time counter pressure is maintained on the fundus. Frequently pieces of placenta, membranes and blood clots are wiped out, the uterus contracts and the bleeding then stops.

Dr. Lester D. Odell, Iowa City: In this series there were no maternal deaths which could be attributed to hemorrhage. In fact, the loss of blood was relatively insignificant in each fatality. This probably represents a unique occurrence, since most recent studies list hemorrhage as a leading cause of maternal death.

We agree with Dr. Dallas in that uterine atony is probably the principal cause of hemorrhage following prolonged labor. In this series there was a progressive coincrease in the incidence of operative delivery and blood loss up to 600 cc. But above that amount the rate of operative delivery declined, suggesting that uterine atony became a prime cause for bleeding.

Dr. Tompkins' remarks on the psychosomatic aspects of prolonged labor are pertinent. His outline of treatment at the University of Iowa was correct. However, we do take some pains to improve the general morale of our patients. But they are away from home and are on a charity status. Consequently, their mental attitude cannot be compared to that of private patients.

At the University Hospitals the management of patients with prolonged labor has been individualized. If compared with that in some other clinics it could be called conservative. Intravenous fluids, morphine, supportive nursing and antibiotics in the presence of real or threatened infection constitute what we consider to be intelligent therapy. Hypophamine drugs are not used to hasten labor or to treat uterine inertia. We do do not employ the word "dilatable" since it is not considered to be physiologic. Furthermore, cervical incisions, difficult forceps operations and cesarean hysterectomy are used only for strictly maternal indications. Consequently, the infant mortality rate of 10.4 per cent is probably high; high out of consideration for maternal life, morbidity and future health.

FOLIC ACID IN PERNICIOUS ANEMIA

Failure to Prevent Neurologic Relapse

ROBERT W. HEINLE, M.D.
and
ARNOLD D. WELCH, M.D.
Cleveland

The ability of synthetic pteroylglutamic (folic) acid to induce hematologic remissions in patients with macrocytic anemia associated with megaloblastic hyperplasia of the bone marrow has been well established. A recent review by Berry and Spies[1] covers the subject adequately.

While the results of treatment with folic acid appeared to be similar to or identical with those of treatment with purified extracts of liver, it was recognized[2] that a considerable period of study would be necessary to ascertain whether folic acid would be as effective as extracts of liver in the maintenance of remission. In pernicious anemia it was also of importance to determine whether folic acid would cause arrest of neurologic lesions as effectively as do extracts of liver.

Recent reports[3] have indicated that in some patients with pernicious anemia there develops decided progression of neurologic lesions while they are being maintained on folic acid. The following case is presented in some detail because (1) the neurologic relapse was unusually "explosive" and rapidly progressive and (2) it occurred after the blood had reached and remained at normal levels, including the absence of macrocytosis.

REPORT OF A CASE

O. K., a white man aged 68, was admitted to the Lakeside Hospital complaining of weakness and indigestion. He had had angina pectoris for one year and had been hospitalized about a year before, at which time a diagnosis of coronary thrombosis was made. Since that time he had experienced progressive weakness, burning of the mouth and gums, slight numbness of the hands and inability to distinguish accurately the size of objects placed in his hands. He had also had nausea, indigestion and a bitter taste in his mouth, and frequently he had noted dizziness. There had been a loss of weight of 30 pounds (13.6 Kg.) in the last three months, and it was observed that the skin had assumed a yellow color.

Examination revealed little or no atrophy of the lingual papillae. The skin was a pale, lemon-yellow color. The liver was palpable about 3 cm. below the costal margin in the right midclavicular line. The knee and ankle jerks were absent bilaterally, but other deep reflexes were present, equal and normally active. There was a slight diminution in the vibratory sensation in the right leg below the knee, but it was normal elsewhere. The Romberg sign was absent, and position sense was intact.

Laboratory examination revealed the presence of a macrocytic anemia. The blood findings on admission were: erythrocytes, 1,590,000 per cubic millimeter; hemoglobin, 5.1 Gm. per hundred cubic centimeters; leukocytes, 4,850 per cubic millimeter; hematocrit reading, 17.5; mean corpuscular volume, 110 cubic microns; mean corpuscular hemoglobin, 32 micromicrograms, and mean corpuscular hemoglobin concentration, 28.2 per cent. The differential blood count revealed 43.0 per cent neutrophils, 1.5 per cent eosinophils, 0.5 per cent basophils, 0.5 per cent unsegmented neutrophils, 43.0 per cent lymphocytes and 11.5

This report is part of a study of folic acid aided by a grant from the United States Public Health Service.

From the departments of Medicine and Pharmacology, Western Reserve University School of Medicine, and the Lakeside Hospital.

Central Soc. Clin. Research **19**: 26 (Nov.) 1946. (*b*) Meyer, L. M.: Folic Acid in the Treatment of Pernicious Anemia, Blood **2**: 50 (Jan.) 1947.

per cent monocytes. Many of the neutrophils contained highly segmented nuclei. The erythrocytes showed decided variation in size and shape and were macrocytic. Two normoblasts were seen while counting 200 leukocytes. The blood platelets were slightly reduced in number.

Gastric analysis showed absence of free hydrochloric acid after the subcutaneous administration of 1.0 mg. of histamine. The icterus index was 8 units. Serum bilirubin was less than 2.5 mg. per hundred cubic centimeters, and the van den Bergh reaction was positive direct.

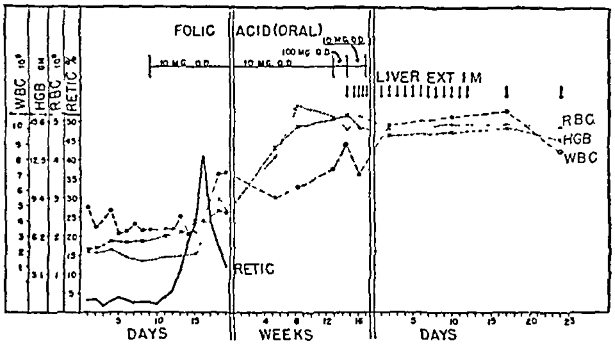
Sternal marrow aspiration was performed, and a well defined megaloblastic hyperplasia was found.

In view of these observations a diagnosis of addisonian pernicious anemia was made and treatment with synthetic folic acid [4] in daily oral doses of 10 mg. was started.

From the accompanying chart it can be seen that a reticulocyte response of 40.6 per cent occurred on the seventh day of treatment and was followed by a satisfactory increase in erythrocytes, hemoglobin and platelets (not charted). Sixty-one days after the start of therapy the erythrocyte count was 5,400,000 per cubic millimeter and the hemoglobin level was 15.1 Gm. per hundred cubic centimeters.

Coincident with the hematologic improvement there was an associated sense of well-being and a definite increase in appetite and general strength. The neurologic symptoms, which had never been pronounced, did not change.

At the time we first saw this patient he had only four teeth, the remainder having been extracted over a period of one to two years. As a result of this, coupled with the naturally poor appetite commonly found in patients with untreated pernicious anemia, his diet had been limited. The intake of food was necessarily restricted to soft and liquid foods even after the remarkable increase in appetite associated with the response to folic acid.



Hematologic data on patient O. K.

Seventy-nine days after the initiation of treatment the patient had the four remaining teeth extracted. Because of the resultant sore mouth and the total absence of teeth the dietary intake was further restricted and consisted entirely of soups, milk and fruit juices for several days. It should be emphasized that the appetite was excellent at this time, and the patient had a desire to eat. Within three or four days after the removal of the remaining teeth there was a sudden pronounced increase in numbness of the hands. In two weeks this had progressed to a point where his arms were completely numb from the elbows downward. The patient was unable to feel objects placed in his hands, even those as large as a pencil. He was totally unable to manipulate buttons, tie his necktie or perform similar actions. At this time there was no numbness in the lower extremities. Examination of the blood revealed: erythrocytes, 5,090,000 per cubic millimeter; hemoglobin, 15.9 Gm. per hundred cubic centimeters; hematocrit reading, 48; mean corpuscular volume, 94.5 cubic microns; mean corpuscular hemoglobin, 31.3 micromicrograms, and mean corpuscular hemoglobin concentration, 33.2 per cent.

The dosage of folic acid was increased to 100 mg. a day, but in ten days the paresthesias of the upper extremities were unrelieved, and the patient noted progressively increasing numbness of the feet. At this time the intramuscular injection of a solution of extract of liver was started, 15 units of purified liver extract (Lilly) [5] and 6 units of crude liver extract (Lilly, 2 units per 1 cc.) being given twice a week. The folic acid dosage was reduced to 10 mg. a day.

Sixteen days after the initiation of treatment with extract of liver the neurologic condition had deteriorated further. The patient felt numb from the hips downward and from the elbows downward. All the deep reflexes were now completely absent. Vibratory sensation was absent below the ribs. There were no pathologic reflexes present, and the heel to knee and finger to nose tests were performed accurately. Throughout this time the appetite remained excellent, the body weight was maintained and general strength was good. Folic acid therapy was discontinued at this time, and treatment with vitamin B complex was instituted (Becotin, Lilly, three capsules a day).

Twenty days after the first dose of liver extract severe lower abdominal pain suddenly developed, and the patient was readmitted to the hospital. He had slight fever for two days (maximum 38 C., 100.4 F.), and became decidedly jaundiced. The icterus index reached a maximal value of 90 units, and the serum amylase attained a level of 72.3 units. A diagnosis of acute pancreatitis was made. Roentgenologic examination of the gallbladder, made on the previous admission, had revealed normal function, and calculi had not been visualized. Within ten days there was recovery from this episode, and the icterus index and serum amylase values returned promptly to normal. During this hospital admission the patient was given daily intramuscular injections of 6 units of crude liver extract (Lilly, 2 units per 1 cc.) and the treatment with vitamin B complex was continued.

Twenty-seven days after the first dose of extract of liver and while the patient was still in the hospital, the first signs of improvement occurred when he noted a slight decrease in the numbness of his hands and was able to tie a bow in a cord. It should be observed that this improvement occurred despite the presence of an infection, pancreatitis. The patient was discharged from the hospital thirty-one days after receiving the first dose of extract of liver, and injections have since been given on a twice weekly basis. Examination thirty-five and forty-two days after the start of liver therapy revealed progressive improvement, in that the patient could tie his shoelaces and necktie and button his shirt. There was also progressive but not complete disappearance of numbness in the upper and lower extremities.

COMMENT

The neurologic relapse in this case occurred in a patient on folic acid therapy who had attained and maintained completely normal blood findings. It occurred suddenly, progressed rapidly and responded to liver therapy slowly. The patients described by Vilter and his associates [3a] likewise displayed sudden onset and rapid progression in their neurologic relapse.

To date we have treated and maintained 47 patients with pernicious anemia with synthetic folic acid for periods up to one year. Of this number, only 2 others in addition to the patient described have exhibited definite neurologic relapse. These relapses were mild and responded readily to therapy with extract of liver. This group of patients will be reported in a later publication.

In all 3 patients in whom neurologic relapse occurred the dietary intake was poor. In the patient described here, absence of teeth prevented normal dietary intake, as was noted before. The other 2 patients were women. One, aged 50, was a person of unstable temperament in whom emotional disturbances caused frequent nausea and vomiting, and who never had a robust appetite. The other, a woman aged 72, never had a good appetite, frequently ate only two meals a day and probably did not consume a fully balanced diet.

---

[4] Synthetic folic acid was supplied through the courtesy of the Lederle Laboratories, Inc.

[5] Liver extracts of this type contain insignificant amounts of determinable folic acid.

The mechanism of the neurologic relapse occurring in this patient is not immediately obvious. The rather remote possibility exists that even larger doses of folic acid might have prevented or caused the disappearance of the symptoms. Neither we nor Vilter and his associates [8a] continued to give the larger doses of folic acid for more than forty days because rapid progression of symptoms during that time made standard effective treatment mandatory. Had such large doses been continued longer it is possible that folic acid alone might have controlled the neurologic relapse.

On the other hand, the "explosive" nature and rapid progression of the relapse occurring in this patient suggests that folic acid not only failed to prevent neurologic relapse in the dosage used but may even have precipitated it. If the hematologic and neurologic manifestations of pernicious anemia are due to deficiency of more than one substance, it is possible that alleviation of the hematologic deficiency with folic acid might precipitate the neurologic relapse as a manifestation of another deficiency not relieved by folic acid. Precipitation of signs of vitamin deficiency in persons deficient in more than one member of the vitamin B complex has been shown to occur when one of the needed vitamins is administered,[6] while the deficiency of the others continues.

If even larger doses of folic acid (100 to 500 mg. a day) fail to prevent or relieve such neurologic relapses it would appear that, although folic acid is capable of producing and maintaining a normal erythrocyte picture, a substance (or substances) other than folic acid is necessary for the maintenance of the integrity of the nervous system. Highly purified extracts of liver have been found to be entirely capable of performing both functions,[7] although the mechanisms of action are not understood. Whether the probably inadequate diets of the patients described contributed to the neurologic relapse by causing deficiency of some substance necessary to maintain the integrity of the nervous system is a matter of conjecture at this time. Such a circumstance is a possibility, however. Neurologic relapse has not been observed as yet in any of our patients who have had a good appetite and have been eating well.

It is becoming obvious, therefore, that folic acid not infrequently fails to control neurologic lesions when given in doses sufficient to maintain normal blood levels. Thus, the clinical use of folic acid as a complete substitute for extracts of liver in treating pernicious anemia is not justified. Although more study will be needed to determine whether massive doses of the vitamin can prevent or relieve neurologic relapses, previous experiences with other members of the vitamin B complex render this circumstance unlikely. It is fortunate that the manufacturers of synthetic folic acid have advised that a combination of folic acid and liver extract may prove more effective than either substance alone.

SUMMARY

Recent reports indicate that synthetic pteroylglutamic (folic) acid does not prevent neurologic relapse in some patients with pernicious anemia.

A case is reported in which "explosive" and rapidly progressive neurologic relapse occurred in the patient after a normal blood picture had been attained and had been maintained with folic acid. The dietary intake of this patient was limited by absence of all teeth.

The possibility is considered that folic acid not only fails to prevent but actually may precipitate neurologic relapse.

It is not justifiable to consider folic acid a complete substitute for extract of liver in the treatment of pernicious anemia in the light of our present knowledge.

RESECTION OF THE VAGUS NERVES IN PEPTIC ULCER

Physiologic Effects and Clinical Results, with a Report of Two Years' Experience

Boston

Perusal of the rapidly growing literature on the application of resection of the vagus nerves to the treatment of peptic ulcer makes it clear that there exist four central questions to which early answers should be obtained in order that surgeons and physicians may tentatively evaluate this surgical operation.[1] The added reservation must be made that any treatment for peptic ulcer is not put to its final clinical test until fifteen to twenty-five years have passed; short of this ultimate ideal, everything possible should be done to arrive at an early estimate of the usefulness of this new procedure.

These four questions may be stated as follows:

1. Are patients with peptic ulcer clinically benefited by this operation and, if so, what are the indications, contraindications and clinical side effects?
2. What demonstrable physiologic changes are produced in the gastrointestinal tract by resection of the vagus nerves?
3. How long do these physiologic changes persist?
4. How long do the patients remain well clinically and roentgenologically?

At present it is possible to supply answers to the first three of these four questions and a tentative answer

to the fourth. In this paper we shall attempt briefly to summarize the experience of our first two years with this procedure, especially as that experience casts some light on these four most significant problems.

The background and rationale of this surgical procedure, which stem from past physiologic research and clinical observation, have been briefly reviewed in a previous paper; the employment of this type of operative intervention in the treatment of patients with ulcer rests on these documentary evidences and also on the less well defined but equally important experience of clinical medicine, which tells us that patients with chronic peptic ulcer are apt to have exacerbations in response to certain types of environmental situations. This observation alone, wholly aside from any laboratory research, should lay a foundation for lasting interest in neurologic effects on the stomach.

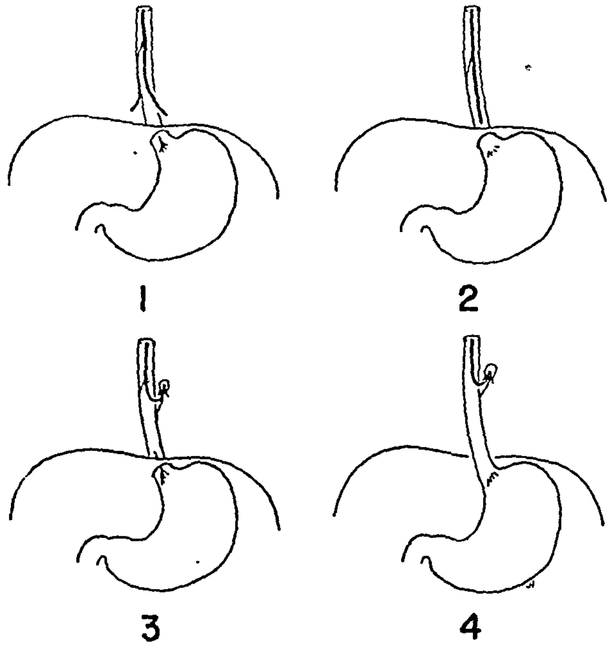

Fig 1.—Diagrammatic representation of four surgical procedures for the division of both vagus nerves at one stage: (1) supradiaphragmatic vagotomy, both nerves sectioned and pleuralized; (2) subdiaphragmatic vagotomy, both nerves cut from the abdominal approach; (3) supradiaphragmatic vagus resection, both nerves cut, portions removed and proximal ends pleuralized and encased to prevent regeneration, and (4) transdiaphragmatic vagus resection, same as (3) save for the opening of the diaphragm and the removal of the nerves down to their decussation on the stomach.

SURGICAL CONSIDERATIONS

The surgical technic of vagus resection will not be dealt with in detail here. Problems in regard to the extent of the operation and surgical nomenclature may be germane, however, to our evaluation of late results. For that reason we have diagrammed in figure 1 four possible methods of sectioning the vagus nerve supply to the stomach. In all four of these surgical procedures both nerves are sectioned at one stage. The word "vagotomy" should be reserved for those operations in which the vagus nerves are sectioned but none is removed. "Vagus resection" is a term which should be used when a section of both nerves is removed.[2] Whether the surgical intervention is transthoracic or transabdominal should be specifically stated, as well as whether or not the diaphragm has been traversed (fig. 2). It is too soon to say whether the more extensive surgical operations that we have performed (3 and 4 in fig. 1) produce a more lasting result than a more conservative procedure (1 and 2 in fig. 1).

CLASSIFICATION OF CASES

The distribution of cases in which surgical intervention was performed during the first two years of our experience with this procedure is shown in figure 3. Forty patients have had resections of their vagus nerves performed by members of the staff of this hospital. All these operations have been done through the chest of the patient, and all of them have involved resections of segments of the nerves rather than vagotomy. They all fall into operative types 3 or 4 of figure 1. In about two thirds of these cases the patients have had the diaphragm opened.

The remaining 37 patients all had peptic ulcers. Ten were jejunal or stomal ulcers, 26 were duodenal ulcers and 1 was a gastric ulcer. The 10 cases of jejunal ulcer were equally divided between those which developed after gastroduodenostomy or gastrojejunostomy and those which occurred following subtotal gastrectomy. Two of the jejunal ulcers came on subsequent to gastrectomy, which must, according to present standards, be regarded as inadequate. In 1 patient a great deal of fundus and antrum had been left proximal to the anastomosis; in the other patient the defunctioned antrum was left in, after the fashion of a Finsterer exclusion operation.

Our hesitancy to operate on patients with gastric ulcer is understandable in view of the histologic uncertainties of ulceration proximal to the pylorus. Yet when 1 patient presented himself who had previously had a duodenal ulcer and now had a gastric ulcer near a stoma established by gastroenterostomy, the gastric ulcer *being gastroscopically and roentgenologically* benign, it seemed justifiable to carry out this procedure. The gradual healing of this patient's ulcer is being followed by gastroscopy, and it should be emphasized that unless complete healing and maintenance of healing occurs further surgical intervention will be performed. *So far, his progress has been satisfactory.*

RESULTS IN CASES OF ULCER

The clinical results to date in all these patients are shown in figure 4. Of the 33 cases observed long enough postoperatively to consider as follow-ups, 7 have been followed postoperatively from one to two years and 26 have been followed from three to twelve months. Of this group of 33 patients, 32 have shown healing of their ulcer. In evaluating these cases clinically one cannot use healing of the ulcer as the only criterion of success. We have, therefore, attempted to classify our results in cases of ulcer under three clinical headings.

1. *Poor Results.*—If the ulcer did not heal and something else needed to be done, either medically or surgically, the result was classified as "poor." This was the situation in the 1 case previously mentioned, in which a defunctioned retained gastric antrum was present after a subtotal resection. In the future, patients with ulcer following subtotal resection will be dealt with according to the adequacy of their resection, inclining toward reresection if the original surgical procedure has been inadequate and performing vagus resection if

---

[2] "Vagectomy" is a misnomer, since it implies total or subtotal removal of the nerves.

the gastrectomy has been adequate according to present standards.[3]

2. *Unsatisfactory Results.*—If the ulcer healed but there were other side effects or late results which, from the point of view of the patient, rendered the resection of the vagus nerves of dubious value to him, the results were regarded as "unsatisfactory." There were 3 such patients, in all of whom the ulcers healed. One of these patients came in originally with some obstructive symptoms which disappeared on conservative therapy and postoperatively, over the course of nine months, stenosed his duodenum completely. With no demonstrable recrudescence of his ulcer this patient required a larger opening to his stomach than the stenosed duodenum. For this reason a posterior gastroenterostomy was performed. It is difficult to know in which group to classify this result until we have had more experience, but for the present it must be regarded as short of perfect. Two of the patients have continued to have abdominal pain. These are the 2 patients shown in figure 3 under the category of psychiatric. They were both patients whose abdominal symptoms were not transiently relieved by the use of alkali compounds. They both had a psychiatric background, and although their ulcers have now healed they still have abdominal symptoms, in 1 case made worse by the surgical operation.

3. *Satisfactory Results.*—Twenty-nine of the 32 patients with healed ulcers show results which are, from the clinical point of view, satisfactory. Twenty-three of the 29 patients have been asymptomatic. Five patients have had gastrointestinal symptoms which, though transient, have been a factor detracting from the early postoperative satisfaction of the patient. Three of these 5 patients had diarrhea which lasted from three to five months after the surgical intervention and amounting to three to five bowel movements a day. At times this diarrhea caused much inconvenience, but at no time has it produced nutritional difficulties or dehydration. In all cases it has ceased spontaneously.

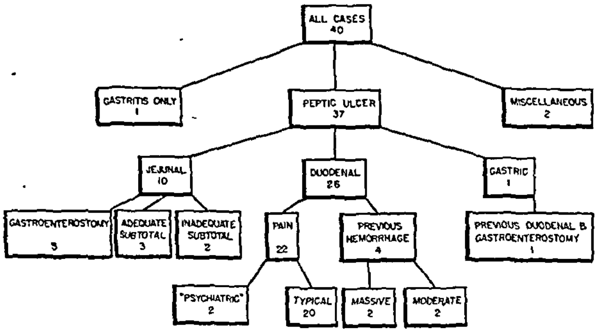

Fig. 3.—Classification of 40 cases treated by vagus resection over a two year period, Aug. 1, 1944 to June 15, 1946 at the Massachusetts General Hospital.

Two of the patients had symptoms after eating, either of fulness or of epigastric pressure and faintness. These postprandial symptoms have likewise decreased with the passage of time, and 4 of the 5 patients in this group regard their operation as having been successful. The fifth, while clear of disease roentgenologically, is now, two years postoperatively, again taking antacids and milk for "ulcer pain." The further course of this patient will be of the greatest importance in our ultimate conclusions.

The patients with jejunal ulcer have done well clinically. One patient (jejunal ulcer following posterior gastroenterostomy) has had postprandial symptoms similar to those following a subtotal resection; he has feelings of weakness and dizziness after eating and feels a desire to lie down. These sensations are decreasing; the jejunal ulcer is healed, and the patient's nutrition is adequate.

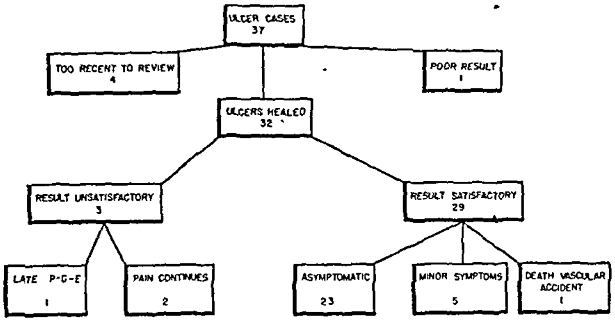

Fig. 4.—Results three to twenty-two months postoperatively in the 37 cases of peptic ulcer (fig. 3) treated by vagus resection. In lower left corner: P. G. E., posterior gastroenterostomy.

One patient died of a cerebrovascular accident nine months postoperatively, the vascular accident being the result of hypertension. The patient was not thought suitable for splanchnic resection, and the vagus resection was successful as far as healing of the patient's ulcer was concerned. This late fatality from a complication of hypertension, however, raises the possibility that vagal interruption renders hypertension more rapidly progressive. If there is an antagonistic balance between the splanchnic and the parasympathetic supply to the viscera, it is conceivable that removing the parasympathetic "brake" allows the sympathetic system to overact uncontrolledly.[4]

Our analysis of these results which were short of perfect may appear to place undue stress on a few patients. The great majority of patients (91 per cent) have been well pleased with the results and have thrown off the shackles of diet and repeated office or hospital medical care for the first time in many years. Yet at this early stage in our experience with a new procedure a detailed consideration of less perfect results may teach us more than many reiterations of the advantages to be gained.

INDICATIONS

From these data as well as from a complete study of the clinical histories, which cannot be included here for reasons of length, we can form several conclusions about the type of patients most benefited by this operation.

Group 1.—In group 1 are patients with previous gastric surgical intervention in which a new outlet to the stomach has been made and in whom renewed ulceration is present. In this group of patients side effects from resection of the vagus nerves have been the fewest, results have been satisfactory and the technical contrast between vagus resection and renewed approach through the abdomen is most striking. Inadequate gastrectomy is much less favorable than gastroenterostomy as a background for resection of the vagus nerves, and this fact should be taken into consideration in selecting patients for operation. If vagus resection should ultimately fail, its failure will first become manifest in this group of patients because of the strong tendency to recur which is found in jejunal ulceration.

[4] Three cases have been brought to our attention which may illustrate the converse of this relationship. All 3 patients had had splanchnic resections for hypertension and subsequently bled massively and painlessly from duodenal ulcers. One patient succumbed to the hemorrhage. From these events one would conclude that resection of the splanchnic nerves should be approached with added caution in the presence of an active duodenal ulcer, and that vagus resection should similarly be undertaken with caution in the presence of hypertension.

Group 2.—The patients in group 2 are those with painful duodenal ulcer coming on during periods of environmental stress, the pain being transiently relieved by antacid preparations and the patient being of intelligent, nonpsychiatric background. This group is in sharp contrast to the psychiatric group of patients with ulcer in whom surgical intervention should be avoided. This favorable group includes many patients who are wage earners, who are taking care of a family or who are busy in a useful position in society. Among the best results which have been obtained have been those in the group of private patients whose intelligence and insight into their problem has been most striking.

Group 3.—In group 3 are patients whose ulcer has not been notable for the symptoms produced, but which has produced hemorrhage or perforation in the past and which has been clearly demonstrable roentgenologically. The chief danger in carrying out resection of the vagus nerves on the "painless bleeder" is the hazard that one may operate on a patient who is bleeding from esophageal varices, a Meckel's diverticulum or other gastrointestinal pathologic structure. If the bleeding is from an ulcer vagus resection will, in our experience, heal the ulcer, and there is nothing irrational about carrying out the procedure. In the patient with painless bleeding the problem is not one of physiology but one of clinical diagnosis.

CONTRAINDICATIONS

It is possible to make a tentative statement as to the type of patient who is not improved by this operation.

Group 4.—This group includes patients with disturbed psychiatric background who are psychoneurotic or frankly psychotic, with multifarious symptoms, most of which are unrelieved by antacid preparations and only a small fraction of which are related to the ulcer. This type of patient will react poorly to surgical intervention. The difficulties of gastric emptying, instead of being accepted as a transient result, will be seized on as evidence of failure; one must avoid the error of concluding that because the patient is psychiatric the disorder in the stomach must be psychogenic and therefore susceptible to relief by resection of the vagus nerves.

It is important to emphasize here that vagus resection is not a cure-all for abdominal pains. No demonstrable sensory fibers reaching a conscious level are sectioned, and as far as the relief of pain is concerned the operation is of great specificity, relieving pain only when it is due to peptic ulcer.

Group 5.—Patients who are acutely bleeding are included in group 5.

Group 6.—Patients with frank cicatricial obstruction constitute group 6. A two stage procedure may be worked out for these patients which will be satisfactory. Dragstedt has described a one stage subdiaphragmatic vagotomy and posterior gastroenterostomy. There are two theoretic objections to this procedure. First, that in a patient with advanced obstruction, dilatation of the stomach may be produced by vagus resection which would be extremely difficult to control despite gastroenterostomy. Second, by a subdiaphragmatic vagotomy one cannot remove as much nerve as would seem desirable. Were a frankly obstructed patient to exhibit a clinical picture suggesting that his ulcer activity would react well to vagus resection, we would consider that it was rational to decompress his stomach first by means of a posterior gastroenterostomy and to follow this with an adequate transthoracic resection of the vagus nerves as a separate procedure. The passage of further time alone will tell us whether or not this combination has anything to recommend it over subtotal gastrectomy.

ORGANIC CHANGES

Examples of secretory and motility alterations produced by vagus resection have been shown in a previous publication. The follow-up secretory studies on 6 patients are shown in the accompanying table, in which the number of observations on a given date is shown, with the range of values and the averages.

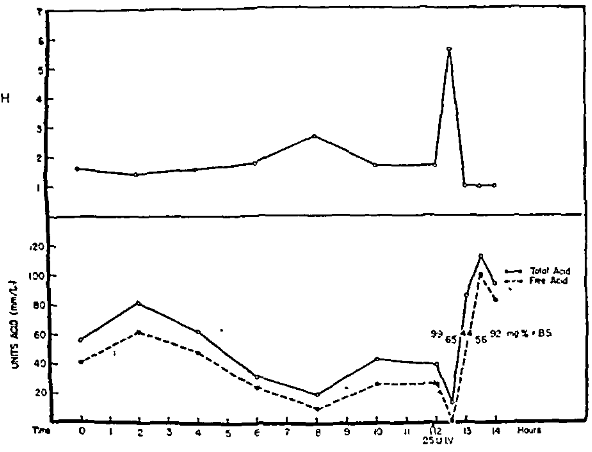

Fig. 5.—H. W.: Serial determinations of overnight secretion (starting at 8:00 p. m.) in a patient with a healed duodenal ulcer, posterior gastroenterostomy and active gastric ulcer.

Preoperatively the overnight secretion is only moderately acidic. There is a typical biphasic response to insulin (administration of 25 units intravenously shown by arrow) with initially an alkaline and at one hour a decidedly acid secretion.

Increases in the p_H value and lowering of free acidity are consistent and usually maintained to some extent, though not at the level obtained in the first postoperative observation. Pepsin[7] changes are inconstant;[8] the total chloride content, like acidity, may fall. The total base concentration may rise, but the changes are not wholly consistent.

Figures 5 to 9 demonstrate secretory alterations in response to insulin hypoglycemia.

The gastric response to insulin-induced hypoglycemia has been worked out by Weinstein and his associates[9] as a standard test and is going to be an extremely reliable and important observation to carry out on these patients. It should be done in the morning on a fasting stomach and, if the patient is postoperative, the stomach should be emptied before the test is begun. We have found that 20 to 25 units of insulin should be administered intravenously, in accordance with the weight of the patient, using the larger dose for men who weigh over 150 pounds (68 Kg.). Multiple samples of blood for sugar determination and multiple gastric samples can be taken, although the blood sugar and gastric sample one hour after the administration of insulin will usually yield the desired information when compared with the preinsulin level.

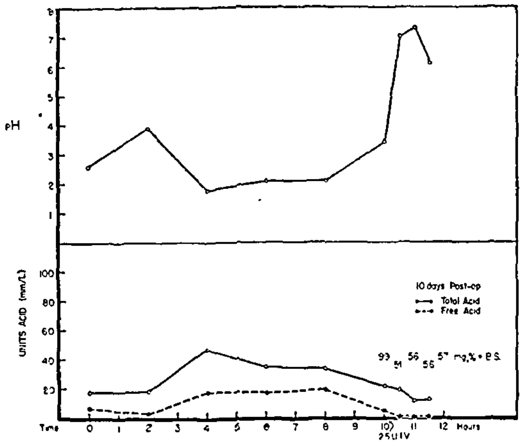

Fig. 6.—H. W.: Ten days postoperatively there is less acidity overnight, and the response to insulin is monophasic, producing only an alkaline secretion.

In our experience resection of the vagus nerves has uniformly abolished the acid response to insulin-induced hypoglycemia in the early postoperative phase.[9a]

The importance of these demonstrable organic changes in the stomach after following vagus resection hinges largely not on their description or extent but rather on their duration. Approximately one year after our first patient was operated on, we began to obtain evidence that local physiologic changes in the resting unstimulated stomach tended to return to normal: Now

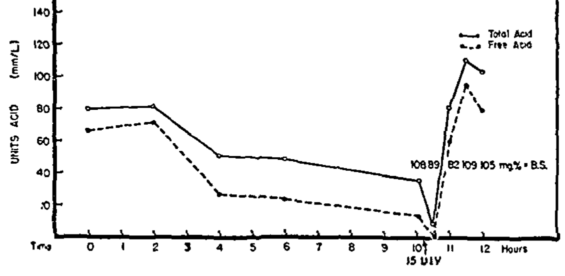

Fig. 7.—S. D.: Preoperative serial determinations of gastric acidity overnight (starting at 8:00 p. m.) and in response to insulin-induced hypoglycemia.

[7] Anson, M. L., and Mirsky, A. E.: Estimation of Pepsin with Hemoglobin, J. Gen. Physiol. **16**: 59-63, 1932.

[8] Pepsin assays have been done uniformly on 1 cc. of gastric juice which is undiluted. This avoids the possible errors traceable to dilution as pointed out by Bucher, G. R.; Grossman, M. I., and Ivy, A. C.: A Pepsin Method: The Role of Dilution in the Determination of Peptic Activity, Gastroenterology **5**: 501-511, 1945.

[9] Weinstein, V. A.; Colp, R.; Hollander, F., and Jemerin, E. E.: Vagotomy in Therapy of Peptic Ulcer, Surg., Gynec. & Obst. **79**: 297-305, 1944.

[9a] Recent experience has shown the insulin test to be a less reliable test than this would indicate. Serial tests have shown variations in the same patients.

we can state without reservation that gastric motility as recorded in the resting state by the kymograph may return to normal or nearly normal levels by the end of one year. Gastric atony seen at fluoroscopic examination is gone in three to nine months, although some delay in pyloric emptying may persist. Secretory changes, as tested by multiple quantitative determinations of the overnight gastric secretion, tend to return toward the normal range over a period of six to twelve months, although some reduction in acidity and an increased p_H value may persist. The response to insulin-induced hypoglycemia, however, has remained abolished in all our patients except one, who is worth discussing in some detail. He was the fourth patient on whom resection of the vagus nerves was performed at this hospital. He had an extremely intractable duodenal ulcer of eighteen years' duration, and his clinical result has been eminently satisfactory and has remained so despite secretory and motility findings which are in the normal range. When he was given a dose of insulin, which produced severe systemic symptoms and a blood sugar level of 33 mg. per hundred cubic centimeters, excessive sweating, excessive salivation, abdominal discomfort and massive gastric secretion were produced (fig. 9). The question arises as to how this severe hypoglycemia affects the stomach and whether this is a different phenomenon from the gastric stimulus produced by blood sugar levels in the vicinity of 50 to 70 mg. per hundred cubic centimeters. In all our preoperative insulin tests we have found a better correlation between the patient's symptoms and his gastric response than between his blood sugar levels and his gastric response, presumably because persons vary in their sensitivity to hypoglycemia. On this basis the systemic symptoms experienced by this patient were severer than any others we have produced and his gastric secretion showed a definite response despite the continued good clinical results following vagal interruption.

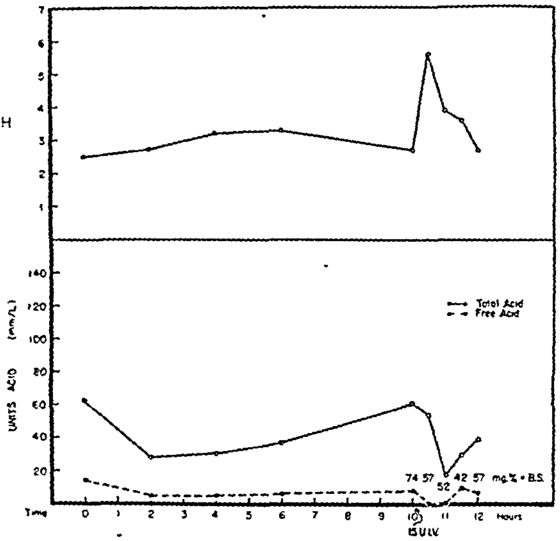

Fig 8—S D As in H W (figs 5 and 6), this patient with a longstanding duodenal ulcer shows diminution in resting acidity and abolition of an acid secretory response to insulin thirteen days postoperatively as compared with preoperatively (fig 7). The preoperative hypoglycemia produces a biphasic gastric response as in H. W. Postoperatively only an alkaline response is produced.

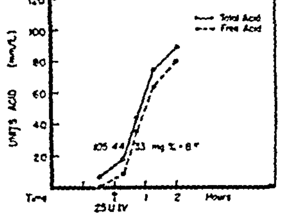

Fig. 9—G. B: Postoperative secretory response to insulin-induced hypoglycemia eighteen months after vagus resection for duodenal ulcer. A large dose of insulin produced excessive systemic symptoms and a blood sugar value of 33 mg. per hundred cubic centimeters A decidedly acid secretory response is obtained despite continued evidence of vagal severance by the criteria of clinical well being and resting acidity.

This patient brings out another point about vagal surgery which may transcend in importance all the laboratory data we have obtained. This patient is a tall, thin, lanky man, a worrier with a typical ulcer habitus. He states that prior to his operation any sort of difficulty at home or in his business caused him to have symptoms in his stomach. Since surgical intervention he has not observed that correlation, and even during the illness of his wife, an event which preoperatively would have produced an exacerbation of his ulcer, he has had no difficulty whatsoever. This cortical-gastric disconnection has been maintained, and even at the time when he showed an acidity response to a blood sugar determination of 33 mg. per hundred cubic centimeters he still manifested an excellent symptomatic result.

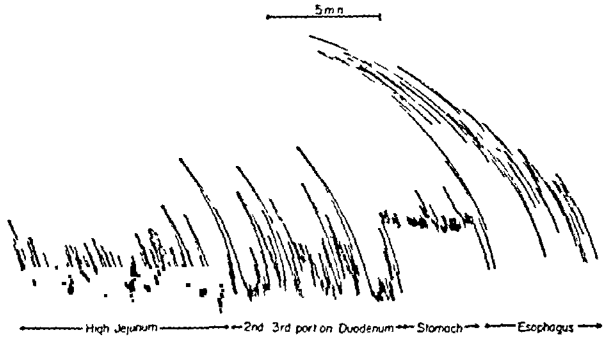

Fig 14—Preoperative balloon kymographs of motility in the upper gastrointestinal tract of patient A H

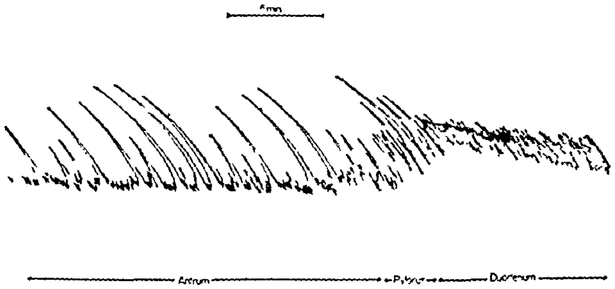

Fig 15—Same as figure 14. A clear depiction of the alteration in motility as the balloon passes through the pylorus is seen This patient had a duodenal ulcer. There is no striking abnormality to be seen in these tracings.

Physiologic changes observed by kymograph after vagus resection are shown in figures 10 to 23. Kymographic tracings must be made with special care with reference to three features: accurate fluoroscopic control, prolonged observation and recognition of the stimulus produced by intragastric balloons of varying dimensions. The "quiet stomach" of a postoperative patient can often be stimulated into pronounced activity by a sudden increase in the size of the balloon. In addition to the types of observations shown in these figures we have studied the lower ileum (by ileostomy) and rectum. Motor changes beyond the pylorus are transient and ill defined.

It should be emphasized again that the threshold of pain to balloon distention in esophagus, stomach, duodenum and small bowel is unchanged by this operation. Nausea, vomiting, appetite, hunger, anorexia, fulness and crampy gastric pain may all be experienced by patients subsequent to resection of the vagus nerves.

COMMENT

The data presented herein might be summarized in the form of answers to the various questions which were posed at the outset.

1. *Are patients clinically benefited by this surgical procedure, and if so what are the indications and contraindications?*—In the patients operated on thus far the ulcers have healed with great uniformity. At the present time there can be no doubt that vagus resection offers a potent and effective means of dealing with peptic ulcer. The patient who most consistently and characteristically is benefited is that patient who most closely approximates the "typical ulcer case" and who, at the same time, does not have frank psychiatric or psychoneurotic symptomatology. This should not be interpreted as meaning that resection of the vagus nerves is contraindicated in all other types of patients. It is simply a statement of our experience in regard to the type of patient whose clinical result is most reliable. If the patient has had previous surgical intervention there is, in a sense, an added indication, though the basic problem remains the same. Clinical side effects are not negligible but rarely detract from the result.

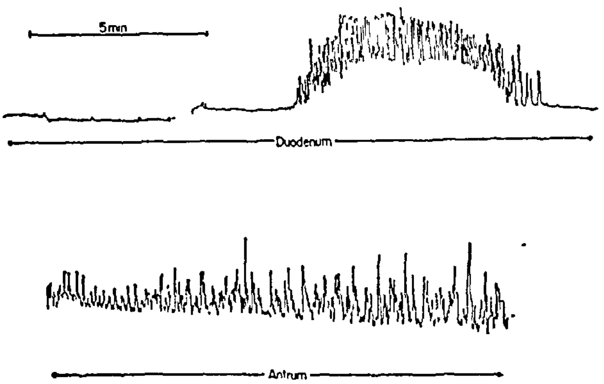

Fig. 16.—Postoperative balloon kymographs of motility in the upper gastrointestinal tract of patient A. H., six months after vagus resection As compared with figures 14 and 15, there are periods of prolonged quiescence in both duodenum and antrum. In both cases, with no apparent stimulus, considerable motor activity arises and then ceases spontaneously. It is apparent from such results that isolated short observations are of little value or significance.

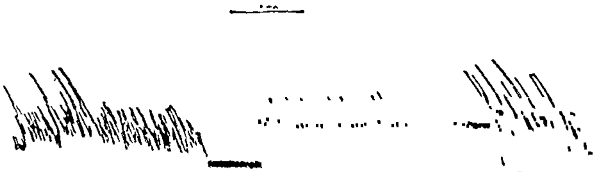

Fig 18—Preoperative balloon kymograph of motility in the upper gastrointestinal tract of patient W. M. There is no abnormality clearly demonstrable. This tracing shows a short period of quiescent antrum, followed by activity in response to an additional quantity of air in the balloon.

2. *What demonstrable physiologic changes are produced in the gastrointestinal tract by vagus resection?*—A decrease in motility and acidity with no change in sensation is the typical postoperative picture in the resting unstimulated stomach of patients who have had resection of the vagus nerves. Nausea, vomiting and epigastric sensations of fulness may still be experienced, and there is no change in the sensory threshold to balloon distention of the esophagus, stomach, duodenum, jejunum and ileum. Changes in motility beyond the pylorus are transient, ill defined and inconstant. Secretory and motility responses to stimuli mediated over the vagus nerves are the most important type of observation to be made postoperatively in these patients. At the present time the insulin test is the most reliable such stimulus. It is conceivable that dextrose or metrazol may give pancreatic responses mediated over the vagi which will be equally good tests for vagal division.[10] The final criteria in this field, however, rest partly in the psychiatric realm, as it is the patient's organic response to certain types of environmental stimuli which seem to determine his clinical result. At the moment we do not have a reliable way of producing these stimuli in patients, though such methods may be developed by future research.

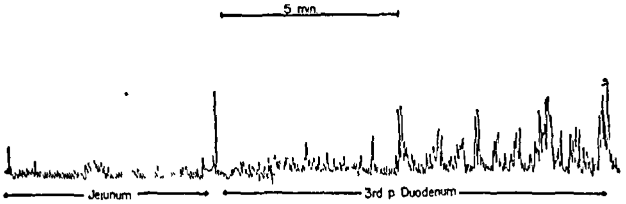

Fig. 20—Postoperative balloon kymograph of motility in the upper gastrointestinal tract of patient W. M. four months after vagus resection.

3. *How long do these physiologic changes persist?*—In our experience demonstrable changes at the organic level in the resting unstimulated stomach have for the most part disappeared by the end of one year. Evidence that section of the vagus nerves still persists is to be found in the continued abolition of secretory response to hypoglycemia in most of the patients. The continued clinical results as well as the postmortem data from 1 patient also indicate that regeneration of the nerves has not taken place after use of the operative procedure as performed in this hospital. We may, therefore, conclude that the return to normal resting function is an evidence of gastric autonomy and that effective severence of the main neural pathways between brain and stomach still persist.

4. *How long do the patients remain well?*—We can only answer this question to the extent of our two years' experience. In that time our patients have remained well, and their clinical results appear to outlast the duration of those organic changes which we have studied in the resting stomach. One patient who two years postoperatively finds that it is necessary to

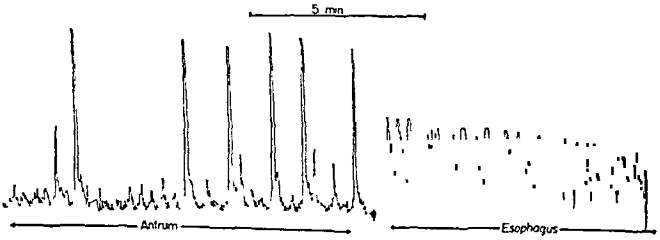

Fig 21—Same as figure 20 The esophagus and small bowel show activity similar to that seen in figures 18 and 19 The gastric antrum has regained its tone and produces high peristaltic waves.

---

[10] Gellhorn, E: Autonomic Regulations, New York, Interscience Publishers, Inc, 1943.

take milk or antacid to relieve epigastric discomfort despite the absence of a demonstrable ulcer raises interesting questions about the ultimate fate of these patients, questions which can have no final answer at the present time.

To be effective and take a permanent place in the field of therapeutics a treatment of peptic ulcer must be lasting and devoid of undesirable side effects. This surgical procedure appears to be effective, and within the limits of our knowledge it is lasting. Its undesirable side effects, while present, do not occur in more than a minority of patients and are not a major consideration. To most patients its side effects are not in any degree comparable to their preoperative difficulties.

SUMMARY

The clinical and laboratory data in a group of patients operated on for peptic ulcer over a period of two years by resection of the vagus nerves are presented.

Clinical results are good; healing of the ulcer is the most uniform feature of the series; recurrences have not been encountered; transient undesirable side effects do occur and are found in about 10 per cent of the patients.

The early decrease in fasting acidity and motility, which is so readily demonstrable after this operation, gradually returns toward normal until, at the end of a year, little abnormality can be found by these criteria. The secretory response to insulin-induced hypoglycemia remains abolished in most cases, and the clinical well-being of the patients also appears to outlast the duration of the early secretory and motility changes.

This suggests strongly that although the immediate relief of pain and healing of the ulcer which are observed after vagus resection may be due to changes in fasting motility or secretion produced by that operation these resting changes are relatively transient, and any prolonged relief which this surgical procedure confers on the patient is due to some more subtle effect.

This more subtle effect is probably traceable to severance of those nervous pathways which communicate the patient's adaptive reactions from brain to stomach. In patients suffering from peptic ulcer impulses transmitted over these pathways in response to environmental situations often result in exacerbation of their disease. After resection of the vagus nerves such impulses cannot reach the stomach and exacerbations of ulcer have not occurred.

ABSTRACT OF DISCUSSION

Dr. Leland S. McKittrick, Boston: I have never performed this operation, but I am here because of my interest in the problem of peptic ulcer and because of the privilege that has been mine in following the work of Dr. Moore and his co-workers at the Massachusetts General Hospital. If we as surgeons are realistic about our approach to peptic ulcer, we must admit that the best we have to offer leaves a great deal to be desired. It is completely unphysiologic to remove a large portion of a person's stomach for the treatment of an ulcer of the duodenum. It is also a destructive procedure. The results obtained are not too satisfactory. The mortality is low in experienced hands and the incidence of recurrent jejunal ulcer is not large; but there is a sizable group of patients (I don't know just how many, but I suspect it comprises from 10 to 15 per cent) in which the side products of the surgical operation are distressing and at times extremely disabling. I am referring now not only to the so-called "dumping" syndrome but particularly to that group of patients who fail to gain in weight and strength and therefore lack the ability to be completely rehabilitated. Nevertheless, the procedure of choice for the majority of intractable duodenal ulcers is an adequate subtotal resection. On the other hand groups like Dr. Moore and his co-workers, Dragstedt and others, should be encouraged to continue with their careful, painstaking studies of this problem even though vagus resection is far from the point where it can be accepted as the treatment in all cases. There are, however, several points that are justified. It is a more truly physiologic approach to this problem and it is safe in experienced hands. Not to be overlooked is the fact that if it fails, there is nothing which makes it impossible to do a subtotal resection or which even complicates the carrying out of that procedure. In the doing of our subtotal resections we must continue to perform a really adequate operation if we expect vagus resection to be successful in the treatment of the occasional jejunal ulcer we may encounter. It is of interest that in the patients of Dr. Moore where the antral mucosa has been left in or where an inadequate subtotal resection has been done the response to this surgical procedure is not satisfactory.

Dr. William DeW. Andrus, New York: There entered the surgical service of the New York Hospital a couple of months ago a man who by roentgen examination had an extensive carcinoma of the midportion of his esophagus, extending above the arch. In order to make some direct studies on gastric secretion a preliminary gastrostomy was performed. Through that gastrostomy, Dr. Stewart Wolf who, with Dr. Harold Wolff, has done extensive studies on gastric physiology, with particular reference to the effects of emotion, then conducted a long series of studies over a period of about two weeks, after the gastrostomy of the patient had healed. His chest was then explored and it was found that because of fixations to the aorta and other structures it was impossible to remove the tumor. At that operation, however, a resection of the vagus nerves was carried out, and after he had recovered from that procedure the previous studies were repeated. They confirmed practically entirely those that Dr Moore has commented on, with the exception of the effects on acidity; this patient had complete anacidity. However, the striking effect on which I wish to comment was that before surgical intervention, under direct vision, it was possible to observe that emotion, particularly resentment, would bring about a pronounced vascular response in his stomach, which could be measured on a color scale; following operation with resection of the vagi resentment and anger, though they caused flushing of the face and other evidences of emotional response, failed to produce any color changes in the mucous membrane of his stomach. Thus in a single case, carefully studied, direct evidence has been obtained of interruption of a well defined vascular response to emotion, after the resection of the vagus nerves. This procedure may be a more physiologic attack in that it may interrupt a basic etiologic factor in the production of ulcer.

Dr. Dewey Tuttle, Houston, Texas: We have done a few of these operations in Houston. Chiassi, an Italian surgeon, showed in 1925 that even beneath the diaphragm enough of the vagus nerve could be resected to lessen the probability of recurring marginal ulcers, but Dr. Moore's sections and his diagrams show the implausibility of approaching the vagus nerve below the diaphragm. Dr. Moore has gone even further than Dr. Dragstedt and the group at Duke, and to make sure that he is getting the vagus nerve he has shown you the second type or the last two types of the more radical approach to the esophagus. In our work, we felt we had been getting the vagus nerve because of the response to the hyperinsulism, which has proved that we get the same curve as in Dr. Moore's tracing. We have had only 5 of these cases that we can follow to date, but every one of the patients has shown improvement; there have been no bad results and no mortality. Dr. Moore has pointed out that this work is in its infancy and that his are preliminary studies. Resection of the vagus nerves has been performed on a large group, relatively speaking, and attention should be paid to the one note of warning that he does sound. This operation must be approached with precaution. Horsley pointed out that hypermotility, hypersecretion and hypertonus play no little part in the formation of ulcer. Every one of these patients is immediately improved in each of these categories. We are having a little trouble in our postoperative study, in convincing the medical practitioners in our part of the country that there is something here to offer for the relief of the peptic ulcer sufferer, that is, the decided dilatation of the stomach with delayed emptying time. It is peculiar that the total acid determinations in our group of patients have shown no essential change. The total acids usually play little part in causing distress in these persons. The University of Chicago group are showing impressive results in a new approach below the diaphragm and short circuiting by a gastrojejunostomy. Surely there is some phase of vagus resection that can be used.

DR. FRANCIS D. MOORE, Boston: In regard to Dr. McKittrick's mention of the "dumping" syndrome and failure to gain weight, I should mention that we had 1 patient in whom, after vagal resection, there developed a characteristic "dumping" syndrome, similar in every way to that following subtotal gastrectomy. However, these symptoms went away in approximately eight weeks, and he is now well and gaining weight. The chief interest attaching to this incident is the fact that the sensory arc of the "dumping" syndrome is evidently not carried over the vagi. Dr. Andrus has told of a most interesting patient in whom mucosal changes could be followed through a gastrostomy after resection of the vagus nerves. This is most fascinating to me, and I believe it represents the real frontier in the ulcer problem. I wish we had some way of studying our patients' gastric response to emotion before and after this operation because it is really the most important single aspect of vagal surgery. We are trying to get at it with the collaboration of our psychiatric service. Drs. Wolf and Wolff in New York, of course, have done a tremendous amount of work in that field and have a wonderful background to pursue it further. As far as subdiaphragmatic section of the vagus nerves is concerned, I have felt that it is inadvisable because one could not remove as much nerve or do as much to prevent regeneration as is possible through the chest. However, I must point out that we have had little experience with the subdiaphragmatic maneuver and that we must give it a more adequate trial before making any dogmatic statements.

Autobiography of Cardano.—It is indeed appropriate that the first full dress medical autobiography should be that of Girolamo Cardano, for in the pitiless self scrutiny of this Renaissance doctor are to be found many, if not all, the elements that characterize autobiography in general and medical autobiography in particular. Cardano was one of the strangest figures of the sixteenth century, in the first year of which he was born. Well known is Boerhaave's remark on Cardano that "no one was wiser when he was wise; nobody was more foolish when he erred." Hegel described him strikingly as "a world famous individual in whom the dissolution and ferment of his time are manifested in a most extreme form." Goethe likewise regarded him as a typical representative of Renaissance individualism and expressed the following judgment: "Cardanus everywhere regards science in relation to himself, his personality and his life history, with the result that his works are characterized by a naturalness and vitality which attracts and refreshes, and stimulates us to activity. He is not a doctor in a long robe who imparts instruction to us *ex cathedra* but rather a man who goes about, observes and is astonished by what he sees, experiences pain and joy, and passionately thrusts upon us an account of all this."—Caspari-Rosen Beate, and Rosen, George: Autobiography in Medicine, *J. History Med.*, April 1946.

THE TREATMENT OF ACUTE GOLD AND ARSENIC POISONING

Use of BAL (2,3-Dimercaptopropanol, British Anti-Lewisite)

ABRAHAM COHEN, M.D.
Philadelphia
JOEL GOLDMAN, M.D.
Lewistown, Pa.
and
ALFRED W. DUBBS, M.D.
Allentown, Pa.

The treatment of acute poisoning due to gold and arsenic compounds with BAL (2,3-dimercaptopropanol, British Anti-Lewisite), has given successful results.

Although gold has been acclaimed the best single therapeutic substance in the treatment of rheumatoid arthritis,[1] its use heretofore has been limited largely to a few rheumatologists and clinics having wide experience in chrysotherapy. This rather strict limitation of the use of gold is due to the occasional unpredictable and devastating symptoms of toxicity that appear when gold products are administered by inexperienced physicians. In our series of approximately 750 courses of gold injections,[2] the untoward reactions which were encountered, largely in our earlier use of gold, included generalized pruritus, seborrheic dermatitis, urticaria, purpura, secondary anemia, exfoliative dermatitis, stomatitis, thrombopenic purpura, agranulocytosis, jaundice, gastroenteritis and conjunctivitis. Among additional toxic manifestations reported by others are peripheral neuritis, dizziness, nausea, vomiting, nephritis and acute yellow atrophy of the liver. Toxic reactions are stated to occur in 20 to 56 per cent of cases, but with proper precaution this incidence may be materially reduced. The patient must be instructed to be on the alert for itching of the skin, rash and soreness of the mouth. The physician should limit the weekly dosage to 50 mg. and the total dosage of the course to about 765 mg. and should make periodic examinations of the blood. Gold should not be used in the treatment of patients with severe diabetes, nephritis, hepatitis, decided hypertension or hemorrhagic diathesis.

However, in spite of all possible precautions on the part of the patient and physician, occasional sensitivity to gold is encountered which may result in extremely severe toxic manifestations, probably the most distressing of which is exfoliative dermatitis. Search, therefore, has been made during the two decades since the introduction of gold therapy by Forestier [3] for an effective antidote to poisoning due to this metal. During the war research groups in England and the United States developed, under strict secrecy, an effective antidote against acute arsenical poisoning, notably that caused by lewisite. With the lifting of security restrictions and the publication of the extensive researches in this field by the two governments, BAL (2,3-dimercaptopropanol) became available for general use. Although during the war there was fortunately no opportunity for using this substance as an antidote to lewisite or related arsenic-containing substances designed for chemical warfare, valuable applications of it were made to the treatment of toxic reactions due to arsenic therapy of

syphilis.[4] This drug was soon shown to be effective also as an antidote in acute poisoning due to mercury,[5] cadmium,[5a] zinc[6] and copper.[7] The logical extension of these studies is the employment of BAL as an antidote to acute poisoning caused by gold in the course of chrysotherapy. No previous publication on this use of BAL has come to our attention.

Now generally accepted is the hypothesis that heavy metals[8] such as arsenic and mercury exert toxic effects on biologic systems by reacting with sulfhydryl groups of the protein fraction of cellular enzymes to form mercaptides. Arsenic and gold are closely related chemically in regard to valencies and inorganic reactions. It may therefore be presumed that their biochemical reactions are similar and that BAL is able to reverse the toxic effects of gold, as it has been shown to do in the case of arsenic. It may be presumed that toxic reactions from gold are due to its combination with sulfhydryl groups in stable compounds in tissues, and that sulfhydryl groups in the dithiol BAL compete effectively with these dithiol protein-metal compounds in the tissues, thus eliminating the offending gold, relieving the biochemical lesion and restoring the normal enzyme systems by a mechanism parallel to that concerned in the BAL therapy of arsenic poisoning. Although the preliminary studies reported here are not confirmed by laboratory studies of gold toxicity in animals or by gold excretion studies, the clinical results indicate a close similarity between the effects of BAL in toxic reactions to gold and arsenic. Results of attempted laboratory confirmation of these presumptions will be published.

On account of our strict prophylactic regimen, no opportunity for a study of BAL has presented itself among cases in which gold therapy was initiated by us. However, in the few months that BAL has been available we have had 5 referred cases of acute gold toxicity and 1 of arsenic toxicity which we have treated with this new antidote. Results of therapy in all cases were most gratifying, in that there was prompt and complete reversal of all toxic manifestations. Almost dramatic was the disappearance of cutaneous lesions, including severe exfoliative dermatitis.

Unfortunately, BAL is not an entirely ideal antidote for poisoning by the heavy metals because it has toxicity of its own. Among its toxic effects are malaise, nausea, vomiting, salivation, lacrimation, paresthesia, perspiration, sense of warmth and, most commonly, pain in legs, arms, abdomen and head. Acceleration of the pulse and increase in the systolic and diastolic blood pressures are frequently observed. In the antidotal use of BAL these toxic symptoms are usually transient, disappearing in a few hours at most, and may be disregarded in view of the resultant benefit.

The product used in this study was a 10 per cent solution of BAL in peanut oil with 20 per cent benzyl benzoate[9] at the suggestion of Dr. Harry Eagle, Director of the United States Public Health Service Venereal Disease Research and Postgraduate Training Center, Johns Hopkins Hospital. It is hoped that similar studies with BAL glucoside[10] or other less toxic derivatives for intravenous use will eliminate the fear of the use of gold in the treatment of rheumatoid arthritis and permit its more general use in relieving this widespread condition.

REPORT OF CASES

CASE 1.—G. W., a white man aged 20, had oxophenarsine hydrochloride therapy initiated March 6, 1946, with 40 mg. of the drug given intravenously. This dosage was repeated March 8, 11, 13, 15 and 18, for a total of six 40 mg. doses, the last dose being overlapped with an intramuscular injection of a bismuth preparation. During the evening of March 18 chills, fever, nausea and vomiting developed, but the patient did not report to his physician. On March 19 a purplish, papular, pruritic rash developed. Another injection of a bismuth preparation was given intramuscularly on March 20, and 1 Gm. sodium thiosulfate and 3 minims (0.18 cc.) epinephrine were administered intravenously. He felt well until the afternoon of March 21, when he had a convulsion and lapsed into a coma. There had been no previous episode of convulsions or loss of consciousness.

On March 22 the patient was brought to Philadelphia General Hospital in a comatose state, and BAL therapy was initiated by the intramuscular injection of 2 cc. of a 10 per cent solution of the drug in oil with 20 per cent benzyl benzoate every four hours for seven doses, or a total of 14 cc. On March 23 a total of 8 cc. was given, 2 cc. every six hours for four doses. The patient remained comatose during the first twenty-four hours of therapy. Thirty-six hours after admission signs of pulmonary edema were manifest. It is not probable that this was due to BAL toxicity. Vigorous therapy with positive pressure oxygen, intravenous hypertonic dextrose and spinal puncture was instituted. The pressure of the spinal fluid was 420 mm. of water. After the spinal puncture respiration became less labored, and by midnight of March 23 there was no respiratory embarrassment. Massive doses of vitamin K were given because of a 50 per cent prothrombin level. Concurrently, large doses of parenteral ascorbic acid and calcium gluconate were given because of the purpuric rash and other purpuric phenomena elicited by the application of the sphygmomanometer cuff.

By March 24 the patient was conscious, answered questions intelligently and appeared to be recovering. Therapy was continued with BAL (2 cc. every six hours for three doses), calcium gluconate, vitamin K and ascorbic acid. On March 25 the dosage of BAL was 2 cc. every six hours for three doses; from March 26 to 31 the dosage was 2 cc. twice a day. During this time the purpura disappeared, the only residual symptoms being a positive Chaddock's sign on the right side and some continuing hepatic damage, as evidenced by 49 per cent blood prothrombin concentration with cephalin-cholesterol flocculation in forty-eight hours. This was a typical case of severe arsenical reaction, which presumably would have terminated in death but for the prompt use of this new antidote.

CASE 2.—J. J., a Negro woman aged 63, had previous to hospital admission been given 7,900 mg. of aurothioglycolanilide (Lauron, Endo Products, Inc.), an insoluble gold preparation. One month after discontinuing these injections, the patient noted the development of a dermatitis around the right ear which soon spread to involve the entire right side of the neck, continuing around the neck to the left side and including the skin around the left ear. Similar lesions developed beneath the breasts and under the arms. The dermatitis was pruritic, scaly and fissuring. There was oozing, and the margins of the lesions were extremely erythematous but not indurated. There was practically no limitation of motion in the joints.

[10] Danielli, J. F.; Danielli, M.; Mitchell, P. D.; Owen, L. N., and Shaw, G.: Development of a Chemotherapy for Systemic Arsenical Poisoning, Nature, London **157:** 217 (Feb. 23) 1946.

On March 15, 1946, ten minutes after the fifth injection of BAL (2 cc. of the 10 per cent solution) there developed shooting pain down the arms and legs of the patient, decidedly injected conjunctivas, flushing of the face, burning sensation in the mouth and salivation. All these symptoms disappeared in three hours except the flushing of the face, which lasted for twelve hours. BAL was withheld for nineteen hours, and then therapy was resumed using a dose of 1 cc. of the 10 per cent solution. No further reactions were encountered. After nine doses of 1 cc. BAL every four hours, the patient was again given an injection of 2 cc. of the solution, and there promptly developed another reaction similar to that of March 15. The blood pressure at the initiation of treatment with BAL was 140 systolic and 100 diastolic; several days after the start of BAL therapy it was 130 systolic and 80 diastolic. The plasma carbon dioxide content was 49 volumes per cent. Under BAL therapy there was prompt disappearance of the exfoliative dermatitis, although scaling from the affected areas continued for some days following treatment.

Case 3.—D. S., a white woman aged 55, complained on March 12, 1946 of pain and swelling in all her joints. The condition was stated to have commenced about twenty years previously in her hands. There was great pain and stiffness of the joints, which was more pronounced in the mornings. The patient was able to walk only when she was assisted and then with considerable difficulty. The physical examination disclosed emaciation of the patient, whose stature was 4 feet 11 inches (150 cm.) and whose weight was 92 pounds (41.7 Kg.). The tongue was atrophic and red, the heart and lungs were normal. The blood pressure was 160 systolic and 90 diastolic. The abdomen was scaphoid and indicated considerable loss of weight. The skin over the abdomen was loose and wrinkled. The extremities showed typical grade 4 rheumatoid arthritis. All joints seemed to be involved.

On examination of the blood, the hemoglobin content was 78 per cent; the erythrocytes numbered 3.9 million and the leukocytes 9,300; the sedimentation rate was 48 mm. (Westergren, 1 hour) and the blood urea nitrogen was 19.5 mg. per hundred cubic centimeters.

The patient received a course of an organic gold compound [11] in the dosage of 10 mg. twice a week for four doses, 25 mg. twice a week for eight doses and 25 mg. a week for nine doses, a total of 445 mg. During the course of this therapy the patient also received 10 units insulin twice a day after meals to encourage appetite. Her weight was quickly increased to 103 pounds (46.7 Kg.), and the patient made a spectacular recovery, soon being free from pain. Four weeks after receiving the last injection of gold intramuscularly, she reported to the hospital to complain of itching hands and feet. Examination revealed seborrheic dermatitis of the exfoliative type, which involved the webs of the fingers and extended up the backs of both hands. The toes and feet were similarly involved. There was bilateral cheilosis. Itching was generalized. Extract of liver was given intramuscularly for a few days, during which time the lesions grew so severe as to require the admission of the patient to the hospital. On admission, the dermatitis had extended to the wrists and ankles and was of the severe exfoliative seborrheic type on an extremely red base. There was intense itching and pain.

Since similar lesions previously had been seen sometimes to disappear spontaneously, it was decided to withhold BAL therapy for twenty-four hours. At the end of this time considerable improvement was noted, and BAL was withheld for another day. Twenty-four hours later, however, the lesions suddenly became worse and the patient was complaining bitterly. It was decided to give 1.5 cc. BAL in oil in a 10 per cent solution every four hours for twenty-four hours and then 1.5 cc. of the drug a day. After the second day of this treatment, the lesions began to subside. There were no untoward reactions to this dosage, and at the end of nine days the dermatitis had cleared and the patient was discharged. Four weeks later the patient was seen, and the skin was still clear. There was no evidence of rash, although there was complaint of occasional itching.

Case 4.—R. F., a white woman aged 40, was seen with a condition diagnosed as rheumatoid arthritis of the left shoulder and knee. Gold therapy [11] was administered as follows: 10 mg. on Jan. 17, 21, 24 and 28, 1946, and 25 mg. on Jan. 31; Feb. 4, 7, 11, 14, 18, 21 and 25; March 4, 11, 18 and 25, and April 1 and 8, 1946. At this time, the patient began to complain of soreness of the mouth and itching of the skin. Examination of the mouth revealed tiny ulcers over the soft and hard palates, on the buccal mucous membrane and sublingually. The patient reported on April 17 with intense pain in her entire mouth, and there was itching of the skin and considerable swelling of both lips. She was hospitalized immediately and given 2 cc. of BAL intramuscularly. This dosage was repeated every four hours during the day and night until ten doses had been given. After almost every injection the patient had pain which extended down both arms and had excessive salivation. After the fifth injection of BAL the itching of the skin had disappeared. There were no cutaneous lesions. Subsequent to the ten doses of 2 cc. BAL, the dosage was reduced to 1 cc. and continued until April 23. She received thirty-three injections of 1 cc., thus making a total BAL dosage of 53 cc. After the tenth injection of 2 cc. of the solution there was pronounced relief of the oral symptoms. There was still evidence of ulceration on April 22, 1946, but there was a decided diminution in the size and the severity of the buccal ulcerations, and the patient was so comfortable as to request discharge. At this time the hemoglobin level was 85 per cent; the erythrocytes numbered 4.3 million and the leukocytes 7,500, with 62 per cent polymorphonuclears and 38 per cent lymphocytes.

The response of this patient to BAL therapy was dramatic, as it is unusual for such a severe oral reaction to abate in so short a period. It is believed that BAL can be credited with the prompt subsidence of symptoms.

Case 5.—F. M., a white woman aged 65, on May 5, 1945 complained of pain and swelling in both knees, wrists and ankles for the past six months. The rest of her history was irrelevant, except that a diagnosis of rheumatoid arthritis was made and a course of gold therapy [11] was suggested. Accordingly, the patient received 10 mg. of the metallic compound for four doses given intramuscularly, 25 mg. for six doses and 50 mg. for four doses, a total of 390 mg. At this stage dryness of the mouth developed, and 4 units crude extract of liver was administered intramuscularly in place of gold twice a week. After four doses of the liver preparation the dryness of the mouth disappeared, and since articular improvement had been so favorable, gold therapy was resumed in a dosage not to exceed 25 mg. The course was completed with seven doses of 25 mg. given at weekly intervals. In all the patient received a total of 565 mg. of the gold compound. At the end of the course of gold therapy the patient was much improved, although there was still some swelling and pain in the joints.

Examination of the blood on Feb. 26, 1946 revealed: hemoglobin 71 per cent; erythrocytes 3.63 million; leukocytes 10,400, and sedimentation rate 58 mm. (Westergren, 1 hour).

On April 10, 1946 the patient complained of a burning sensation in the eyes. Four units of crude extract of liver was given twice a week until July 8. There was little improvement in the ocular condition, but there was no increase in the symptoms. The patient began on July 10 to complain of severe pruritus, and 6 units of crude extract of liver was given intramuscularly. On July 12 the pruritus and conjunctivitis were considerably worse, and 6 units of crude extract of liver was given intramuscularly. Beginning July 17 2 cc. BAL was given intramuscularly every four hours for two days, a total of 24 cc. Subsequent to this the pruritus and conjunctivitis practically disappeared. There was no untoward reaction to the drug, 2 cc. of which was now administered daily. At the end of one week the pruritus and conjunctivitis had completely disappeared. The patient was last seen Oct. 25, 1946, and she reported that her joints were much improved and that the itching and the burning of her eyes had not recurred.

---

[11] Solganal-B Oleosum, an oily suspension of aurothioglucose, an organic compound containing 50 per cent gold for intramuscular injection, was supplied by Dr. William H. Stoner, Schering Corporation, Bloomfield, N. J.

Case 6.—*M. B.*, a Negro woman aged 63, had generalized rheumatoid arthritis. From Oct. 30, 1945 to Jan. 17, 1946 the patient received 590 mg. of an organic gold compound;[11] the minimum dose was 10 mg. and the maximum dose 50 mg. Gold therapy was stopped on January 17 because of itching of the skin. The arthritis was much improved. On Feb. 6, 1946 the itching of the skin disappeared and gold therapy was resumed. The dosage was 25 mg. at semiweekly intervals for four doses and 50 mg. for two doses, a total of 790 mg. of the gold compound.

Examination of the blood on Feb. 23, 1946 disclosed a hemoglobin level of 75 per cent; the erythrocytes numbered 3.9 million and the leukocytes 2,500. At this time the patient complained of generalized itching of the skin, and gold therapy was discontinued.

Dermatitis developed March 4, 1946, and 4 units crude extract of liver was administered intramuscularly every other day. On March 15 seborrheic dermatitis of the exfoliative type extended over the face, neck, chest, back and legs. Until March 22 the dermatitis grew progressively worse, so BAL therapy was started. On March 22 and 23 the BAL dosage was 2 cc. every four hours for seven doses, a total of 14 cc. On March 24 and 25 the dosage was 2 cc. every four hours (waking hours only), a total of 16 cc. The pruritus was decidedly lessened. From March 26 to 31, 2 cc. BAL was administered twice a day, a total of 24 cc. At this time the patient complained of lacrimation and of pains in her muscles. From April 1 to 8 the dosage of the drug was 2 cc., a total of 16 cc. The dermatitis was materially improved, although scaling was pronounced. The dosage from April 9 to 22 was 1 cc. BAL twice a day, a total of 28 cc. The scaling had completely subsided. There was no more complaint of cutaneous itching, and the patient was relatively comfortable. The dosage from April 23 to May 5 was 1 cc. of the drug, a total of 14 cc. As there seemed to be no further need for BAL therapy, it was discontinued. Except for slight residual pigmentation of the skin the patient was completely recovered from the dermatitis, and she retained the improvement in regard to the articular symptoms.

This patient received 112 cc. BAL without severe untoward reactions. The degree of recovery from the gold intoxication is considered to be excellent.

SUMMARY

1. Five cases of acute poisoning due to gold and 1 of acute poisoning due to arsenic have been treated successfully with intramuscular injections of BAL (2,3-dimercaptopropanol).

2. Transient symptoms of BAL toxicity included a sense of warmth in the mouth, salivation, flushing of the face, conjunctival injection, lacrimation and pains in the arms and legs. It is suggested that the newer, less toxic BAL derivatives be employed in a study of toxic reactions to gold.

3. The number of cases reported here is too small to justify a definitely favorable interpretation of results, yet the prompt clinical effects are impressive and warrant more extended use of this drug in the relief of gold intoxications, so that eventually chrysotherapy of rheumatoid arthritis may be employed more generally and with less fear of the otherwise devastating toxic reactions.

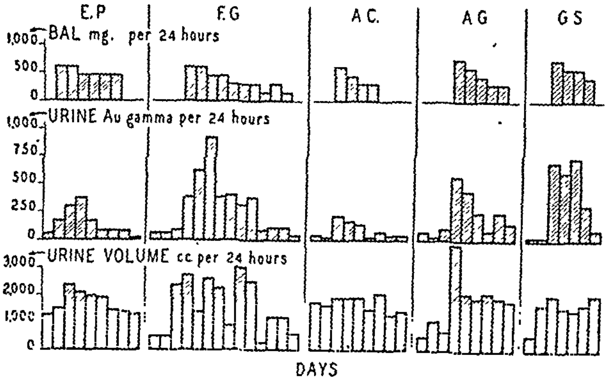
THE TREATMENT OF GOLD DERMATITIDES

Use of BAL (2,3-Dimercaptopropanol)

CHARLES RAGAN, M.D.
and
RALPH H. BOOTS, M.D.
With the technical assistance of Audrey F. Grubin, B.S.
New York

In the past ten years much has been done with gold therapy in the treatment of rheumatoid arthritis. The work of Freyberg[1] and his associates on the metabolism of gold and numerous reports on chrysotherapy by other workers[2] have simplified the problem of gold administration to a certain extent. However, the use of gold compounds in the treatment of rheumatoid arthritis remains on an empiric basis and is still far from universally accepted.[3]

Toxic reactions to gold have been a serious deterrent to its use in therapy. Even under the most careful clinical supervision, the administration of gold to human subjects continues to be attended with definite hazards. The occurrence of certain manifestations of toxicity—notably the dermatitides—cannot be predicted by any known clinical or laboratory method.[4] It is therefore important to control these reactions rapidly once they develop. In certain patients we have been able to stop the pruritus and favorably influence dermatitis due to gold with BAL (2,3-dimercaptopropanol), and it is the purpose of this paper to describe our results.



Excretion of gold in the urine following the administration of BAL (2,3-dimercaptopropanol).

During the war interest was centered on drugs which might counteract the toxic effects of the trivalent arsenical compounds used as antipersonnel agents in the form of lewisite and similar gases. The hypothesis had been formulated that the toxic effects of trivalent arsenical compounds were due to inactivation by arsenic of the sulfhydryl group in enzyme proteins in the host and that the therapeutic effect of arsenic in syphilis was due to a similar affinity for a sulfhydryl group in

the Treponema pallidum.[5] An effort was therefore made to find a drug which would compete effectively for arsenic with the sulfhydryl groups in the various proteins of the body. It was essential that the compound formed with arsenic be inert and that it be excreted promptly.[6] This led to the development of 2,3-dimercaptopropanol, commonly known as British anti-Lewisite, or BAL,[7] which was found to bind arsenic rapidly. It was soon discovered that, to be effective, BAL must be administered soon after the arsenic combined with the sulfhydryl enzymes, otherwise the effect of the metal on the enzyme became irreversible.

Investigation with BAL was extended to other heavy metals, including mercury.[8] In one, cadmium,[7a] the compound formed between the drug and the metal was found to be toxic and to cause appreciable renal damage.

Since we were dealing with a heavy metal in the use of gold compounds in rheumatoid arthritis, we felt that a study of the effects of BAL in toxicity due to gold was indicated. Preliminary studies were made with rats, which were given gold and, after an interval, treated with the drug. No toxic effects similar to those observed with cadmium were found. Sections of kidney, heart and liver of these animals were not abnormal.[9] These results seemed to justify a trial of BAL on human subjects.

RESULTS

Five patients with dermatitis due to gold were treated with BAL.[10] The patients were on the wards of the Presbyterian Hospital. Twenty-four hour specimens of urine were collected, and the concentration of gold in the urine was determined by a modification of the method of Block and Buchanan.[11] All 5 patients showed a definite increase in the excretion of gold in the urine coincident with treatment with BAL (see the accompanying chart).

In 4 patients who had had a rash due to gold for less than two months prior to treatment with BAL there was a prompt subsidence of pruritus with rapid clearing of the rash within a month. The fifth patient (F. G.), who had an extensive rash which had been present for three months before treatment, noticed no change in the itching; the rash was resistant to BAL therapy. At present, eleven months after onset, it is clearing slowly after radiotherapy (see the accompanying table). This patient presumably was treated after the toxic changes produced by the gold had become irreversible, since the excretion of gold was equal to or greater than that found in the patients who showed a satisfactory clinical response.

Four patients (E. P., A. C., A. G. and G. S.) were free of symptoms of arthritis while the rash due to gold was maximal; the fifth, F. G., continued to have some pain in the joints. Within a month after treatment with BAL 4 patients (E. P., A. C., A. G. and F. G.) showed an exacerbation of their articular symptoms; the fifth, G. S., had finished BAL therapy only two weeks before this writing. It is our impression based on these observations that the administration of this drug may cause an early relapse of rheumatoid arthritis in patients who are in remission following chrysotherapy. Objective evidence for this has been difficult to obtain because an elevated sedimentation rate may accompany a rash due to gold. This is a small group of patients, and spontaneous remissions and relapses are the rule in this disease.

Response of Gold Dermatitis to Treatment with BAL

Patient	Total Gold Compound, Mg.	Total Metallic Gold, Mg.	Date Last Gold Administered	Date of Onset of Rash	Date of Start of BAL Therapy	Interval Between Administration of BAL and Onset of Rash, Days	Total BAL, Mg.	Day of BAL Therapy That Pruritus Ceased	Clearing of Rash After Start of BAL Therapy
E. P.	1,050	525	1/ 2/46	1/18/46	1/21/46	3	2,400	1st	6th day
F. G.	1,000	500	12/11/45	12/20/45	3/25/46	95	3,300	Not affected	Still present 8 mos. after treatment
A. G.	385	193	8/20/46	9/ 3/46	9/23/46	20	2,700	1st	Clearing rapidly 1 mo. after BAL
A. O.	355	173	7/ 3/46	7/14/46	8/ 8/46	25	1,650	3d	7th day
G. S.	385	193	8/26/46	9/ 6/46	10/31/46	54	2,400	1st	2 weeks

These observations may throw some light on the mechanism of the action of gold in rheumatoid arthritis and on the development of toxicity following its use. Since it is known that BAL reactivates sulfhydryl enzyme systems poisoned by heavy metals, the dramatic relief of pruritus and gold rash with BAL would seem to indicate that the development of rash with pruritus following chrysotherapy is due to the toxic effect of gold on some enzyme system containing a sulfhydryl group. The recurrence of arthritic symptoms after the rapid elimination of gold brought about by BAL would further suggest that the therapeutic effect of gold is a temporary suppression of the processes which cause activity in rheumatoid arthritis. This is consistent with our observation of the high rate of relapse in patients subsequent to gold compound therapy.[4a]

SUMMARY

1. In rats the administration of BAL (British Anti-Lewisite, 2,3-dimercaptopropanol) and gold was not followed by toxic effects.

2. The drug was used to treat 5 patients with dermatitis due to gold.

[9] Dr. Joseph E. Flynn of the Department of Pathology examined these sections.

[10] Dr. Harry Eagle of the Johns Hopkins Hospital and the United States Public Health Service kindly furnished us with our original supply of BAL before it became generally available.

[11] Block, W. D., and Buchanan, O. H.: The Microdetermination of Gold in Biological Fluids, J. Biochem. **136:** 379, 1940

3. In all 5 patients there was a significant excretion of gold in the urine coincident with the administration of this drug.
4. In 4 patients in whom the dermatitis had existed for less than two months the pruritus ceased and the rash cleared under treatment with BAL. In 1 patient in whom the rash had existed for three months the pruritus continued, as did the rash.
5. It is suggested that a gold rash is due to the toxic effect of gold on an enzyme system containing a sulfhydryl group.
6. Four patients had an increase in their symptoms of rheumatoid arthritis within a month following the administration of BAL. The fifth has just finished BAL therapy.
7. This is construed as further suggestive evidence that the therapeutic effect of gold is a temporary suppression of the processes which cause activity in rheumatoid arthritis.

TREATMENT OF TWO REACTIONS DUE TO GOLD

Response of Thrombopenic Purpura and Granulocytopenia* to BAL Therapy

L. MAXWELL LOCKIE, M.D.
B. M. NORCROSS, M.D.
and
C. W. GEORGE, M.D.
Buffalo

The use of gold salts in the treatment of rheumatoid arthritis is not without danger. We have encountered an incidence of toxic reactions of about 20 per cent. Among the frequent reactions are dermatitis, stomatitis and glossitis. Those less frequent in our experience are colitis, albuminuria, hematuria, nephrosis, purpura and granulocytopenia. The treatment of the more serious reactions (nephrosis, exfoliative dermatitis, purpura and granulocytopenia) has been unsatisfactory, and fatalities have occurred in the past. Recently, when we encountered 2 reactions (thrombopenic purpura and granulocytopenia), it was decided to employ BAL (British Anti-Lewisite, 2,3-dimercaptopropanol), as this substance has been valuable in the treatment of other types of metallic poisoning (that due to arsenic and mercury).

REPORT OF CASES

Case 1.—A white man aged 34, who weighed 160 pounds (72.6 Kg.), was seen in November 1945 with rheumatoid arthritis, which had been present since February 1945. He was started on gold therapy in January 1946 and was given gold sodium thiomalate (Myochrysine Merck) from Jan. 22, 1946 to April 30, 1946. Gold was administered intramuscularly at weekly intervals. The largest single dose was 40 mg., and the total amount of gold administered was 360 mg.

Table 2.—*Hematologic Data in Case One*

White blood counts and differential counts normal; urinalyses negative

On May 8, 1946 the patient complained of bleeding from his gums, and a few purpuric areas were found on his arms and legs. Gold therapy was discontinued, and he was started on a regimen of extract of liver administered intramuscularly, with ascorbic acid and vitamin K given intravenously. Examination of the blood on May 8 failed to reveal any platelets. He was admitted to the hospital on May 10 and was there until June 10. During his hospital stay, he was treated with repeated transfusions of blood, folic acid and massive parenteral vitamin therapy. There was a slight improvement of the bleeding time and platelet count and of the bleeding phenomena clinically. From June 10 to August 8 he continued to have some bleeding from his gums and a few purpuric and petechial spots on his body. Several blood counts were performed in this period. The number of platelets was exceptionally low in every count, and the bleeding time remained prolonged. Repeated urinalyses were normal.

About July 10 the patient began to complain of severe headache. No neurologic signs could be determined on repeated examinations. He refused to return to the hospital until

---

* From the University of Buffalo School of Medicine and the Buffalo General Hospital.

July 31, when he was admitted for three blood transfusions. He was discharged on August 3, with no complaints. On August 7 he again complained of a severe headache, and on August 8, after he was seen at home in a comatose state, he was readmitted to the hospital. The neurosurgeon diagnosed a subarachnoid hemorrhage and diffuse petechial intracerebral hemorrhages due to the thrombopenia. The pressure of the spinal fluid was elevated (360 mm. of water), and there was a faint xanthochromic color to the fluid. Because of the critical condition of the patient and his failure to respond to all previous treatment, BAL therapy was instituted on August 8. He was given 1.8 cc. (180 mg.) of a 10 per cent solution of BAL in oil [1] intramuscularly every four hours for the first forty-eight hours and then 1.8 cc. of the drug twice a day for ten days. Within twenty-four hours after the initiation of BAL therapy the patient was conscious, responded well and showed no further evidence of any cerebrovascular disturbance. His spectacular improvement has been maintained to the present time. Subsequent to BAL therapy, the platelet count increased from about 15,000 to 120,000, and there has been no evidence of any bleeding phenomena or neurologic disturbance. The last platelet count, on November 18, was 130,000.

During this patient's course of BAL therapy there developed inflammation (redness, heat, pain and induration) of the right buttock, which subsided in forty-eight hours under conservative treatment. No other reaction was encountered. Representative hematologic data are given in table 2.

CASE 2.—A white man aged 54, who weighed 117 pounds (53 Kg.), was seen in September 1946 with severe generalized rheumatoid arthritis of six years' duration. He was hospitalized on September 13 and was started on intensive therapy (including gold, transfusions of blood, physiotherapy and roentgen therapy to several joints). He was given gold sodium thiomalate, 10 mg. at two day intervals, receiving a total of 140 mg. intramuscularly between September 13 and October 8, when it was discontinued because of granulocytopenia. BAL therapy was instituted on the afternoon of October 14, when the granulocytopenia became worse (only 3 granular cells were present) and the patient began to feel ill. He was given 1.4 cc. (140 mg.) of the solution of BAL [1] intramuscularly every six hours for the next forty-eight hours and then 1.4 cc. twice a day for eight days. At the end of seventy-two hours (October 17) the patient felt greatly improved, and apparently a satisfactory response to BAL therapy had occurred. Within this period the granulocytes increased to 17 cells. By October 23 an average of 45 granular cells was present. This patient has maintained a normal differential count. Representative hematologic data are given in table 1.

An abscess of the left buttock at the site of injection was incised and drained of a large amount of purulent material.

SUMMARY

Two serious reactions (thrombopenic purpura and granulocytopenia) to gold salt therapy have been described. Spectacular recovery occurred in each instance. The usual course of such complications appears to have been definitely altered by BAL (2,3-dimercaptopropanol) therapy. No change in the status of the arthritis occurred.

A possible complication was the incidence of inflammation of the buttock in case 1 and a gluteal abscess which required drainage in case 2.[2]

BAL therapy deserves further trial in the treatment of reactions caused by gold salts.

---

[1] The dosage of BAL (supplied by Hynson, Westcott & Dunning, Inc.) was calculated on the basis of 2.5 mg. of the drug per kilogram of body weight.

PERONEAL PALSY CAUSED BY CROSSING THE LEGS

MAJOR SIMON H. NAGLER
and
MAJOR LEO RANGELL
Medical Corps, Army of the United States

Of the peripheral nerves closest to the surface, least protected and most vulnerable to both acute and chronic trauma, the common peroneal nerve ranks high. Thus, Wilson [1] places it second only to the musculospiral and ulnar nerves for frequency of damage, while it stands first in Cassirer's [2] series of over 1,000 cases. This nerve is particularly susceptible to injury not only where it runs its independent course but even as it runs side by side with the tibial nerve in the sciatic trunk. For example, among 71 cases of wounds of the sciatic nerves studied by Stewart and Evans (quoted by Wilson [1]), signs were restricted to the peroneal nerve in 33 cases and in only 3 to the tibial. Between 10 and 15 per cent of all injuries of the peripheral nerves, according to Clark,[3] involve the common peroneal nerve.

Because of its anatomic relationships, the nerve is particularly exposed to injury, both of the pressure and the tension variety, as it bends around the neck of the fibula. At this point both the main stem and its two branches, the deep and superficial peroneal nerves, are thinly covered and therefore easily subject to the effects of direct pressure. Furthermore, the common peroneal nerve being relatively fixed, flexion at the knee exerts abnormal tension on it, while at the same time it compresses the nerve against the neck of the fibula. Thus the nerve suffers the effects of both pressure and traction from such positions as crouching, squatting or kneeling, which accounts for the long-recognized occurrence of peroneal palsy as an occupational neuritis in trades or occupations requiring the adoption of these positions. Thus it has been known to occur commonly in miners, agriculturists and coal pickers.[4] More obvious cases of palsy due to pressure on the peroneal nerve result from the application of casts [5] or adhesive plaster,[6] or are secondary effects of positions on the operating table,[7] as in protracted labor. Persistent strain or continuous repetition of movement may induce "neuritis," according to Wilson,[1] especially when there is a preexisting toxicosis. Thus, Wilson has seen foot drop develop after long hours at the treadle of a sewing machine in the case of a woman suffering from rheumatism.

The advent of war with the numerous new occupations which it has engendered has led to the assumption of new occupational positions, some of which are inevitably traumatic to susceptible peripheral nerves. Laird and Mueller [8] have described peroneal palsy, partial and temporary, in bombardier cadets subsequent to their kneeling over the bomb sights on long bombing missions. They point out that in that position the circulation to the leg is decreased simultaneously with the subjection of the peroneal nerve to abnormal tension. We have had the opportunity to see a number of cases of unilateral peroneal palsy occurring in persons in various types of military occupations, particularly in air crew technicians. Eight cases of peroneal paralysis have been collected, while many more have been seen in which there were only mild subjective sensory phenomena. The occurrence of this complication in a new and constantly growing occupation is worth reporting and pointing out to aid in quick recognition in the future and in prompt institution of remedial measures.

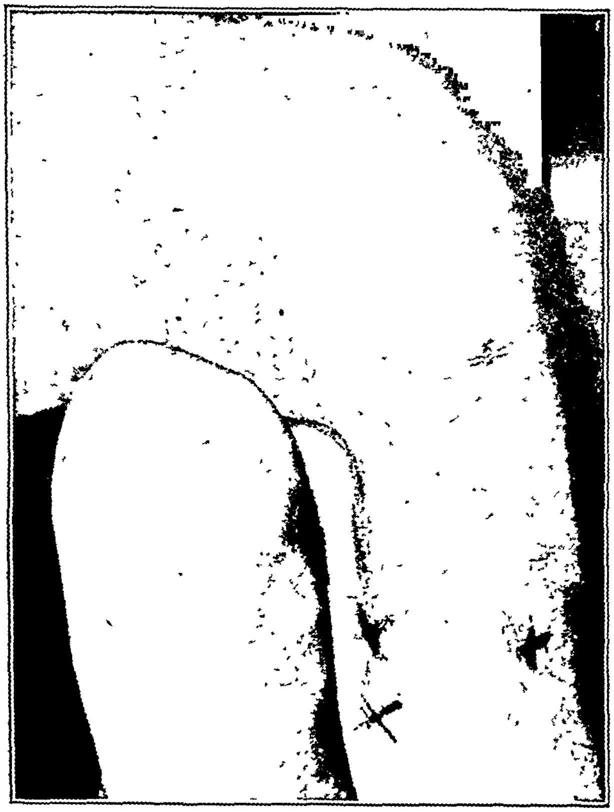

Fig 1.—Photograph of patient of case 1 with right leg crossed over left, the head and neck of the right fibula being outlined. It demonstrates the close opposition of this bone segment to the left patella and the external condyle of the left femur, the right common peroneal nerve being compressed between them.

Sitting with the legs crossed, a ubiquitous habit in modern man, is strikingly brought out as a common factor in producing the symptoms referable to the peroneal nerve in our observed cases. This habit, particularly prevalent in men, has been described a few times before as a factor in the production of peroneal palsy, but has for the most part been overlooked and neglected as a causal agent in this condition. Except for Gerhardt (quoted by Oppenheim[9]), who described a case in which peroneal palsy developed in a man who had fallen asleep with his knees crossed, Woltman[10] was the first really to direct attention to this etiologic factor. This author, in 1929, collected 27 cases from the files of the Mayo Clinic and stressed the importance of loss of weight, senility and protracted convalescence as prerequisites in the operation of this factor. Eaton[11] reported another case in 1937 in which "only after considerable loss of weight had the patient been able to cross the legs completely enough to traumatize the common peroneal nerve." This author also pointed out that failure to recognize the causation in his case almost led to needless laminectomy. Dunning[12] recently reported a case of bilateral peroneal palsy due to pressure from a long-standing habit of crossing the legs. This factor is also mentioned by Wilson,[1] who comments: "In view of the frequency with which sitting with pressure of one lower limb crossed on the other produces the feeling that the leg or foot has gone to sleep, it is curious how seldom genuine sleep palsies of the kind have been reported."

Our experience with the cases to be reported and our questioning of many persons who chronically sit with their legs crossed have revealed that this factor is much more commonly operative than hitherto supposed and should be suspected in every case of peroneal palsy, particularly of the unilateral type. Often a combination of factors produces damage of the peripheral nerves. The following 8 cases, which emphasize a rather interesting group of such causal factors, are believed not only to be of significance for military medicine, but to have general neurologic interest and importance

REPORT OF CASES

Case 1.—A 33 year old radio mechanic and operator was admitted to the hospital in May 1944 because of inability to raise his right foot. A month before, while he was sending and receiving code, the top of his right foot up to the ankle "went to sleep." He had been sitting for about an hour with legs crossed, the right knee uppermost and wedged beneath the table top. When he stamped about to "awaken" his foot, he first noted that he was unable to raise it. The paresthesia vanished in a short time and did not reappear, but the loss of motor power remained unchanged up to the time of admission

The patient volunteered that he habitually crossed his right leg over the left in sitting. This had occasionally resulted in brief tingling of the top of the right foot, but never in weakness. For six weeks prior to onset of the palsy the soldier had sat daily for several hours with his knees crossed and wedged beneath the table top. There was no history of alcoholism, exposure to lead or evidence of any other exogenous or endogenous neurotoxin.

Examination revealed a tall, asthenic man, 5 feet 11 inches (180.3 cm.) in height, weighing 165 pounds (74.8 Kg.). There was a steppage gait on the right, with motor disturbances typical of involvement of the common peroneal nerve but without sensory disturbances. Electrical studies revealed a partial reaction of degeneration in the muscles supplied by the right common peroneal nerve. When the patient sat with legs crossed in his habitual manner, it was readily observed that the right common peroneal nerve was compressed between the head of the right fibula on the one hand and the left patella and external condyle of the left femur on the other (fig. 1). The nerve was not thickened.

Comment.—A case of unilateral peroneal palsy, of apparently obscure causation at first, was readily explained on the basis of chronic pressure on the common peroneal nerve due to the habit of sitting with legs crossed. For years the nerve had been repeatedly traumatized, but a warning paresthesia had prevented prolonged pressure. Under the stress of military activity, this signal of alarm had been ignored, resulting in the more damaging compression. Moreover, additional traumatizing pressure was produced by wedging the crossed legs beneath a table top. The action of toxins could be ruled out. A dissociated form of paralysis was present, which will be commented on later. It might be of interest at this point to mention that this patient's symptom was considered a conversion reaction and that he was treated psychotherapeutically and with narcotherapy for several weeks prior to the establishment of the correct diagnosis.

[12] Dunning, H. S.: Injury to the Peroneal Nerve Due to Crossing the Legs, Arch. Neurol. & Psychiat **51:** 179-181 (Feb.) 1944.

Case 2.—A 37 year old soldier was seen in consultation in June 1944 because of a left foot drop of six months' duration. The condition was first noted a month after the soldier's induction with gradual weakness of the left foot and numbness of the lateral aspect of the left leg. There were no other neurologic symptoms. There was a history of alcoholism in the past, but there had been no drinking for eight years prior to the present complaints. There was no evidence for any other exogenous or endogenous toxins. For three or four months prior to his induction the soldier had been a milking machine operator, kneeling in a squatting position during almost the entire working day. More significantly the soldier admitted a life-long habit of crossing his legs while sitting, practically always the left over the right. It is of interest that he had been in several other hospitals because of his foot drop, and efforts were made to rule out a clinical suspicion of a lesion of the spinal cord.

Examination revealed a tall, angular man, 6 feet 1½ inches (186.7 cm.) tall, weighing 172 pounds (78 Kg.). Neurologic examination demonstrated the classical motor and sensory disturbances of involvement of the left common peroneal nerve. This nerve was palpable and definitely thickened in its course lateral to the neck of the fibula. Electrical studies showed a partial reaction of degeneration in the involved muscles. When the patient sat with the left leg crossed over the right as he habitually did, it was readily demonstrated that the left common peroneal nerve was compressed between the neck of the left fibula on the one hand and the right patella and external condyle of the right femur on the other (fig. 2).

Comment.—In this case the seemingly harmless habit of sitting with crossed legs resulted in a vulnerable peroneal nerve, which finally succumbed to added insult. Prolonged tension on the nerve due to the constant squatting posture in the operation of the milking machine and similar positions assumed during basic training were sufficient to produce the disabling neuropathy. It is unlikely that the patient's long past alcoholism played any causal role.

Case 3.—A 44 year old airplane mechanic was seen in consultation in July 1944 because of difficulty in walking due to a right foot drop of eighteen months' duration. The patient also occasionally noted "numbness" of the dorsum of the right foot and the lateral aspect of the right leg. The symptoms had been stationary for the last year.

The patient was a moderate user of alcohol, rarely to intoxication. From 1929 to 1932 he had as a painter been exposed to lead but had had no apparent effects. During the past two years his military occupation had required the assumption for considerable periods of kneeling, crouching and squatting positions, all such as to result in prolonged tension on the peroneal nerves. When specifically questioned, he disclosed his habit of sitting with legs crossed, almost always with right over left.

The patient was an asthenic man, 5 feet 7 inches (170.2 cm.) tall, weighing 146 pounds (66.2 Kg.). There was steppage gait on the right. Neurologic examination revealed the classical motor and sensory disturbances of involvement of the right common peroneal nerve. When the patient sat in his habitual manner, right leg crossed over left, the right common peroneal nerve was shown to be compressed between the neck of the right fibula on the one hand and the left patella and external condyle of the left femur on the other.

Comment.—The moderate use of alcohol and the exposure to lead many years prior to the palsy cannot be considered causally relevant. The prolonged tension incident to occupational positions produced a traumatic neuritis in a nerve previously sensitized by chronic pressure due to the habit of sitting with legs crossed.

Case 4.—A 28 year old soldier was admitted to the hospital in August 1944 because of weakness of the right foot of three weeks' duration. At the time of its onset there was an evanescent numbness of the right leg. The patient had been an armorer and gun turret maintenance man at an Army Air Force base for nine months at the time his difficulty began. Because of his unusual height he had to assume awkward and cramped positions while working within the gun turrets. In addition his duties required him to work long periods in squatting, crouching and kneeling postures (fig. 3). Questioning elicited the presence of a life-long habit of sitting with legs crossed, almost always with the right over the left, which had frequently resulted in numbness and tingling of the right leg and foot. The patient had been drinking several bottles of beer daily for the past few years. There was no history of exposure to lead or other neurotoxins.

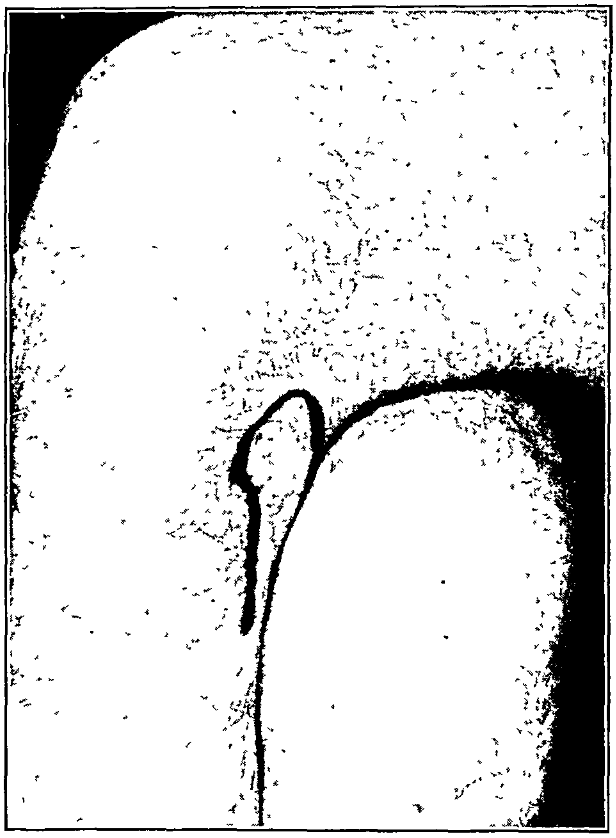

Fig. 2.—Photograph of patient of case 2 with left leg crossed over the right, the head and neck of the left fibula being outlined. It demonstrates the close opposition of this bone segment to the right patella and external condyle of the right femur, the left common peroneal nerve being compressed between them.

The patient was an asthenic, young man, 6 feet 4 inches (193 cm.) tall, weighing 184 pounds (83.5 Kg.) Neurologic examination revealed the typical motor and sensory disturbances of involvement of the right peroneal nerve. When the patient sat with legs crossed as was his wont, it was readily demonstrated that the right common peroneal nerve was pinched between the right fibula on the one hand and the left patella and the external condyle of the left femur on the other (fig. 5)

Comment.—A nerve subjected to the deleterious effects of repeated pressure finally succumbed to a final insult due to prolonged tension during occupational postures. The mild alcoholism probably did not contribute to the injury. This case demonstrates the wisdom of the height limitation imposed on gunners. A ball turret, as is well illustrated in figure 4, imposes a cramped and consequently nerve-traumatizing position on a tall occupant.

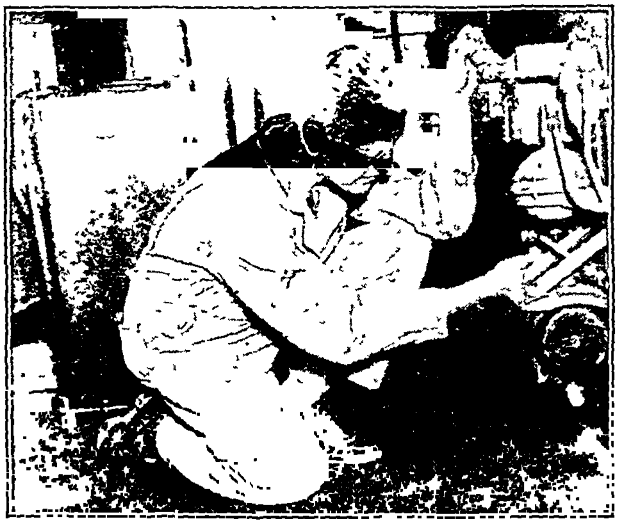

Fig 3.—Photograph of patient of case 4 in one of his working postures. In this kneeling position the vulnerable right peroneal nerve is subjected to traumatic tension.

Case 5.—A 38 year old artillery officer while serving on the Anzio beachhead in January, 1944, noted a "flapping" of his right foot in walking. This had been preceded by numbness along the lateral aspect of the right leg and dorsum of the right foot. Before his evacuation to the United States a functional diagnosis had been considered, but he was admitted with a diagnosis of peroneal palsy of undetermined origin.

Prior to the onset of his foot drop he had lost 27 pounds (12.2 Kg.) as a result of his combat experiences and many weeks on "iron rations." He had spent long periods in a *squatting position as artillery observer and at least three or* four hours daily sitting with the right leg crossed over the left as he rested a map board on his lap for study. He volunteered that it was his confirmed habit to sit with crossed legs, always the right over the left. This would frequently result in "sleepiness" of the right leg and foot. For many years in his civilian capacity as football coach he assumed the squatting position frequently. There was no history of chronic alcoholism.

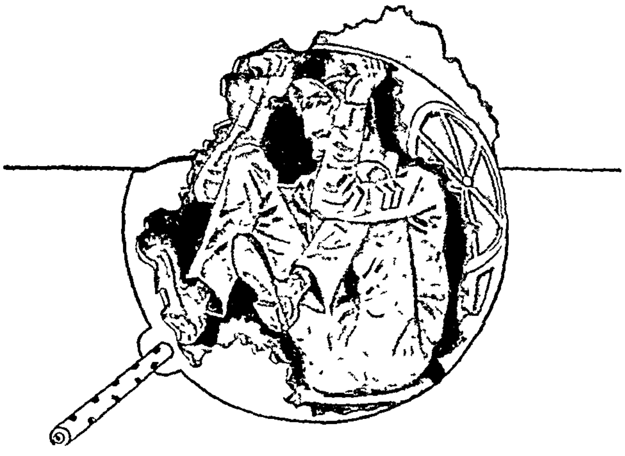

Fig. 4.—Drawing of a tall man, such as the patient of case 4, in a ball turret illustrates the awkward posture, which results in tension on the peroneal nerve

The patient was 5 feet, 10½ inches (179.1 cm.) tall, weighing 154 pounds (69 9 Kg.). There was a right steppage gait. Neurologic examination revealed only the typical motor and sensory disturbances of involvement of the right common peroneal nerve. This nerve was moderately thickened and, when the patient crossed his legs in his habitual manner, it *was seen to be compressed between the right fibula and the* left patella.

Comment.—This case illustrates the collaboration of several factors in the final production of the neuritis. To begin with, the common peroneal nerve had been rendered vulnerable by the habit of sitting with crossed legs and to a lesser extent by squatting for long periods as a football coach. As a result of the loss of weight the nerve was deprived of its protective covering and was more susceptible to the damaging effects of pressure incident to crossing the legs The tension on the nerve due to long periods of squatting and a possible nutritional deficiency per se were additional causal factors.

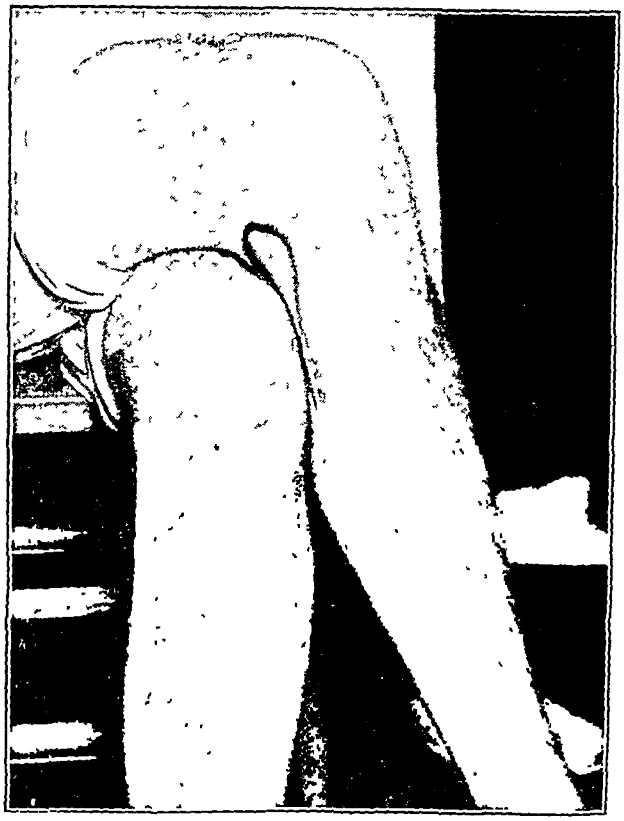

Fig 5.—Photograph of patient of case 4 with right leg crossed over the left, the head and neck of the right fibula being clearly outlined It well demonstrates the opposition of this bone segment to the left patella and the external condyle of the right femur, the right common peroneal nerve being tightly compressed between them.

Case 6—A 21 year old airplane instrument mechanic was seen in consultation in March 1945 because of a left foot drop About a year previously he had experienced symptoms of a left foot drop About a year previously he had experienced symptoms of a duodenal ulcer. He lost 25 pounds (11.3 Kg.) prior to his hospitalization in November 1944 because of his digestive symptoms His duty assignment as instrument mechanic had necessitated frequent crouching and squatting while working in the close quarters of the nose of planes. During his hospitalization from November 1944 to January 1945 he acquired the habit of sitting with legs crossed, left over right, while reading, playing cards, etc. *His foot drop developed* in January 1945. There was no history of alcoholism or exposure to any exogenous or endogenous toxins.

The patient was a thin, asthenic person, 5 feet 10 inches (177.8 cm.) tall, weighing 140 pounds (63.5 Kg.). Neurologic examination revealed the motor and sensory disturbances typical of involvement of the left common peroneal nerve. There was characteristic steppage gait on the left. When he crossed his legs, the left common peroneal nerve was seen to be compressed between the left fibula and the right patella.

Comment.—The habit of sitting with legs crossed conspired with several other factors in this case to produce a pressure neuritis of the left common peroneal nerve. First the nerve had been subjected to undue tensions during occupational positions. Then considerable loss of weight had robbed it of its protective fatty cover, making it more vulnerable to the deleterious pressure effects due to crossing the legs habitually. The nutritional disturbance incident to the peptic ulcer may have been a contributory cause.

CASE 7.—A soldier was admitted to the hospital in March 1945 because of a right foot drop of ten months' duration. At the time of onset he had completed six months of military service. He had had months of training during which crouching and squatting positions were frequent. He had also been on duty with a supply outfit and often had had to squat to obtain supplies from lower shelves. He had long had the habit of sitting with legs crossed, right over left, and would do so while reading or more recently while typewriting. The patient was only a mild social imbiber. There was no history of any other toxic influence.

Examination revealed a tall asthenic man, 6 feet 1 inch (185.4 cm.) tall, weighing 160 pounds (72.6 Kg.). Neurologic examination revealed no abnormalities except for the classical motor and sensory disturbances caused by damage of the right common peroneal nerve. When the patient demonstrated his habitual sitting position, the right common peroneal nerve was noted to be compressed between the head of the right fibula on the one hand and the left patella and external condyle of the left femur on the other.

Comment.—This case demonstrates again the combination of chronic pressure due to crossing of legs and of prolonged tension due to abnormal positions to produce a traumatic neuritis of the common peroneal nerve.

CASE 8—A 34 year old airplane mechanic was admitted to the hospital in August 1945 with widespread flaccid paralysis of all four extremities and a left facial palsy. After thorough study, a diagnosis was made of acute polyradiculoneuritis of Guillain-Barré with albuminocytologic dissociation in the spinal fluid His course in the hospital was one of gradual improvement and resumption of normal power. When seen seven months later, in March 1946, the patient had regained much of his strength, but the chief residual disability was a right foot drop.

Questioning revealed that for over a year prior to the onset of the acute infectious illness the patient had worked in squatting, crouching and kneeling positions as an airplane mechanic. It was further elicited that the patient was a habitual leg crosser, almost always with the right over the left. He had also been a heavy drinker for over fifteen years.

The patient was a thin asthenic man, 5 feet 11 inches (180 3 cm.) tall and weighing 145 pounds (65.8 Kg). Neurologic examination revealed mild residual evidence of widespread disease of the lower motor neurons, but the outstanding abnormality observed, out of proportion to the others, was a right peroneal palsy, with a steppage gait and the typical motor involvement Sitting with his legs crossed in the usual position showed the right common peroneal nerve tightly compressed between the right fibula on one side and the left patella and external condyle of the left femur on the other.

Comment.—In this case there was an acute and widespread infectious process involving the lower motor neurons and resulting in a generalized flaccid paralysis. Chronic severe alcoholism possibly played a causal role in predisposing the peripheral nervous system to infection. Of special importance, however, in determining that the last residual would be a unilateral peroneal palsy was the specific trauma to that nerve by leg crossing and by the traumatizing occupational positions. The multiplicity of causal factors is here well brought out.

COMMENT

Woltman[10] concluded from his series that "crossed leg palsy usually does not appear until the fourth or fifth decade, and is seen most often in patients who are forced into inactivity due to illness, and who have lost considerable weight." The average age of his patients was 51, and most of his patients had had a weight loss averaging 34 pounds (15.4 Kg.). The cases which we have reported demonstrate that middle age, arteriosclerosis and loss of weight with inactivity due to illness are not the prerequisites for the development of peroneal palsy due to crossing the legs.

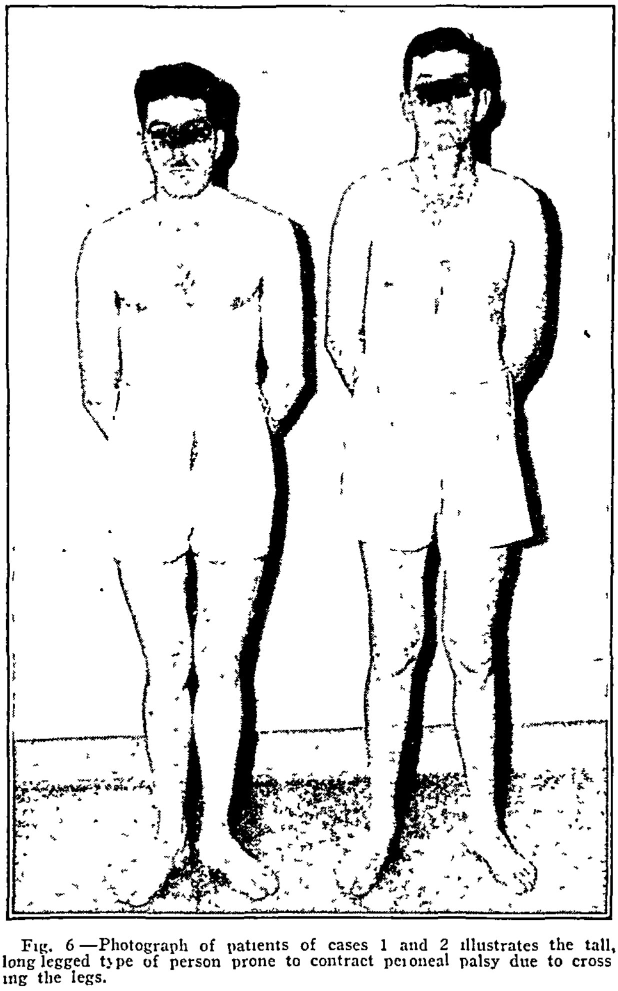

Fig. 6—Photograph of patients of cases 1 and 2 illustrates the tall, long legged type of person prone to contract peroneal palsy due to crossing the legs.

Our patients were predominantly healthy military personnel in active service, with an average age of 33½ years. Activity rather than inactivity played an important precipitating role. All the patients were engaged in military activities placing undue tension on the sensitized peroneal nerve. In only 2 cases did the factor of loss of weight have any causal relevance.

Evaluation of our cases clearly demonstrates that the most important predisposing factor for development of palsy in those who habitually cross their legs is the build of body. It is the tall, long-legged person who is prone to have palsy due to crossing the legs. Our patients were tall, relatively thin and long-legged men, with an average height of 5 feet 11½ inches (181.6 cm.) (fig. 6). Observation of numerous other subjects has shown us that the pyknic, short-legged person is rarely liable to traumatize chronically the peroneal nerve by habitual crossing of the legs. When such persons cross the legs, there is a distance of as much as 6 inches (15.2 cm.) between the neck of the fibula of the uppermost leg and the patella of the lower one (fig. 7). The athletic type or those with intermediate body habitus are also generally safe from this type of trauma to the peroneal nerve. It is the thin, "daddy-long-legs" type of person in whom this possibility should always be considered in evaluating a case of peroneal palsy.

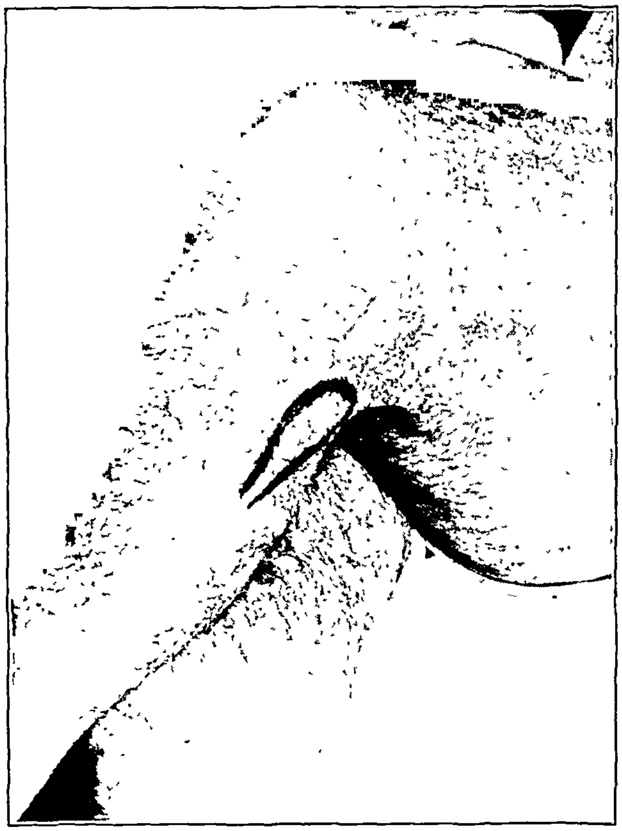

Fig. 7.—Photograph of the crossed legs of a pyknic, short-legged person. The head and neck of the left fibula are outlined to illustrate the long distance of this bone segment from the patella and the femoral condyle of the opposite limb, the common peroneal nerve thus being in no danger of compression.

Observation and discussion with many persons of this build clearly revealed that practically all these persons experience discomfort when crossing their legs in the form of paresthesia and other sensory disturbances along the distribution of the peroneal nerve. In most cases, however, these irritative sensory phenomena are a protective mechanism and lead to quick uncrossing of the legs. Symptoms of motor paralysis are likely to occur in such persons when for some reason this protective mechanism fails. Thus, in occupations in which these persons sit with their legs crossed for long periods while their attention is diverted, or when they fall asleep in this position, more serious symptoms are likely to occur. In many cases the chronic habit only sensitizes the nerve and makes it more vulnerable to later traumatic or toxic agents.

Whenever unilateral peroneal palsy occurs as the only manifestation of a toxic or other systemic disturbance, particularly in persons of the habitus described, the patient should be carefully questioned about sitting habits. Cases of isolated peroneal palsy have been described following the use of sulfapyridine[13] and other drugs.[14] It is not unlikely that in such cases the complication may be the result of the toxic effect of the drug on a nerve previously damaged and rendered vulnerable by the chronic pressure incident to the habit of crossing the legs. It is an extremely simple and expedient procedure in such cases to determine the presence of this factor, and thus readily to eliminate a major cause. Case 8 in our series is a case in point and illustrates the specific action of a generalized infectious process on a locally traumatized and vulnerable nerve.

We agree with Woltman in his description of the particular bones which are involved in exerting the viselike pressure. Our examinations have shown that the nerve is compressed between the head and the neck of the fibula of the uppermost leg on the one hand, and the patella and external condyle of the femur of the lowermost leg on the other. In some cases the patella forms most of the under jaw of the vise, while in others it is the external condyle of the femur which does. Our cases have not borne out the contention of Dunning, who in his case states that the peroneal nerve is compressed between the upper third of the shaft of the fibula of the uppermost leg and the head of the fibula of the lowermost leg.

Of the 8 patients reported on, all had been engaged in military duties requiring the daily assumption of occupational positions traumatic to the common peroneal nerve. It is interesting that of the 8 patients 5 were air crew technicians of various kinds, whose work took them into the cramped quarters of planes, where tall long-legged persons must assume awkward positions. This is a point worth remembering in choice of occupation.

Two of our 8 patients showed a dissociated form of paralysis, with motor but no sensory involvement. This type of disturbance following experimental compression of peripheral nerves has been described by Denny-Brown and Brenner,[15] who believe that the effect of pressure on a nerve is "due entirely to ischemia." When a mixed nerve is subjected to pressure, as noted by Fulton,[16] it is the motor fibers, which are the fibers of largest diameter, which are affected first, since these are most subject both to distortion and to deprivation of oxygen. In our cases ischemia of the nerve occurred because of direct pressure between the bony jaws of the vise as described and also, as in the case of the kneeling and squatting postures, by stretch in the long axis, which would tend to obliterate the vascular supply, which consists of extensive longitudinal anastomoses of vessels.[17]

[16] Fulton, J. F.: Physiology of the Nervous System, ed. 2, London, Oxford University Press, 1943, p. 26.

Four of our patients were referred for consultation because the peroneal palsy was of obscure causation. In 1 case suspicion of disease of the spinal cord led to extensive investigation and almost to needless laminectomy, while in 2 others functional diagnoses were made and psychotherapy given for long periods prior to accurate diagnosis. We believe that if the causal factors demonstrated in the reported cases are kept in mind in considering obscure cases of peroneal nerve palsy, extensive investigations and perhaps even unnecessary laminectomies can be avoided.

A few final words in regard to therapy are in order. By prompt recognition and removal of the causal factors in a case of peroneal palsy due to crossing the legs, one can prevent serious neural damage. Some of our patients even while discussing their condition continued to assume the causative traumatic position. For these patients the deleterious effect of this seemingly innocent habit must be repeatedly stressed. Mechanical support of the foot, radiant heat, galvanism, and adequate nutrition with large doses of thiamine chloride were utilized. The therapeutic results were good.

SUMMARY AND CONCLUSION

Eight cases are reported of unilateral peroneal palsy occurring in healthy military personnel.

A common causal factor present in all 8 cases was the chronic habit of sitting with the legs crossed, which is shown to result, in persons of asthenic habitus, in a compression neuritis of the common peroneal nerve of the uppermost leg. This may either result in symptoms or may merely sensitize the nerve to other causal agents.

Another important causal factor in the reported cases was the assumption of various occupational positions incident to military duties and traumatic to the common peroneal nerve. The reported cases were mostly in air crew technicians.

These factors should be considered in all cases of unilateral peroneal palsy of apparently obscure causation.

Humoral Transmission of Vagal and Accelerator Effects.—Some few years ago Loewi performed a series of experiments which showed decisively that cardiac inhibition resulting from vagal stimulation is due to the liberation of a chemical substance possessing an action similar to that of acetylcholine. It was also shown that the augmentation and increase in heart rate which follow stimulation of the accelerators are due to the action of an adrenalin-like substance. His results have been confirmed by others. . . . It was later demonstrated by Loewi that the heart muscle contained an enzyme—cholinesterase—which rapidly hydrolyzed the ester after its liberation into the relatively inactive choline and acetic acid and so limited the duration of its action. The action of this esterase is inhibited by physostigmine (eserine). The effect of the latter drug in inhibiting the heart depends solely on this action. That is, it prevents the hydrolysis of the vagus substance, which therefore continues to exert its effect. . . . The known materials in the circulating blood which influence the action of the heart are (1) the mineral constituents calcium, potassium and sodium, (2) adrenalin, (3) acid metabolites—carbon dioxide and lactic acid—and (4) oxygen.—Best, Charles Herbert, and Taylor, Norman Burke: The Physiological Basis of Medical Practice, Baltimore, Williams and Wilkins Company, 1945, page 211.

Special Article

HISTORY OF THE AMERICAN MEDICAL ASSOCIATION

MORRIS FISHBEIN, M.D.
Editor, Journal of the American Medical Association
and Hygeia, the Health Magazine
Chicago

(Continued from page 691)

(Note.—*Following is the nineteenth chapter of a history of the American Medical Association, in process of development for publication in connection with the celebration of the Centennial of the American Medical Association in Atlantic City in June 1947.*

The general account of the history of the Association will be followed by individual histories of the various councils, bureaus publications and other activities of the Association. The general account is written by the editor of The Journal. *Each of the other historical contributions will be by a member of the individual council, bureau or agency responsible and now associated with it or directly related to its work. Included will be photographs, signatures and a brief biography of each of the hundred presidents of the American Medical Association. This feature has been prepared by Dr. Walter L. Bierring.*

It will be impossible to publish all of the material in The Journal. *The complete work will be published in book form It is hoped to have it available by the time of the annual session.*—Ed.)

CHAPTER 19. *The Medical Trust and Oligarchy?*

1910-1914

1910

ST. LOUIS

AN AUTOMOBILE NUMBER

By 1910 the motor car had become so definitely an important factor in the practice of medicine that The Journal of the American Medical Association issued its first automobile number. The section of The Journal devoted to this purpose appeared in the issue for April 9, 1910; it was entitled "The Choice and Care of an Automobile." It is, in the light of thirty-seven years of subsequent progress with this important appurtenance of medical practice, one of the most amazing collections of information in world history. There are many pictures of the vehicles of that day and some fascinating records of personal experiences of physicians with their vehicles. One section is devoted wholly to the motorcycle, with some debate as to whether or not doctors would do better with motorcycles than with automobiles. One article defends the gasoline propelled vehicle running on railroad tracks. The chapter on the business office pictures some of the advertisements.

THE MEDICAL TRUST?

During this year of the presidency of Dr. William H. Welch came the first organized attack on the American Medical Association as a medical trust. The proprietary medical interests had been so seriously damaged by the exposés which were being regularly published in The Journal of the American Medical Association that they established an agency known as the National League of Medical Freedom. This organization was designed to defeat the Owen bill for the creation of a national department of health but more particularly to discredit and disrupt the American Medical Association. Its attacks centered on the editor of THE JOURNAL, Dr. George H. Simmons. Detectives were employed to search out his past history, to follow him day by day and to muster public opinion against him. Among the leaders in these attacks were such names, now in excellent repute, as those of Dr. Abbott of the Abbott Laboratories and Mr. Post, inventor of the Post products, out of which has come the great corporation known as General Foods.

The attacks were bitter and vicious; full-page advertisements were purchased in newspapers throughout the nation; it became necessary for the editor of THE JOURNAL to answer them personally and publicly. This he did with a systematic analysis of the nature of the attacks and the powers behind them that carried conviction.

THE BOARD OF TRUSTEES

Incidentally for the first time THE JOURNAL published the minutes of an interim meeting of the Board of Trustees, so that the members of the Association might keep abreast of the increasing activities of this most powerful body in the affairs of the Association. By this time the multiple affairs of the Association had developed so greatly that Dr. M. L. Harris was drafted to prepare a form for presentation of the report of the Board of Trustees annually. This form was adopted and has been followed since that time.

THE AMERICAN JOURNAL OF DISEASES OF CHILDREN

The success of the American Medical Association with the publication of the ARCHIVES OF INTERNAL MEDICINE led to petitions for the publication of a journal devoted to pediatrics, presented by a committee consisting of Drs. Isaac Abt and F. S. Churchill. The Board of Trustees established a committee including such distinguished names as those of Drs. Abraham Jacobi, L. Emmett Holt and J. P. C. Griffith to investigate the need for such a publication.

A PERIODICAL ON PUBLIC HEALTH

From the Section on Preventive Medicine and Public Health and the Bureau of Medical Legislation came a request for publication by the American Medical Association of a periodical devoted to public health, for the establishment of scholarships in the field of preventive medicine and for similar purposes. It was proposed also that there be established a council to deal with problems of health and preventive medicine and to rate the public health work of the individual states. The council was to be called the Council on Legislation, Organization and Publicity. From a number of leading surgeons of the United States came a request to publish a periodical devoted to surgery; a committee was established to look into this subject.

When the President of the Association, Dr. William C. Gorgas, distinguished sanitarian of the Panama Canal, made his retiring address to the House of Delagates he noted that some question had been raised as to the right of the President to fill vacancies in standing committees that occurred in interims between meetings of the House of Delegates. The rapid growth of the American Medical Association had resulted in the establishment of too many committees and boards, and there was a tendency to take up new work without completing some of the projects already in hand. Dr. Gorgas was forced to take cognizance that the Association had made bitter enemies of the people engaged in the "patent" medicine business and, "as they command large capital, they are at present making a serious organized fight against us. This is the most altruistic part of our activity for the benefit of others or for the members of the Association."

THE SECRETARYSHIP

In presenting his report to the House of Delegates, Dr. George H. Simmons gave a brief account of his work as secretary of the Association. As far back as 1901 he had wanted to relinquish the position of secretary. In 1904 he suggested again that he resign the secretaryship, but the Board of Trustees advised against this. It had recommended the employment of an assistant to the secretary whose duty it would be to look after the details of that work. The position was filled by Dr. Frederick R. Green, who accepted it and who assumed in 1905 the duties of assistant to the general secretary. Dr. Simmons stated also that he had finally decided that he would not care further to be the secretary of the Association and he now definitely requested the election of a new secretary. He said:

> I realize that it is not usual to refuse a thing, especially an elective office, before it is offered. I think it better, however, to make the announcement now, so that there may be ample time for you to consider carefully whom you shall select for the position.

"For eleven consecutive years," he continued, "I have been unanimously elected general secretary, twice at the general meeting, before the reorganization, and nine times by the House of Delegates." The reference committee recommended to the House of Delegates that the desire of Dr. Simmons be respected, but it paid testimony to his work in a few well chosen words:

> Dr. Simmons needs no assurance as to the temper and position of this body concerning him personally and officially. It always has stood, and stands today, a solid wall behind him and has no words to express fully its high appreciation of his efficient and faithful service.

The committee recommended that his wish be granted

> in order that his great ability may be exclusively devoted to the duties of editor of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION—the best medical journal in existence.

When the Board of Trustees made its report, the statement was read by Dr. M. L. Harris, chairman, who presented a vast amount of material in an exceedingly concise and direct form. He listed the special projects which concerned the organization and he indicated that all the work had been reflected from time to time in THE JOURNAL. Especially, however, did he commend the work of the Council on Pharmacy and Chemistry.

THE PUBLIC HEALTH EDUCATION COMMITTEE OF WOMEN

The Board of Trustees had been greatly concerned over the appointment under somewhat doubtful auspices of a special committee known as the Public Health Education Committee of Women. Apparently a resolution had been adopted by the House of Delegates on

June 10, 1909, offered by Dr. Charles A. L: Reed, requesting the women physicians of the American Medical Association to take the initiative individually in their respective associations, in the organization of educational committees to act through women's clubs, mothers' associations and other similar bodies for the dissemination of accurate information touching these subjects among the people. They were requested to submit to the House of Delegates a yearly report of such work and elect from among their numbers a committee to take charge of it. The Board of Trustees asked the lawyers for the Association to find out whether or not such a resolution would warrant the women physicians of the American Medical Association in appointing such a committee without having it nominated by the President and further whether or not the Board of Trustees would be warranted in paying expenses already incurred by that committee. The attorneys said that there was no provision for any such action in the Constitution and By-Laws and that therefore such a committee had no legal standing as a committee of the Association. Then came a report from the women's committee, which was read by Drs. Rosalie Slaughter Morton and Mary Sutton Macy. These ladies submitted an extensive report indicating how hard they had been working; apparently they requested some funds as reimbursement for some of their activities. Now the chairman of the Board of Trustees called attention to the misunderstanding; he indicated that it was proposed to establish a council for public health education and that the work of this women's committee would probably come under a secretary's bureau for the purpose.

MEDICAL LEGISLATION

At this meeting of the House of Delegates the Committee on Medical Legislation, headed by C. A. L. Reed, made an extensive report on legislation before the Congress and before the individual states. The committee indicated the great importance of a department of publicity to inform the public on legislation affecting the practice of medicine. At this time Dr. C. A. L. Reed tendered his resignation with an extensive valedictory message based on his eight years of experience. A few wise observations in this little known statement merit thought in modern times:

> The time has passed when any organization, however altruistic its purposes, can throw the whole burden of its duties on a single person and expect to pay the obligation by the honor thus conferred.
>
> For any member of the national organization, not a resident of a given state, to appear before the legislature of that state either for or against a given measure, would, under ordinary circumstances, tend to prejudice the cause at issue before the legislators.
>
> It is hardly worth while to work seventeen years for a food and drugs act if its power to protect the people is destroyed by executive interpretation in the short space of seventeen months.

The Board of Public Instruction on Medical Subjects, which was eventually to be merged into the Council on Health and Public Instruction, had published two popular articles during the year—one on the venereal peril and the other on typhoid. The committee on ophthalmia neonatorum was making great progress toward the acceptance of its proposals by the individual states.

DAVIS MEMORIAL

The new committee on the Davis memorial was having just about the same amount of trouble in getting funds for that purpose as had the committee on the Rush memorial in the last quarter century. Only six states had contributed to the fund, and the total on hand was only a little over $700.

DEFENSE OF MEDICAL RESEARCH

The Committee on Defense of Medical Research had developed some excellent papers on animal experimentation, among them contributions by E. L. Trudeau on tuberculosis, James Ewing on cancer, James R. Angell on the ethics of animal experimentation and W. W. Keen on surgery.

Again the Constitution and By-Laws were completely revised and new arrangements made for a constitution and by-laws for the individual states.

ANESTHESIA

A committee on anesthesia had been developed to conduct extensive studies in this field. It concluded that ether was the anesthetic of choice for the general practitioner and for all anesthetists not especially skilled.

A NEW BADGE

In 1910 the Association discarded its insigne which included a red cross and adopted the emblem which is still used. In developing the design the committee suggested that it convey a definite meaning both in color and in form. Scarlet and gold had been considered medical colors since ancient times; the true ancestral symbol of the healing art was the knotty rod and serpent of Aesculapius. One member of the committee wanted an eagle on the emblem, but other members were opposed to the eagle and it was omitted.

NEW SECTIONS

Petitions came for a new section on physical forces in medicine and for a new section on urology and venereal diseases.

The House of Delegates endorsed the statistical and editorial work of THE JOURNAL leading toward control of Fourth of July fatalities and casualties.

COUNCIL ON LEGISLATION

Now came the organization of the Council on Legislation, Health and Publicity, to consist of five members elected by the House of Delegates on nomination by the President.

SECTION ON GENITOURINARY DISEASES

The committee recommended the establishment of a section on genitourinary diseases; the first officers appointed for that section were Drs. W. T. Belfield, Chicago, chairman; James Pederson, New York, vice chairman, and Dr. Hugh Young, Baltimore, secretary. The reference committe did not believe, however, that the time was opportune for the establishment of a section on physical forces in medicine or for a section on hospitals. These came later.

RATING THE MEDICAL COLLEGES

The House of Delegates authorized publicity for the rating of medical colleges in the United States, and the first rating of class A, B and C colleges was published. This publication was to be of vital significance in eliminating the weaker medical schools and in raising the standards of all the medical schools in the United States.

Again there were calls for elimination of the office of coroner.

DEATH OF RICKETTS

In this year Dr. Howard Taylor Ricketts died while undertaking investigations into typhus in Mexico; the House of Delegates adopted a memorial in recognition of his death, and THE JOURNAL published important editorials on the significance of his work.

The women's committee made an extensive report on its activities. This was referred to the Reference Committee on Hygiene and Public Health.

SIMMONS REELECTED SECRETARY

When the time came for the election of secretary, a movement began to force Dr. George H. Simmons to retain the office. The movement was successful and he was unanimously elected.

NEW SPECIAL PERIODICALS

As the session ended, the Board of Trustees was encouraged by the House of Delegates to proceed with the publication of a journal of pediatrics and of surgery whenever it should think desirable. Some members feared that the publication of these special periodicals would involve losses to the Association, although there was unanimous agreement on the desirability of good scientific periodicals for the encouragement of the specialties. In discussion, Dr. George H. Simmons made it clear that the one purpose of these special periodicals was advancement of the specialties concerned. He said "I believe that we can do nothing that will help scientific medicine in this country so much as the publication of high class scientific journals that private publishers cannot publish, even though it may be done at a loss."

THE BATTLE WITH THE PROPRIETARIES

Behind the scenes were rumblings and turmoil that reflected the activities of the "patent" medicine interests which were trying to disrupt the Association. A communication had come from Dr. G. Frank Lydston insisting that the American Medical Association had no right to meet or to elect trustees or officers outside the state of Illinois. He hinted at procedures by the state's attorney unless his demand be followed. The letter from Dr. Lydston was laid on the table.

A resolution had been developed that there be further modification of the Constitution and By-Laws to make members of county and state medical societies members *ipso facto* of the American Medical Association, and the Board of Trustees was requested to draft a suitable amendment for the purpose. The final action taken with regard to the women's educational committee was to refuse to make any grants for the payment of work of that committee. It was also decided that every committee, council, officer or bureau entitled to funds submit a detailed budget before making expenditures.

1911

LOS ANGELES

The payroll of the American Medical Association as 1911 came on the scene included 23 salaried monthly officers and about 100 other employees in the clerical and mechanical departments. The average wages of printers varied from $20 to $30 a week and of the clerical employees about $15 a week.

By this time the Association was becoming a little touchy on the work of Dr. J. N. McCormack, who was receiving a salary of $6,000 a year for his organization and legislative work. Officially he was employed by the Council on Health and Public Instruction and not by the Board of Trustees. Dr. Alexander R. Craig had been employed as assistant to the secretary. A motion was passed that a periodical to be known as the American Archives of Surgery be published beginning with 1911.

ADDRESS BY DR. WELCH

When the Association convened in Los Angeles in 1911 Dr. William H. Welch made an address to the House of Delegates, contrasting the effectiveness of its actions with those of the general meeting in a previous era. Because of the great importance of actions taken by the House of Delegates he emphasized the desirability of selecting the most competent possible representatives for membership in this body.

IMPROVEMENT IN ORGANIZATION

In further development of the compact and efficient organization that he sought for the American Medical Association, Dr. George H. Simmons recommended a technic for transfer of membership when a physician changed his location. He suggested also a reorganization of the Judicial Council as a permanent body authorized to hold meetings when necessary to consider such questions as the secret division of fees, contract practice and advertising.

During the year the Association had moved into its new building.

COUNCIL ON HEALTH AND PUBLIC INSTRUCTION

The first report of the Council on Health and Public Instruction was made by its chairman, Dr. Henry B. Favill of Chicago. This distinguished body included, in addition, Drs. Walter B. Cannon, J. N. McCormack, Henry M. Bracken, W. C. Woodward and a full time employee, Dr. Frederick R. Green, as secretary. Special bureaus devoted to legislation, organization, publicity, protection of medical research and public health had been established under the Council. Under its auspices addresses had been made throughout the nation, publications had been devoted to the defense of research, legislation had been studied in the national Congress and in the states, bulletins had been issued to the press on a great variety of subjects, and pamphlets had been issued through many state boards of health and of licensure. For instance, the special committee on public health education announced that over 2,800 lectures had been given to more than 230,000 people. Subcommittees considered in addition such subjects as visual standards for pilots, the prevention of blindness due to ophthalmia neonatorum, amblyopia from methyl alcohol and trachoma. There were reports on blindness due to industrial accidents and faulty eye hygiene.

THE JUDICIAL COUNCIL

The reorganization of the Judicial Council was recommended in some amendments to the By-Laws.

Once the Judicial Council was officially established, the President appointed to its membership Dr. Frank Billings, Illinois; James E. Moore, Minnesota; A. B. Cooke, Tennessee; Alexander Lambert, New York, and Hubert Work, Colorado.

MEDICAL EDUCATION

The Council on Medical Education reported a reduction in medical colleges from 166 in 1904 to 129 in 1911. There were still, however, vast fields to conquer.

AMENDING THE PURE FOOD LAW

The Association was urging the Congress to amend the Pure Food and Drug Law so as to prevent false statements in regard to the results to be expected from the use of medicinal agents.

The House of Delegates urged the Council on Medical Education to inform the public concerning the status of medical education and the quality of medical colleges, utilizing the forces of the Council on Health and Public Instruction for that purpose.

For the first time the Council on Medical Education recommended the desirability of a five year instruction program, one year of which was to be spent as an intern. The Council urged that medical colleges be requested to adopt such an internship as rapidly as possible.

SECTION ON HOSPITALS

A proposal came for the establishment of a scientific section on hospitals.

ALBERT ABRAMS EMERGES

While the Board of Trustees was meeting in Los Angeles, it received a remarkable letter from Dr. Albert Abrams of San Francisco in regard to a review of a book printed by him on the subject of spondylotherapy. The book had been somewhat unfavorably reviewed in THE JOURNAL, and the editor had refused the advertising pages of THE JOURNAL to the book. Dr. Albert Abrams threatened to bring suit unless the Board of Trustees reversed the action of the editor. The Board of Trustees approved the action of the editor and of the chairman of the board, Dr. M. L. Harris, in refusing space to Dr. Abrams. The subsequent career of Dr. Albert Abrams in the field of electronic medicine, an unusual form of quackery, indicated the wisdom of this early action in recognizing that he was about to depart from honest medicine into the field of fraud and charlatanism.

THE PHARMACOPEIA

Through its representatives to the U. S. Pharmacopeial Convention the Board of Trustees was initiating action to remove from the U. S. Pharmacopeia preparations of doubtful value. To this meeting of the Board of Trustees came a request from the Council on Pharmacy and Chemistry for funds to be devoted to research in therapy; the Board of Trustees gave its full support to this proposal.

ARCHIVES OF SURGERY

A special committee had met in New York to consider the publication of the ARCHIVES OF SURGERY and was proceeding with its plans, but it felt that a far more elaborate publication was needed than was then contemplated.

THE N. S. DAVIS HALL

As a memorial to Dr. Nathan Smith Davis, the Board of Trustees during this year established the library in the Association building as the N. S. Davis Hall and directed that a bronze bust of Davis be placed therein, the expense of this bronze bust to be paid for out of the Davis fund.

DR. CRAIG MADE SECRETARY

Dr. Alexander R. Craig had become secretary of the Association, and the Board of Trustees fixed his salary.

1912

ATLANTIC CITY

The Association had grown so large and the number of its sections so numerous that it now became necessary to restrict the amount of material published. Up to this time every paper read in a section and approved by the executive committee of the section was published in THE JOURNAL. Moreover, the discussions were lengthy and often of little merit. The Board of Trustees now suggested that discussions published in THE JOURNAL be limited to 500 words and that every possible effort be made to get the executive committees of the sections to limit the length of the papers and to withhold their approval from those that did not represent high quality.

ARGUMENT OVER A SURGICAL PUBLICATION

Now came a petition from 100 of the most prominent surgeons of the country requesting the Board of Trustees to proceed with the publication of the journal of surgery. At the same time, however, came another letter signed by Dr. Lewis S. Pilcher, editor of the *Annals of Surgery,* and Dr. Franklin H. Martin, editor of *Surgery, Gynecology and Obstetrics,* earnestly protesting the establishment by the Association of such a journal. They feared the publication of such a periodical, saying it "would practically put us out of business and leave the field of independent surgical journalism of this country to be occupied solely by journals of a less high scientific character." They said further "We believe it more in keeping with the high purpose of the American Medical Association to foster and forward the honest efforts of its members in the line of medical progress rather than to cripple or destroy them by unnecessary competition."

After hearing these two communications, the Board recommended that a surgical journal be developed along lines similar to those established for the ARCHIVES OF INTERNAL MEDICINE and the AMERICAN JOURNAL OF DISEASES OF CHILDREN.

DR. JOHN B. MURPHY MAKES NEW PROPOSALS

The meeting of the House of Delegates in 1912 brought forth a long address to the House by the President, Dr. John B. Murphy, dealing wholly with the work of the organization and making some revolutionary proposals as to its conduct. These included the breaking up of the Council on Health and Public Instruction so that the functions in regard to medical legislation would go to another council. He wished also a council on organization to be concerned with membership of the Association. He recognized the quality of THE JOURNAL but thought it ought to do much more in the way of answering inquiries and giving information to the medical profession. He made a brilliant attack on fee splitting and felt that the Principles of Ethics should be much more definite in its condemnation of this dishonest practice. He urged clinics in connection with the meetings of the Association. And he desired particularly that the House of Delegates check the actions of the Board of Trustees, councils, committees and officers to make certain that they were carrying out the requests of the House. He wished to have the President, the secretary and the editor made ex officio members of the Board of Trustees without voting power, and he urged also that provision be made to give to the House of Delegates complete information as to the action taken by the Board. This action was taken by the House of Delegates and has not been subsequently changed.

NEW COMMITTEES

In the meantime a number of committees appointed through actions of the House of Delegates were studying problems of great importance to the advancement of American medical science. For instance there was a committee to represent the American Medical Association at the third National Conservation Congress. There was a committee on nomenclature and classification of diseases which was conducting systematic studies on this subject. Another committee was concerned with standards in the field of anesthesia. Of this committee Dr. Yandell Henderson was chairman, and at this session of the House of Delegates Dr. Thomas S. Cullen, Baltimore, was appointed to the Committee on Anesthesia. Another committee had been established to consider the completion of the Panama Canal.

The Board of Trustees was able to announce the first publication of its book "Nostrums and Quackery," enlightening the public on frauds and quackeries; more than 10,000 copies had been promptly exhausted.

The Judicial Council, under Dr. Frank Billings as chairman, presented an extensive list of rules for its own procedures. It recommended revisions of the Constitution and By-Laws to improve still further ethical standards of the profession. These amendments concerned particularly the patenting of drugs and instruments, the maintenance of membership being made dependent on conduct in accord with the Principles of Ethics. The Council condemned the secret division of fees and the giving of commissions and urged amendments as well regarding contract practice.

NEW SECTION ON ORTHOPEDIC SURGERY

As evidence of the growth of scientific work in the Association there came a request for the establishment of a section on orthopedic surgery and another for a section on physical therapeutics. There had come previously a request for a section on proctology. The House of Delegates established the Section on Orthopedic Surgery but rejected sections on both physical therapeutics and proctology.

THE SCIENTIFIC EXHIBIT

The Scientific Exhibit was growing in quality and in the total number of exhibits, but it was feeling itself a stepchild in the assignment of space at the annual session, and the House of Delegates moved that it be given first choice of location in the exhibition hall.

A JOURNAL OF HEALTH AGAIN PROPOSED

The meeting of the Association of 1910 had heard a recommendation from the President of the Association for the publication of a journal of health. This had finally reached the status of a special committee under Dr. William A. Evans, Illinois, to investigate the possibility of publishing a health journal. The committee urged the Board of Trustees to establish a popular priced health journal. The recommendation was referred to the Board of Trustees of the Association by the House of Delegates. The board replied to the House that, if the House wanted the publication, the board would proceed. Not until 1923 was this objective accomplished.

A JOURNAL FOR GENERAL PRACTITIONERS

In his address to the Association Dr. William H. Welch had suggested the desirability of publishing a small medical journal, because THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION was too advanced and too technical for many practitioners. There were at that time 278 medical journals published in this country, many disgraceful to the profession that supported them. The report of the special committee to consider this matter was prepared by Dr. J. N. McCormack. He believed that the best method for meeting the objective would be encouragement by the American Medical Association to the state medical journals and aid to all periodicals conducted in accordance with reasonable rules as to plain honesty in their advertising and reading pages. The committee felt also that the American Medical Association might well aid these smaller publications through providing them with abstracts of the more scientific articles that appeared in the technical publications, of which there were so many in the field of medical science. As a result of these considerations THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION undertook at that time the publication of a weekly bulletin of abstracts of important medical articles. This bulletin was sent regularly to smaller medical publications. By the use of these abstracts in the smaller medical journals the advancement of medical science was regularly extended to great numbers of physicians who would otherwise never have come in contact with medical progress.

COUNCIL ON HEALTH AND PUBLIC INSTRUCTION

Again one of the most extensive reports was that of the Council on Health and Public Instruction. This body was clearly attempting functions which, in the light of present day practices, would be grouped under the heading of public relations. It conceived its principal commission to be the development of public confidence in the purposes and work of the American Medical Association and of the medical profession. It conducted a press bureau and a speakers' bureau. It compiled a handbook for speakers. It organized and developed a bureau of literature concerned with the publication of great numbers of bulletins and pamphlets. It distributed educational matter on frauds and nostrums and it enlightened the public on medical legislation. It encouraged membership in the American Medical Association, aided the campaign against the antivivisectionists, collected state laws related to health, offered prizes for the best cartoons on public health subjects and distributed a bulletin, published occasionally, to county and state medical societies regarding the work of the American Medical Association and of this council. The number of its committees was great. They included subjects as profound as resuscitation for electric shock. It had a special committee which cooperated with the National Education Association and a committee on medical expert testimony, on railroad sanitation, on vital statistics and on similar subjects. It participated with the Council on Medical Education in a joint annual conference on medical education and legislation, and all of its subcommittees, such as those on the prevention of blindness, visual standards for pilots, public health education among women, cooperation with the National Education Association and uniform regulation of membership, made special reports. Unfortunately the evolution of the work of the American Medical Association in succeeding years resulted in the lapsing of the work of this council, so that some years later it was discontinued by the House of Delegates and its various functions distributed among such agencies as HYGEIA, the Bureau of Investigation, the Bureau of Health Education, the Bureau of Medical Legislation and the Bureau of Exhibits. The special functions having to do with education of the public regarding medical legislation by the use of a speakers' bureau and special publications in that field lapsed entirely until the creation of the Council on Medical Service and, most recently, of a Bureau of Public Relations.

By an action of the House of Delegates taken at this session, the courtesy of the floor of the House of Delegates was extended to the members of the various councils and particularly to the secretaries of these councils so that they might advise the House at any time concerning their work.

DR. J. A. WITHERSPOON MADE PRESIDENT

At the elections on the fourth day of the annual session Dr. J. A. Witherspoon of Nashville, Tennessee, was elected President unanimously.

PRESIDENT JACOBI'S ADDRESS

One of the suggestions made by President Jacobi in his annual address dealt with the desirability of reforestation of the United States as a means of preventing floods. This recommendation was referred to a reference committee of which Dr. Hubert Work of Colorado was chairman. That committee recommended that the American Medical Association urge the Congress of the United States and the individual states to take immediate steps in the direction of extensive reforestation of the country and thereby to protect the country in the future against the return of similar calamities. This recommendation was adopted. A good many years later Hubert Work became Secretary of the Interior in the cabinet of President Coolidge. But reforestation began to be taken seriously by our government many years later!

Unusual at this session was a valedictory address by Dr. Abraham Jacobi to the House of Delegates. Some of his remarks were received with great appreciation of his wit. For instance, he said:

> I want you to understand that I am not used to presiding over such a body. I have done the best I could under the circumstances and I have just followed my instincts and what I have seen in inferior places. I am not used to it, because this is a queer place. There is no second and third term where people learn to be disagreeable and make people's lives uncomfortable. So you must excuse me perhaps for not having made things more uncomfortable for you.

He urged particularly that the American Medical Association develop great strength in order to secure the establishment of a department of health in the cabinet. He concluded:

> You want to get home. What I wanted to say was this, that our main position in life should be to wake up our neighbors, particularly the general practitioners, that vast number of men all over the country, and see to it that they participate in public affairs.

During the session of the House of Delegates the Board of Trustees again considered the publication of a health journal but decided that this was much too serious a proposition to be undertaken suddenly. Dr. Simmons was requested to look into the matter. He was never especially desirous of undertaking such a publication and it was not actually begun until just previous to the end of his term as editor. The Board of Trustees referred to the Council on Health and Public Instruction the question of publishing a health journal, and that council said it was not yet ready to give any advice on the subject.

MEETING OF STATE SECRETARIES

A motion was made before the Board of Trustees to provide for an annual meeting of state secretaries at the time of the meeting of the Board of Trustees in October.

GUIDES FOR THE SCIENTIFIC EXHIBIT

The Scientific Exhibit had grown so greatly that the board approved the appointment of guides, who were paid $5 a day, to show doctors around the exhibit.

NEW BUTTONS FOR OLD ONES

A decision was finally made that the button carry the letters A. M. A. and not the entire name of the Association. Then it became necessary to trade in the old buttons for the new buttons, and that had to be settled.

The attorneys of the Association rejected the proposal that the President, secretary and editor of the Association should be members of the Board of Trustees without the right to vote as being a violation of the corporation law of Illinois.

1913

MINNEAPOLIS

The year 1913 was to witness some fundamental changes in the conduct of the work of the American Medical Association resulting in part from the loss of personnel and, secondly, from evolutionary progress. The amount of material coming to THE JOURNAL increased so greatly that the Board of Trustees recommended to the House of Delegates that no more sections be created and, second, that no more than thirty papers be read in any one section. Furthermore, a special approval slip, to be used by the executive committees of the individual sections, was developed so that the executive committee could sign its endorsements for publication. It was felt also that the changing of the secretaries year by year was inadvisable and that they ought to have more permanent office. Finally it was suggested that the secretaries of the sections be assembled at least once each year at a conference and that their expenses be paid for such a conference.

BIRTH OF THE COOPERATIVE ADVERTISING BUREAU

Out of the recommendations that came from the J. N. McCormack committee came a motion to create a bureau of advertising to aid the periodicals that wished to conduct themselves in accord with the principles of the councils of the American Medical Association. The editor and general manager, Dr. George H. Simmons, and the advertising manager, Mr. Will C. Braun, were requested to prepare an outline for such a bureau and to report to the Board of Trustees at a later date.

AN OTOLARYNGOLOGIC JOURNAL

Now came also a request for the American Medical Association to undertake the publication of a periodical in the field of otolaryngology. The disputes that arose over the publication of a surgical journal had now completely blocked progress in that direction, and it was moved that a special committee be set up to study the whole question.

At the end of the February meeting of the Board of Trustees the board authorized Dr. George H. Simmons to take a vacation of ten or twelve weeks during the year. He postponed the vacation until the period following the annual session which was held in 1913 in Minneapolis.

MORE ADVICE FROM DR. JACOBI

The President of the Association, Dr. Abraham Jacobi, had devoted his official address to the question of the prevention of infant mortality. To the House of Delegates when it opened its meeting in 1913 he spoke more definitely of the work of the organization. He felt that the sections could do a better job if they had fewer papers and if the papers could be gathered in symposiums which would draw together the opinions of leaders and, he concluded, "We write too much and debate too little." He urged that the secretaries of the sections be prominent scientific men in the profession and that their term of office be lengthened. He felt that the President of the Association did not have enough to do and that aside from sitting with the Board of Trustees he might well sit with other councils and other agencies of the Association. This suggestion met with great approval by the House of Delegates, which adopted an action to the effect that the President of the Association be asked to attend all meetings of the councils, bureaus and similar bodies in the Association. Dr. Jacobi was moved by the fact that those who attended the House of Delegates simply lost touch with the scientific work of the organization, and he felt that something might be gained if the House would meet for three days previous to the time of the annual session. As President he had received some letters complaining about the "oligarchy of Chicago and the autocracy of the House of Delegates." He said "If my angry correspondents would pray less and watch more, and would interest themselves in their county and state societies and in the election of their various delegates, they would have less reason to complain of what some of them term the oligarchy of Chicago and the autocracy of the House of Delegates." He was particularly annoyed by the fact that he had received some "epistles of rebuke and expostulation" and that he had "to put up with the wiseacres who were members of no societies and even with those who were not yet citizens of the country." And, he said finally, "If you had the benefit of an Ellis Island of your own you would have fewer undesirable citizens of the profession, fewer backbiters, fewer calumniators of persons and aims, fewer enemies of the profession and fewer conspirators."

By this time the American Medical Association had reached a membership of 34,283, but THE JOURNAL had become the primary force in securing membership in the Association.

The recommendations of the Board of Trustees relative to the management of the sections met with a fine welcome from the House of Delegates, which supported the board fully in lessening the number of papers, extending the terms of the secretaries and urging more careful consideration by the executive committees of the sections of the papers that came to them.

The board announced that it was setting up a cooperative medical advertising bureau in the Association headquarters and that it had established a conference of state secretaries. All members of the Association had received copies of the Principles of Medical Ethics, and the publications of the Association were doing very well indeed.

FEE SPLITTING

In an endeavor to determine the status of fee splitting, the Judicial Council had sent a questionnaire to prominent members of the profession throughout the nation. It found great variations throughout the country in this practice. The full report on fee splitting is an extraordinarily interesting document. After discussing every possible phase of the subject, the Judicial Council adopted a resolution to the effect that any member of the American Medical Association found guilty of fee splitting—of giving or receiving division of fees—should no longer be a member of the Association. It also recommended definite action toward the elimination of the abuse of so-called lodge practice. As a part of its report to the House of Delegates at this time the Judicial Council also suggested the desirability of change in the procedure of the House of Delegates by the election of a speaker who would be responsible for conduct of the affairs of the House of Delegates. The chairman of the Judicial Council which brought in this report was Dr. Alexander Lambert. The Judicial Council included in its membership Drs. A. B. Cooke, James E. Moore, Hubert Work, George W. Guthrie and the secretary of the American Medical Association.

The report of the Judicial Council went to the House of Delegates, which decided to consider the question of speaker by the entire house sitting as a committee of the whole. The House considered the matter of the speaker as a committee of the whole, but there is nothing said in the minutes as to what it did. The other recommendations of the Judicial Council relating to fee splitting were adopted.

The Council on Health and Public Instruction presented again an extensive report of its many activities, which had proceeded along the lines laid down in previous years, and announced a similar program for the year to come. It proposed the establishment of a legislative and medicolegal bureau at the headquarters of the American Medical Association. One of the proposals was a conference of the executive officers of public health organizations to discuss mutual cooperation and proper division of the field. The Council had worked out carefully a long list of organizations interested in public health to which an invitation for a conference was sent. That conference had been held at the American Association for Labor Legislation on April 12 and officers representing thirty-nine national organizations were present. As a result of that conference a committee of fifteen was established to consider the entire question of public health activities and the ways in which they could be improved and to report its findings with definite recommendations at a subsequent meeting of the conference.

Among the men on this committee was Dr. S. M. Gunn, whose name appeared at the meeting in 1946 as a maker of the Gunn-Platt report in an effort to coordinate philanthropic organizations related to health and to standardize in some way health activities.

Conspicuous in the activities of this council were its contacts with the government. Much of its work during the year had been devoted to a method of bringing about harmonious cooperation between the Council itself and the special committee on national legislation which had been established by the House of Delegates and the committee of 100, which was concerned with public health problems. It is interesting to observe seven points in the program of this group:

> First: Appoint a committee to see President Wilson, tomorrow, May 6, at 10:45, and communicate to him the results of our conference and request him to decide on an administration policy concerning public health legislation.
>
> Second: Recommend to President Wilson that he definitely advocate the establishment of a Department of Health.
>
> Third: That he cooperate with Representative Foster in attempting to secure a Committee on Public Health in the House of Representatives during the present special session.
>
> Fourth: That he call a White House conference on Public Health next fall somewhat similar to the Governors' Conference on Conservation called by President Roosevelt. The object of this conference is to promote the success of the President's policies and if necessary to aid in framing these policies.
>
> Fifth: That at the next regular session the President should send a special message favoring public health legislation or else emphasize it in his regular annual message.
>
> Sixth: That the President should select for the first assistant Secretary of the Treasury some one interested in public health.
>
> Seventh: That in the next regular session we should support the President in securing such public health legislation as he decides to recommend.

The extensive reports of this council deserve to be read in detail by every one who is concerned today with the whole problem of public relations for American medicine.

EDUCATION

The Council on Medical Education continued to make its routine reports of progress toward further standardization of medical education.

The American Medical Association was functioning in relationship to the American Red Cross through a liaison committee.

An attempt had been made to arrange a joint meeting between the American Medical Association and the British Medical Association, but some of the members of the committee had died and the matter was still under consideration.

Already the committee which was working on the establishment of a national department of health was having a little trouble by the fact that the U. S. Public Health Service was trying to divert that activity into an expansion of the U. S. Public Health Service. The committee remarked

> We, the undersigned, cannot see any virtue in pretending to be for a Department of Health directly and then covertly attempting to get it by an expansion of the great Public Health Service.

The committee that signed that communication included Drs. J. B. Murphy, J. N. Hurty, W. C. Woodward and W. A. Evans.

The House of Delegates had at this time to clarify the functions of the Committee on Health and Public Instruction and the national department of health. It did not agree with the committee that the Association maintain a paid lobbyist in Washington. It did not concur in the idea that the American Medical Association join with other organizations of a purely commercial nature to maintain a lobby in Washington. This report, which was extensive and which was made by a committee consisting of Drs. E. J. Goodwin, chairman, A. R. Mitchell and Thomas S. Cullen, was adopted. There was much debate, during which the House of Delegates went into executive session. The minutes of the executive session are not available, but at the end the House of Delegates adopted a report placing the responsibility in the Council on Health and Public Instruction and recommending the discharge of the special committee on national public health legislation.

Out of the work of the Reference Committee on Amendments to the Constitution and By-Laws came an action which made it mandatory that a member present only one paper at any annual session.

DR. VICTOR VAUGHAN BECOMES PRESIDENT

At this meeting Dr. Victor Vaughan of Ann Arbor, Mich., was elected President of the American Medical Association. The House of Delegates had great pleasure in hearing an address by Mr. Samuel Hopkins Adams, who spoke on medical advertisements in the public press. The House of Delegates authorized the establishment of the Cooperative Medical Advertising Bureau. It created a new Section on Gastroenterology and Proctology and selected as its officers Drs. Joseph M. Mathews, Louisville, Ky., chairman; J. A. McMillan, Detroit, and A. J. Zobel, San Francisco, secretary.

The Board of Trustees at this session voted not to support a periodical on the ear, nose and throat because the time was not opportune.

DEATH OF E. E. HYDE

After the session ended, Dr. George H. Simmons departed for a trip abroad. During his absence Dr. E. E. Hyde, assistant to the editor, died suddenly of myelogenous leukemia. Following his death, Dr. Malcolm L. Harris, chairman of the Board of Trustees, served as editor until Dr. George H. Simmons returned.

At the meeting of the Board of Trustees in November 1913 Dr. A. R. Craig, secretary of the Association, presented a report in which he called to the attention of the board the loyalty of every one connected with the Association following the death of Dr. Hyde and during the absence of Dr. George H. Simmons. In the meantime Dr. George H. Simmons had secured the services of Dr. Morris Fishbein to take the place of Dr. Hyde. Dr. Fishbein had been recommended by Dr. Ludvig Hektoen and Dr. Frank Billings and had begun his work with the American Medical Association on Aug. 27, 1913.

The Board of Trustees now again took up the question of the Cooperative Medical Advertising Bureau and reaffirmed its original action in establishing this committee and making an appropriation for its work.

In creating the Section on Gastroenterology and Proctology, a motion had been made to the effect that the two existing societies in that field would disband. Apparently, however, these societies did not disband, and the secretary of the Association did not feel that he could create the section unless the societies did disband. Dr. Dwight H. Murray of Syracuse appealed to the Board of Trustees, which felt, however, that it could not go beyond the action of the House of Delegates.

Dr. G. Frank Lydston had carried to the courts his desire to force the American Medical Association to hold its meetings and elections in Illinois, so that the trustees authorized publication of the Lydston decision in THE JOURNAL under the authority of the Board of Trustees, to be signed by the secretary and chairman of the board.

1914

ATLANTIC CITY

Because the number of papers at the annual session had been reduced, the restriction of four pages to a section paper was modified now to permit six pages.

The headquarters office was permitted to expand into the old building which it had been renting to outside parties because the needs of the Association were continually growing.

Now began a battle over the rental and use of radium, which has continued until this date.

COMPULSORY SICKNESS INSURANCE LOOMS LARGE

In 1913 the American Medical Association began to be interested in the question of sickness insurance. The Council on Health and Public Instruction conceived the desirability of sending one of its employees, Dr. I. M. Rubinow, to Europe to study what was being done there in national health legislation. The Board of Trustees did not think the time was ripe to undertake such studies. An American Academy of Medicine had been formed, and the secretary of that group wanted the cooperation of the American Medical Association in studying medical sociology. This action was referred by the Board of Trustees to the Council on Health and Public Instruction.

At the meeting in Atlantic City the President of the Association, Dr. John A. Witherspoon, announced that he would not make any address because he had just got up from the sick bed.

SECTION TROUBLE

The secretary of the Association reported his troubles over the Section on Gastroenterology and Proctology. The majority of the members of the American Proctological Association were opposed to disbanding when interviewed and indicated that they were not in sympathy with the formation of the section. The Reference Committee on Sections and Section Work, chairman Dr. Hugh Cabot, recommended therefore that there be no Section on Gastroenterology and Proctology. It recommended the division of the sections into two groups—general and special—with the understanding that a member might read one paper before each of these two groups. It recommended finally a committee of five be appointed by the President and be charged with the investigation of the whole matter of sections and section work. The committee had been asked to create a section on hydrotherapy, but it did not feel it desirable to add any more sections.

BOARD OF TRUSTEES REPORT

The Board of Trustees began its report by saying that the past year had been distinguished by no unusual events in the Association. All the activities had been prosecuted with maximum interest to the medical profession. There was trouble because Arbuthnot Lane had recommended Russian mineral oil, and the Council on Pharmacy and Chemistry had found no difference between Russian mineral oil and the liquid petrolatum of the United States. A book had been published called Useful Drugs. Quacks were moving the nation into activity, and the national organization had established vigilance committees to work toward the elimination of frauds in medicine. A special department known as the propaganda department had been established in the headquarters of the organization under the leadership of Dr. Arthur J. Cramp.

The Council on Medical Education reported ten years of excellent progress. It was about to investigate proprietary graduate medical schools and it urged reorganization of the clinical departments of medical schools. A complete arrangement had been made for full cooperation with the American Red Cross.

The Council on Health and Public Instruction again defined the scope of its activities. It recommended, however, as a new activity a survey of public health activities of the federal government to determine exactly what the federal government is doing for public health. The speakers' bureau had sent speakers throughout the nation to cover a wide variety of subjects, which were carefully tabulated. The press bulletin and the bureau of literature had been continued. There was a complete survey of national and state legislation. Somewhat in advance of its time was the report on special activities. This report follows:

> The Council conceives one of its most important functions to be the cultivation, as the official representative of the Association, of friendly relations with other professional organizations and influential bodies. The problem before the Association is exactly that which confronts the individual; namely, the necessity of convincing those whom we would influence of our sincerity and good faith. In a word, the Association and the medical profession, like the individual, must acquire and maintain a reputation for breadth of mind and charity of spirit, as well as for ability and authority in its special field. If we have the confidence and cooperation of the public and if they recognize the honesty of our purpose and sincerity of our motives as a body, almost anything which we may propose will meet public approval. If, on the other hand, the public is suspicious of our motives and skeptical as to our disinterestedness, any proposition emanating from the organized medical profession, no matter how clearly for the public good, will be misunderstood and criticized. The existence of a permanent body with a definite policy and a constant attitude of friendliness toward other organizations is therefore of the utmost importance. The Council feels that, during the short period of its existence, gratifying progress has been made in this direction and that the Association and its activities are gradually coming to be understood and appreciated by intelligent and broadminded citizens.

CANCER

The subcommittees had been effective in their work. A new subcommittee was that on cancer, headed by Dr. Thomas S. Cullen as chairman, and it had begun a series of articles for enlightenment of the public on many phases of cancer.

PATENTS

An attempt had been made to secure participation by the American Medical Association in the holding of patents on medical devices, and the Board of Trustees was requested to look into the matter in cooperation with the Judicial Council.

THE AMERICAN COLLEGE OF SURGEONS

At this time also there came before the House of Delegates information regarding the formation of the American College of Surgeons, with a resolution from the state of Illinois deprecating this organization. The resolution was laid on the table, as was another substitute resolution to the same effect.

The House of Delegates encouraged the Council on Health and Public Instruction to correlate existing national health organizations in the manner proposed and to make the necessary surveys of the health activities of the federal government.

TWO NEW IMPORTANT ACTIONS

As the year went on, the Board of Trustees took two actions of great significance. First it decided to publish a series of monographs on anesthesia for the general information of the medical profession and for the advancement of knowledge of this subject. Next it created a reserve fund containing $125,000 as a first instalment, which was to grow and grow as the years went on.

(To be continued)

Clinical Notes, Suggestions and New Instruments

RENAL OSTEODYSTROPHY

COL. JAMES S. NORMAN
LT. COL. ROBERT PERLMAN
and
CAPT. STEPHEN BASTABLE
Medical Corps, Army of the United States

Extensive bone changes may occur in some patients who show evidence of chronic uremia. The chronic uremic state may be associated with congenital anomalies of the kidneys and the urinary ducts, congenital hydronephrosis, chronic cystic diseases of the kidneys and chronic interstitial nephritis. Renal osteodystrophy or renal rickets is seen uncommonly in children and rarely in adults. Amongst many thousands of troops examined in the orthopedic clinic of a large army station hospital, 1 case of renal osteodystrophy in an adult was discovered.

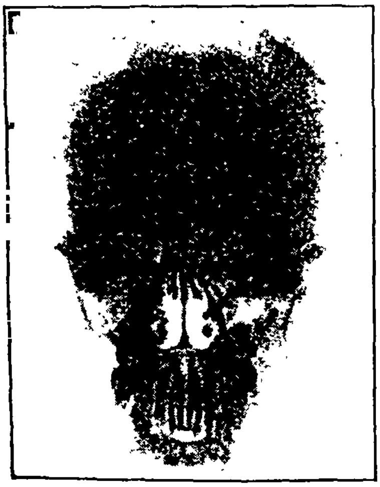

Fig. 1.—Anteroposterior view of the skull reveals fine stippling. There is a defect about 1 cm. in diameter in the lower posterior quadrant of the right parietal bone.

REPORT OF CASE

History.—V. J., a white man aged 20, was admitted to the orthopedic section of an army hospital on March 14, 1944. During a routine examination in February 1944, preparatory to overseas service, the soldier was referred to the orthopedic clinic because of the presence of unduly prominent clavicles. The patient was without subjective complaints. He revealed that at the time of his examination for induction into the army in February 1943, he was informed that his collar bones were very prominent. Roentgenographic studies in the outpatient department revealed changes in the skeleton which led to his admission to the hospital for further study.

The past history of the patient disclosed that he had had the usual childhood diseases. In response to questioning, he stated that for five years prior to this admission he had observed that he lacked energy. For this reason he shunned all athletics. Also for the past five years he noted nocturia once a night. He served as a private secretary in civilian life. He was a clerk in the army and carried on in a satisfactory manner in this capacity. He showed a high degree of intelligence. The family history was noncontributory.

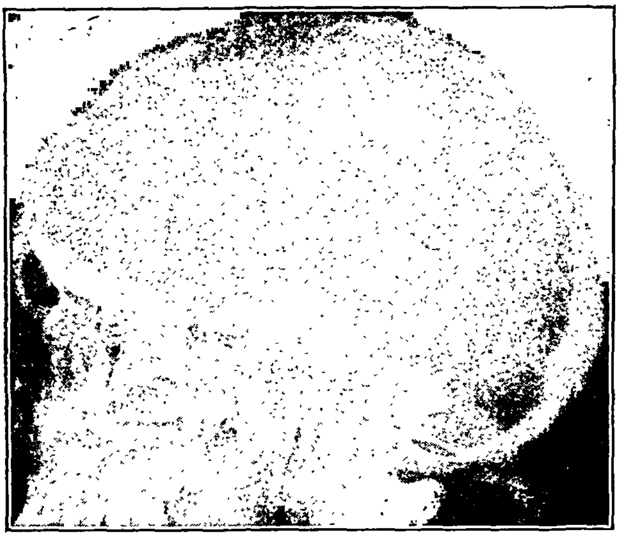

Fig. 2.—Lateral view of the skull reveals fine stippling and osteoporosis. There is a well defined calcification in the region of the choroid plexus of the left third ventricle.

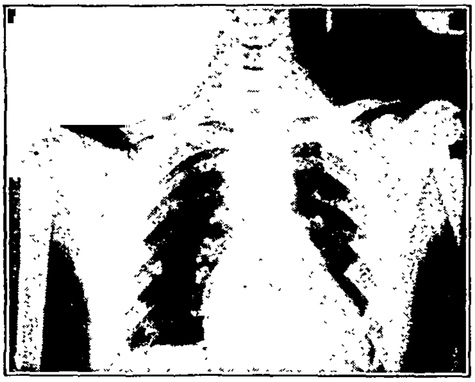

Fig. 3.—Anteroposterior view of the thoracic cage; the epiphyseal disks of the upper ends of the humeri are open. There is slipping of the humeral heads. Calcification at the acromioclavicular and sternoclavicular joints is delayed.

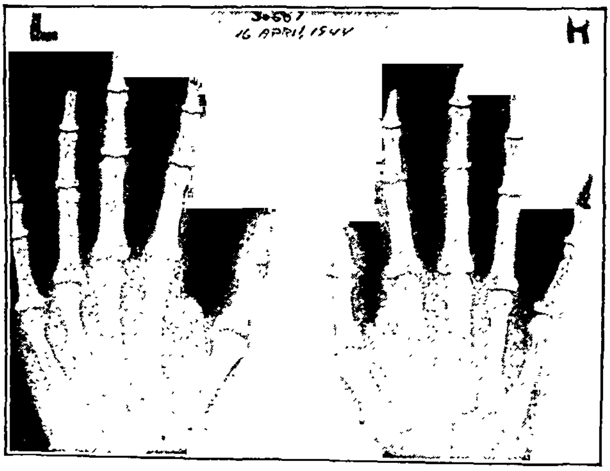

Fig. 4.—Anteroposterior views of the hands revealing calcification of the blood vessels of the thumb and fingers. There is palisade-like periosteal new bone formation in the middle phalanges.

Physical Examination.—Physical examination revealed an alert, cooperative white man. He did not appear ill. He was pale, blond and asthenic. His temperature was within normal limits. The pulse rate averaged 88 per minute and the respiratory rate 18 per minute. The blood pressure was 136 systolic and 84 diastolic. The examination of the head revealed that the skull was large and increased in its anteroposterior diameter. The eyes were prominent but definite exophthalmos and abnormal eye signs were absent. The report of the ophthalmologic consultant revealed that under dilatation each lens was observed to have a small, centrally placed "powder cataract" of the variety known as "cataracta pulverulenta centralis." This was a biconcave disk located in the fetal medeus and made up of small shiny white dots fused together to form a disk. The center of this disk was clear. There was also a clear zone between the capsule and the opacity. The opacities were bilaterally symmetric and about 3 mm. in diameter. In the periphery of each retina was a nondescript pigmentary retinal degeneration consisting of small, brownish gray pigment blotches distributed all around the posterior segment in the form of a girdle. Visual field studies were normal. The teeth failed to show abnormalities. Masses were not palpable in the neck. The sternoclavicular joints were prominent, giving the clavicles an unusually prominent appearance. The examination of the heart, lungs and abdomen failed to reveal abnormalities. Neurologic examination was not noteworthy.

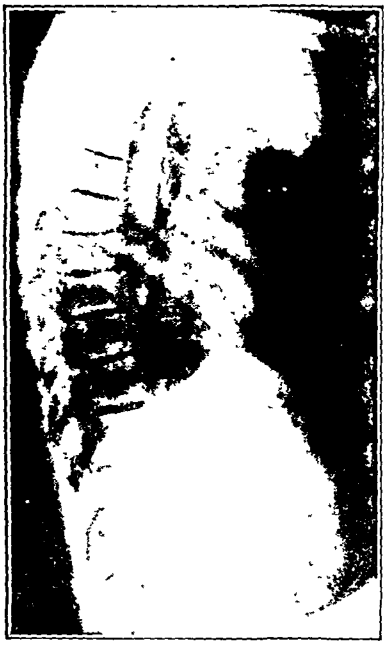

Fig. 5.—Lateral view of the dorsal spine reveals slight exaggeration of the dorsal kyphosis. There is wedging of the body of the sixth dorsal vertebra. There is narrowing of the intervertebral space and irregularity of the adjacent margins of the bodies of the sixth and seventh dorsal vertebrae. The configuration of the remaining vertebral bodies appears normal.

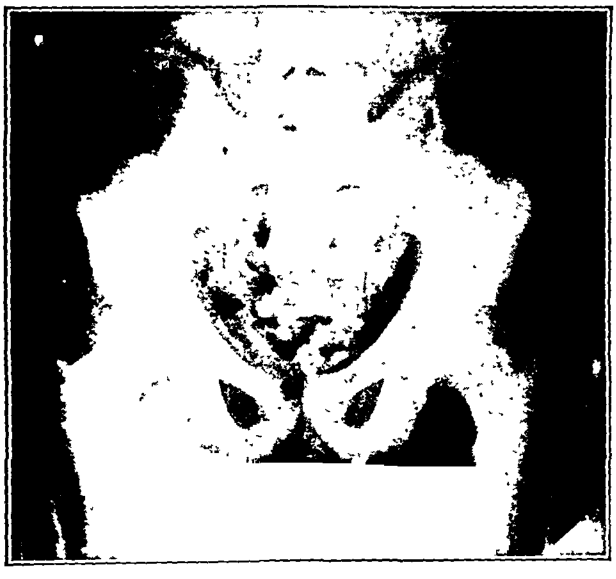

F. 6.—Anteroposterior view of the pelvis reveals calcification of the epiphyses of the iliac crests are open. Both uzzy and the margins are indistinct. There is erosion in the regions of the ischial tuberosities and the pubic bone near the symphysis pubis. One upper femoral epiphysis appears closed whereas the opposite one is incompletely fused. The femoral heads appear mushroomed.

Laboratory Data.—Urine: Urinalysis revealed the presence of albumin in all specimens. The highest specific gravity determination was 1.009. The phenolsulfonphthalein test showed elimination of 8 per cent of the dye in four specimens.

Blood: Examination of the blood revealed: red blood cells 4,600,000; hemoglobin 90 per cent; white blood cells 9,400 with a differential count of segmenters, 77 per cent; stabs, 16 per cent; eosinophils 2 per cent, and mononuclears 5 per cent. The Kahn test was negative. The blood level of sugar was 100 mg.; calcium 10.4 mg.; phosphorus 6.9 mg., and nonprotein nitrogen 100 mg. per hundred cubic centimeters, with 76.5 mg. on another determination. The level of urea nitrogen was 50 mg.; creatinine 2.5 mg.; cholesterol 175 mg.; total protein 7 Gm.; albumin 4 mg., and globulin 3 mg. per hundred cubic centimeters.

Spinal Fluid: On examination of the spinal fluid, manometric studies revealed normal pressure. The Wassermann test was negative. The level of sugar was 63.3 mg. and of total protein 33 mg. per hundred cubic centimeters. The lymphocyte cell count was 3.

Roentgenographic Examination.—Roentgenograms of the entire skeleton, thorax and abdomen and retrograde studies of the urinary tract were made during the period from Feb. 28, 1944 to April 16, 1944. Comparison of serial films failed to reveal essential changes in the lesions indicative of progression or regression of the process.

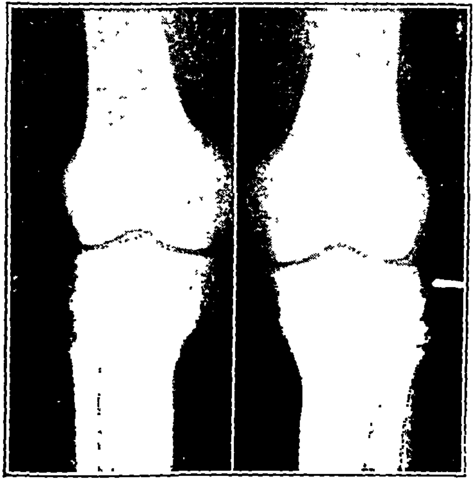

Fig. 7.—Anteroposterior views of the knees reveal erosion of the upper tibial metaphyses on the medial aspect.

Reproductions of roentgenograms of various parts of the skeleton are seen in figures 1 through 9. The study revealed mild decalcification particularly in the skull and the tibias. Diploe was not seen in the calvarium. An approximately circular defect 1.0 cm. in diameter was seen in the lower posterior quadrant of the right parietal bone. Similar smaller defects were observed elsewhere in the skeleton. Osseous erosion was seen in the metaphyseal area of the upper inner aspects of both tibias and in the region of the ischial tuberosities. Most of the epiphyseal cartilages were closed. The epiphyseal cartilages of the upper ends of the humeri were open and there was slipping of the upper humeral epiphyses. The epiphyseal cartilages of the iliac crests were open. One of the upper femoral epiphyseal cartilages was not completely fused. The femoral heads had a slightly mushroomed appearance. The acromioclavicular and sternoclavicular joints appeared widened and a considerable part of these adjacent bones were not calcified. This change was also observed in the region of the symphysis pubis. The sacroiliac joints were hazy and indistinct. Calcification was seen in the vessels of the hands, feet and pelvis. Palisade-like periosteal new bone formation was apparent in the middle phalanges of the fingers. Retrograde renal studies revealed a very small right kidney pelvis, the lower and middle calices of which retained their cupping, but the upper calyx was not clearly outlined. The left kidney pelvis was larger and presented good cupping of its calices. The lower third of the left ureter was slightly dilated. The right kidney shadow was 7.5 cm. in its long axis and the left was 10.5 cm. in the same axis. Evidence of renal calculus was absent. The liver and spleen were not enlarged. The psoas shadows were symmetric.

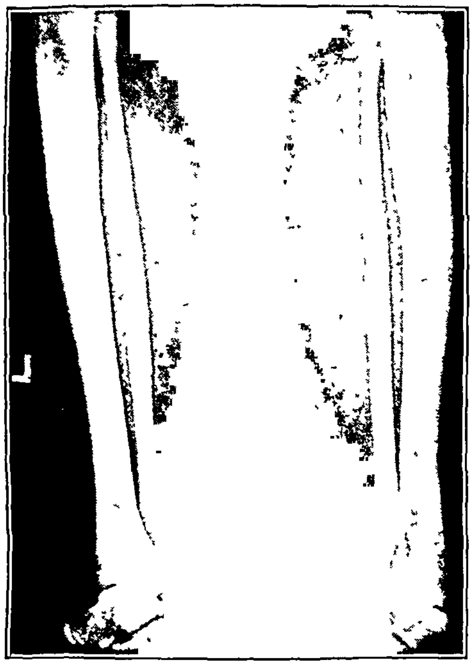

Fig. 8.—Lateral views of the legs reveal evidence of mild decalcification. There are localized areas of rarefaction of the bone.

COMMENT

On completion of these studies and establishment of a diagnosis this soldier was discharged from the Armed Forces. The roentgenographic and laboratory studies established the diagnosis of renal osteodystrophy. This term is used in preference to renal rickets or renal hyperparathyroidism because of the widespread skeletal manifestations of the pathologic process and because the case was not followed beyond the stage recorded. Most cases have been in young adults and children who show congenital dilatation of the ureters and renal pelvis or congenital hypoplasia of the kidneys complicated by a chronic nephritis as in this case, or it may be due to chronic glomerulonephritis and calculous pyelonephritis after puberty. These patients may manifest polydipsia, polyuria, dry skin, headache, anorexia or delayed sexual development. Their stature may be small. Pronounced renal failure occurs associated with an increase of nonprotein nitrogen, acidosis and hyperphosphatemia. Parathyroid hyperplasia may develop in these cases. The changes shown on the roentgenograms have been demonstrated in previously recorded cases. Calcium deposits in the neighborhood of joints have been recorded by others but were not seen in this case. The palisade-like periosteal new bone formation seen in the phalanges of the hand is an unusual feature.

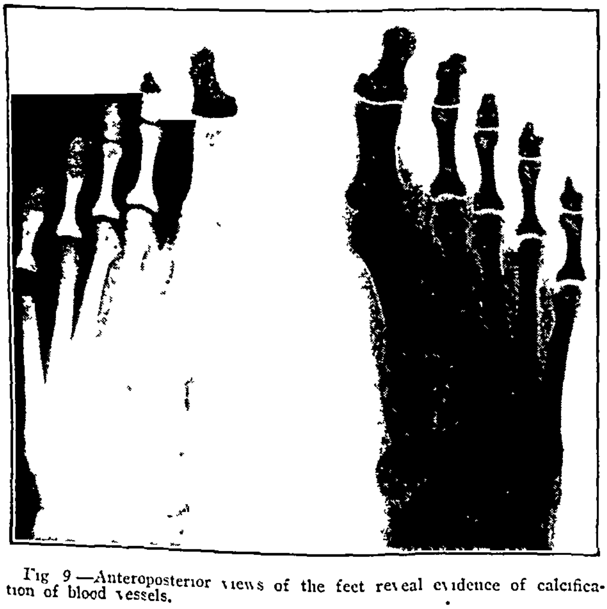

Fig. 9.—Anteroposterior views of the feet reveal evidence of calcification of blood vessels.

The skeletal changes are considered to result from impaired absorption of calcium from the intestine. Phosphates, eliminated from the intestines in large quantities, combine with calcium to form insoluble calcium phosphate, resulting in considerable loss of calcium and decalcification.

SUMMARY

Attention was directed to a case of renal osteodystrophy in an adult by the presence of unduly prominent clavicles. The patient showed evidence of a chronic uremic state with azotemia and hyperphosphatemia. The roentgenographic changes demonstrated were mild osteoporosis, stippling of the skull, delayed ossification at the epiphyseal cartilages in some areas, slipped humeral epiphyses, metaphyseal erosion, palisade-like periosteal new bone formation and calcification of the media of arteries.

Council on Physical Medicine

The Council on Physical Medicine has authorized publication of the following report. HOWARD A. CARTER, *Secretary.*

CONTRA DIAPHRAGM ACCEPTABLE

Manufacturer: Contra Creme & Diaphragm Company, Severna Park, Md.

This product is a vaginal diaphragm which may be prescribed by a physician for patients when he believes contraceptive measures are indicated. It is designed for use with a spermicidal cream that has been accepted by the Council on Pharmacy and Chemistry and was described in New and Nonofficial Remedies, 1946, page 360. The Council on Physical Medicine stated its requirements for acceptability of contraceptive devices in THE JOURNAL, Dec. 21, 1946, page 991, and the product hereinafter described is accepted as meeting those requirements.

The Contra Diaphragm consists of a domelike lamina of rubber bounded by a torus shaped rim. The rim contains a ring of spirally wound, cadmium plated piano wire; the ends are joined without soldering, and the ring is rolled into the rubber. The substance of the diaphragm and rim is made of 60 per cent solids—liquid latex rubber dipped five times. The thickness of the rim is 4.5 mm., and its flexibility is such that 460 Gm. of weight compresses it to 60 per cent of its original diameter. The overall diameter, expressed in millimeters, is used to specify the size, and ten sizes are supplied, progressing by 5 mm. steps from 50 mm. to 95 mm. The diaphragm is packaged with a 65 Gm tube of Contra Creme in a plain box with slip label only.

Evidence of harmlessness and efficacy has been furnished by competent medical investigators specializing in gynecology and obstetrics. Data have been submitted showing a satisfactory shelf life and use life. The company has agreed to stamp date of manufacture and date of warrant expiration on each package.

The directions warn against the use of oils, state that Contra Creme is to be used with the diaphragm, give adequate instructions about cleaning, advise inspection for holes and tears, and recommend fitting by a physician. The advertising matter is acceptable.

The Council on Physical Medicine, on recommendation of the Consultants on Contraceptive Devices, voted to include the Contra Diaphragm in the list of acceptable devices.

SATURDAY, MARCH 15, 1947

HOXSEY—CANCER CHARLATAN

Of all the ghouls who feed on the bodies of the dying, the cancer quacks are most vicious and most heartless. This statement was made in The Journal of the American Medical Association and in *Hygeia* some years ago as a comment on Norman Baker, notorious cancer quack of Muscatine, Iowa, who subsequently was convicted and confined to the penitentiary; shortly after his release, he died. Among those who were associated with Baker was Harry M. Hoxsey. He now appears on the medical scene again, this time in Dallas, Texas, endeavoring to promote a treatment of cancer by methods distinctly those of the charlatan.

The effrontery and brazenness of the cancer charlatan can hardly be equaled by any other exploiter of the weakness and credulity of mankind. Apparently, Harry Hoxsey was able to obtain a visit to his cancer clinic in Dallas by U. S. Senator Elmer Thomas of Oklahoma; he is now circulating throughout the nation a transcript of the proceedings of that visit. He has been able to get a commission appointed in Oklahoma consisting of state legislators and senators, who it is said will visit his clinic and pass on his technics. The action of the joint legislative committee of Oklahoma is unparalleled in recent history, although some Ohio legislators almost a century ago tried to pass on a cure for asthma. According to newspaper reports the Oklahoma legislative committee consists of five senators and five house members who will make the junket accompanied by Dr. Grady Mathews, health commissioner. Dr. Louis H. Ritzhaupt of Guthrie, Okla., who is a Fellow of the American Medical Association and a surgeon, according to the newspapers, told the state legislature that he thought the medical profession of Oklahoma "was open to any suggestion" and said he was sure that "scientific minds would be willing to go into the treatment" and offered no objection to the committee making the trip.

Here is the record of Harry Hoxsey. It has an aroma that smells to high heaven. It has been published on several occasions in The Journal of the American Medical Association. It is amazing that any physician anywhere would lend himself to any recognition of Hoxsey.

The father of Harry M. Hoxsey, one John C. Hoxsey, a quack now dead, used to dub himself "doctor." Hoxsey senior dabbled in veterinary medicine, faith healing and cancer curing. Around 1910 he was indicted with two others by the Montgomery County (Ill.) grand jury on the charge of attempting to blackmail a dentist of Litchfield. Following the indictment, Hoxsey senior disappeared but the two conspirators were convicted and punished. Hoxsey senior avoided arrest for some months; then he was jailed until he furnished the $5,000 bail required. He died in 1919, and the cause of his death ironically was cancer.

Following the death of Hoxsey senior, nothing further was heard of his alleged cancer cure until 1924. Then Harry M. Hoxsey, the son, formed a common law trust with the title "National Cancer Research Institute and Clinic." The declaration of trust stated that Harry Hoxsey was the "owner and possessor of a secret formula for the compounding of a treatment for cancer" and that this treatment was "something entirely new in medicine." Bear in mind that this was 1924; more than twenty-two years have elapsed since Harry Hoxsey launched it on the public. Certainly if it possessed any merit whatever in the treatment or cure of cancer that fact would long since have been established.

By 1925 Hoxsey's associates had eliminated him from the National Cancer Research Institute and they had joined with another cancer quack, one Lester Tilton of Clinton, Iowa, in a new piece of fakery known as the "United Cancer Institute." That one died in 1926. Hoxsey then showed up at Taylorville, Ill., where he got the whole chamber of commerce in Taylorville interested in establishing a cancer cure sanatorium.

The Hoxsey cancer cure at that time, as proved by the Laboratory of the American Medical Association was essentially the escharotic treatment of cancer with arsenic as the base. After The Journal of the American Medical Association published information about Harry M. Hoxsey and the Hoxide Institute, suit was entered against the American Medical Association and its editor for a quarter of a million dollars. The suit dragged on and on until the Association itself insisted that it be brought to trial in December 1928. The court then entered an order dismissing the suit.

In the meantime the Taylorville institution had closed its doors and the newspapers reported that eight brothers and sisters of Harry Hoxsey were suing him for $500,000 in an attempt to recover a share of the estate left by their father; apparently the only asset in that estate was the alleged formula for a cancer cure.

Next we hear of Hoxsey as being associated with Norman Baker of Muscatine, Iowa, who sued the American Medical Association for a quarter of a million dollars for calling him a quack. This case was heard in the Federal Court at Davenport, Iowa, in 1932;

the jury unanimously decided that the American Medical Association was quite justified in what it had written about Norman Baker. In that case, which was tried in 1931, Harry Hoxsey himself was called to the stand. Hoxsey testified at that time that he was 30 years old and that his education had not even extended through the eighth grade. He then worked as a coal miner. In 1921 he went into the cancer cure business at Taylorville, Ill. He testified that he went to Muscatine, Iowa, with Norman Baker in March 1930 and stayed at the Baker Institute until Sept. 4, 1930 on a percentage contract basis. He admitted that he treated many patients and even used the hypodermic needle and gave some injections. On cross examination it was brought out that Hoxsey and Baker had had a disagreement because Baker was using some other treatments besides the Hoxsey treatment. It was brought out on the stand that a Dr. Statler once cut a woman's breast under the direction of Hoxsey and that in another case Hoxsey himself cut the breast and the patient died five days later. It was also brought out that another patient went to the Baker Institute where Hoxsey started to treat him. When the young man left the Baker Institute he went to the State University of Iowa Dermatologic Clinic, where they found he was not suffering from cancer but from "barber's itch."

Later Hoxsey promoted his cancer cure in Atlantic City, Philadelphia and other places. For a time he headed an alleged cancer clinic in Detroit, where he hired a renegade physician to help him evade the medical practice act of that state. When he came in conflict with the authorities, he left that state. In 1932 he was heard from in Wheeling, W. Va., in connection with a Hoxie Cancer Clinic. Soon after opening this clinic he was arrested and held under bond. Next he moved to Atlantic City, N. J., where he interested some laymen in financing his cure. Still later he was tied up with the Spann Hospital in Dallas, Texas, and after that with the Bryan and Peak Cancer Clinic. In 1941 Hoxsey was fined $25,000 and court costs and sentenced to five months in jail for practicing medicine without a license. That sentence, however, was reversed by another court.

In October 1945 Hoxsey appeared at the National Cancer Institute with three congressmen to find out whether or not the National Cancer Institute would investigate his cure. A letter from the National Cancer Institute reads:

> Mr. Hoxsey seems to have a persecution complex and stated that he had been treated very unfairly by the American Medical Association many years ago. He says you thought his remedy to be something worth while and would have taken it up if he assigned over to you personally the entire rights.

This statement is of course an outright falsehood typical of the misrepresentation, chicanery and deceit that characterize the actions of charlatans.

Apparently Harry Hoxsey in his performances in Dallas, Texas, is being aided by osteopaths, who are licensed to practice medicine in that state. Apparently he has been successful in hoodwinking and deceiving eminent jurists and other important persons to the extent that they have given him tacit if not actual support. Apparently his performances and his success have caused him to believe that it is now possible for him to exploit widely his method of treating cancer and that he can "get away with it."

Because of the nature of cancer, it is among the most dreaded of all diseases. People with cancer are willing to try any kind of treatment that is offered by almost any agency. The quacks claim to cure many persons of cancer and in some instances bring support from people who believe that they have been cured, when the diagnosis has never been made by scientific methods.

Harry Hoxsey has had more than twenty years in which to prove such virtues as might have existed in his method. Such proof has never been forthcoming. The American Medical Association has from time to time published the records of more than forty cancer charlatans who have offered their methods to the American people since 1900. These methods have included injections of innocuous mixtures of water and inert salts, caustic pastes and even more bizarre quackeries. Not one of these has ever been able to prove that it produced benefit, and certainly not one has ever resulted in curing cases of cancer. How long will the complacent authorities of such states as Texas continue to tolerate Harry M. Hoxsey?

EFFICIENCY IN MILK PRODUCTION

In times of national emergency attention is commonly focused on the adequacy of the food supply; the use of available grain and other plant sources of food for animal feed customarily is brought into question at such times. From the point of view of nutrition, meat and other animal products such as dairy products and eggs are attractive because of the flavor, concentration of nutrients and high biologic value. These nutritional advantages are obtained, however, at considerable cost in the course of transformation of nutrients from farm animal feed to the ultimate human food product. Thus it has been calculated that farm animals consume almost four times the food energy that is eaten by people and two and one-half times the grain that would suffice to support the food needs of the human population.[1] When animal feed supplies are scarce, nutritionists must determine the animal food product that represents the most efficient use of the animal as a converter of energy.

In a recent review of this topic, Maynard [2] has compared pork, milk, eggs, poultry, beef and lamb as representative animal food products, using several criteria as a basis for deciding which of these foods represents the best use of animal feeds. On the basis of percentage of gross feed energy recovered in the food, pork and then milk lead the list; when the number of feed units of concentrates needed to produce 2,600 calories (roughly a daily human requirement) is computed, milk is followed by lamb and pork in the order of efficiency. When the comparison is based both on the edible food protein per thousand calories of animal feed and on the percentage of feed protein appearing in the food, milk, pork and poultry stand out. A consideration of the minerals and vitamins produced for each thousand calories of feed in the six representative animal food products again emphasizes the relative superiority of milk on the basis of content of calcium, vitamin A, riboflavin and protein. The various comparisons made by the Cornell investigator support the claim of the dairy farmer for priority when animal feed supplies are limited.

The doctor was probably the first to recognize the unique dietary advantages of milk; progress in nutrition has confirmed this point of view and provided experimental evidence for it. The foregoing observations on the efficiency of transformation of feed energy in the production of milk raises this food product to a new importance in the national program of nutrition.

ALLERGY IN THE PRODUCTION OF LESIONS IN DISEASE

In a recent discussion[1] of the allergic pulmonary reactions of Loeffler's syndrome it was recognized that this syndrome may occur under many allergic conditions. In a paper on the morphologic similarities of the lesions, presumably allergic in nature, of rheumatic fever, periarteritis nodosa and "other allergic syndromes" Bergstrand[2] adopts the explanation that the lesions in the joints, the heart, the blood vessels, the skin and other structures of rheumatic fever are caused by allergic reactions in which the antigen is derived from hemolytic streptococci. The vascular lesions may be much like those in periarteritis nodosa, and more or less transient lung infiltrations with eosinophilia occur in rheumatic fever.

As for periarteritis nodosa, there is direct experimental evidence of its allergic nature. Bergstrand describes 4 cases of asthma with typical transient pulmonary infiltrations, abdominal pain, diarrhea and nasal polyps, but the asthmatic features were the most conspicuous. Besides the usual asthmatic lesions, vascular changes occurred in the lungs and other structures like those characteristic of periarteritis nodosa and rheumatic polyarthritis. Foci of fibrinoid degeneration in connective tissue and granulomatous areas like those seen in rheumatic fever were present also. In the lungs were interstitial inflammatory changes, serous exudate, eosinophils and giant cells, also chronic proliferation and changes resembling those of rheumatic pneumonia. The importance of allergy in the genesis of lesions in disease appears to be perhaps greater than generally understood. The evidence at hand certainly indicates that in rheumatic fever, in periarteritis nodosa and in fleeting lung infiltrations the lesions result from allergic reactions.

The question whether eosinophilic granuloma of bone is allergic is now under discussion.[3] Of course the clinical manifestations depend on the place or places where the reaction is most pronounced as well as on the nature of the etiologic agent, that is the allergen. Whether an etiologic grouping of the allergic pulmonary syndromes can be made on the basis of the symptoms and the lesions is a question. It may well be that such allergies due to different factors may cause different lesions and a different clinical course.

Current Comment

GLUCOSE VS. ANOXIA

Consciousness may be prolonged in anoxia due to high altitude flying by the previous ingestion of glucose. Riesen and his associates[1] of the Yerkes Laboratories of Primate Biology, Yale University, made studies on volunteers who were given a supplementary feeding consisting of 80 Gm. of dextrose dissolved in 350 cc. of water with or without the addition of 1 Gm. of vitamin C (ascorbic acid), two hours after a meal. Control feedings were made with 0.2 Gm. of saccharin substituted for the dextrose and with citric acid substituted for ascorbic acid. After an interval varying from thirty to eighty minutes, each volunteer was subjected to an anoxia test in an altitude chamber. The tests were based on handwriting criteria from a dictation ditty. Thus was determined the duration of "useful consciousness" at the reduced oxygen tension. In a typical experiment 39 control volunteers lost "useful consciousness" on an average at the end of 187.5 seconds in an anoxia test at 27,000 feet in the altitude chamber. In contrast, 38 volunteers previously fed glucose retained effective consciousness on an average for 261 seconds. This was a 40 per cent prolongation of "useful consciousness" as the result of preflight glucose feeding. Tests showed that the protection afforded flying personnel by the glucose solution is greater thirty to fifty minutes after its administration than after an interval of sixty to eighty minutes. Vitamin C, either alone or in conjunction with glucose, was without demonstrable effect on the prolongation of consciousness. These results confirm experimental evidence previously reported by

King,[2] Green,[3] Eckman[4] and others, who found that high carbohydrate diets increase aviation performance significantly, as determined by visual, psychomotor and mental performance. They suggested that high carbohydrate meals increase aviation performance because of the higher carbon dioxide yield together with a minimum metabolic need for oxygen (anaerobic tissue respiration).

GASTROENTERITIS ABOARD SHIP

Recently Meyers[1] reported a study of major outbreaks of "gastroenteritis" on ships sailing in the Pacific Ocean during 1945. The major episodes investigated were of three different types of approximately equal numbers: those caused by Shigella, by Salmonella and by unknown causes, probably a virus. Meyers believes that food intoxication due to staphylococci was fairly common, but because of the mild and short duration of this type of gastroenteritis few outbreaks were investigated. The majority of outbreaks of gastroenteritis aboard ship are preventable by proper supervision. The most common points overlooked include failure of routine inspection of hands of food handlers and prompt removal of all food handlers from duty who show any signs of illness; the use of contaminated sea water in the vegetable peelers and on the decks of the galley, butcher shop, vegetable preparation room and the improper technic of handling cooked fowl; holding food at galley temperatures too long, and absence of soap from latrines and inadequate cleansing of hands of those involved in preparing and serving foods. If a virus is suspected as an etiologic agent, measures to control respiratory illness should also be instituted, including isolation of all patients, if possible, checking the bunking arrangements and bunking space and avoidance of transfer of men ashore or to other ships unless absolutely essential. Apparently some types of "gastroenteritis" have been particularly serious among infants traveling by ship.

THE CONSTITUTIONAL FACTOR IN THE COMMON COLD

Data on upper respiratory infections occurring among 721 boys at the Phillips Exeter Academy during each of the academic years from 1935-36 through 1938-39 have been analyzed in a study of the stability of resistance. A total of 4,888 colds was reported. The boys were divided into six groups on the basis of years in residence at the school. Analysis of the data included the mean number of colds for each of the six groups, correlation coefficients grouped according to successive years and by one or two year intervals and analysis of variance. Each boy tended to have the same number of colds year after year; individual boys varied significantly from one another with respect to the number of colds experienced. Also for the period of the study individual boys tended to vary more than the variation existing between years. Sargent and his colleagues[1] consequently support the view that a constitutional or an environmental factor plays a significant part in the etiology of the common cold. Since the environment at Exeter Academy is relatively constant, they believe that the constitutional factor is the more probable element involved. The nature of the constitutional factor cannot be defined, but the evidence presented in this and other studies supports the recommendation of these investigators that future research on the common cold should embrace the physical and physiologic characteristics of the host.

BICARBONATE AND RENAL REGULATION OF ACID-BASE BALANCE

The important role played by the kidney in the regulation of acid-base balance has been repeatedly discussed.[1] This effect is manifest for example by the reabsorption of base, the excretion of acid phosphate and other acidic anions, the synthesis of ammonia and the formation of citric acid. The role of the kidney in regulating acid-base balance by another means, the reabsorption of bicarbonate, has recently been studied carefully by a group of workers at Cornell University.[2] These investigators followed the quantitative relationship between plasma bicarbonate concentration and the rates of tubular reabsorption and urinary excretion of bicarbonate. The results indicate that there is a rather definite "renal threshold" for bicarbonate of approximately 25 millimols per liter of plasma. Below this value practically all the bicarbonate in the glomerular filtrate is reabsorbed, whereas above the renal threshold value bicarbonate is excreted, the rate being the linear function of the plasma concentration. Furthermore, it was found that the reabsorption of bicarbonate per unit of time varies directly and proportionally with changes in the rate of glomerular filtration. Thus the renal bicarbonate threshold is relatively stable and nearly independent of the glomerular filtration rate. The quantitative efficiency of renal reabsorption was illustrated by a calculation showing that under ordinary conditions in which there is a need for base conservation in man 99.95 per cent reabsorption of bicarbonate may occur. In contrast, in case of base excess, bicarbonate excretion may be almost equally complete, as has been observed on certain therapeutic and experimental regimens in which more than 100 Gm. of sodium bicarbonate has been ingested and excreted per day. The renal reabsorption and excretion of bicarbonate therefore constitutes a primary mechanism whereby the body may defend itself against either loss or expansion of its alkali reserve and thus maintain its acid-base balance.

ORGANIZATION SECTION

NATIONAL CONFERENCE ON RURAL HEALTH

Second Annual Meeting, held in the Palmer House, Feb. 7 and 8, 1947

Dr. F. S. Crockett, Lafayette, Ind., Presiding

Friday, February 7

The conference was called to order at 9:45 a. m. by the Chairman, Dr. F. S. Crockett, Chairman, Committee on Rural Medical Service, American Medical Association.

Chairman Crockett: We doctors and farmers are trying to improve not only rural medical service but also rural health. Rural health embraces everything that will promote better living conditions, better living standards and better medical service. We doctors can give good medical service wherever the conditions make it possible.

We may here reach decisions based on our experience and wisdom and embodying the fundamental principles that govern the solution of each problem. To make our labors really fruitful, the farm groups represented here must inititate in each county where they have a chapter the activity that will obtain, through community action, the results desired. But it is at this community level where many times it is most difficult to create an active interest in health measures that will carry through to actual accomplishment.

There are farm areas in many states where the people do not earn enough to pay for good health measures. These areas have a problem different from others only in the economic phase. Some form of outside help is needed, but, whatever is done, the principle of self help should be emphasized.

Address of Welcome

Dr. George F. Lull, Secretary and General Manager, American Medical Association, Chicago: I want to tell you how much I appreciate your coming to Chicago to attend this conference. We feel that this material you are about to cover and which you have covered in the past is of vital interest to doctors all over the country, be they located in rural or in urban areas.

The Farmer and the Medical Service Program

Mr. Albert S. Goss, Master, the National Grange, Washington, D. C.: First let us look at the farmers' ability to pay doctors' bills under normal conditions. During the ten year period 1921-1930 the farmers' net income, as compared with nonfarm income, was $200 per capita as compared to $800 per capita for nonfarm people. During 1931-1940 it was $150 to $580. During 1945, which can hardly be considered a normal year, it was $740 to $1,260. You may raise the objection that the farmer has had free house rent and free food, but that is not true, for those items have been calculated and added to his cash income to obtain the income as I have given it. Thus we can see that the ability of the average farmer to pay for adequate medical service is substantially lower than that of nonfarmers.

On the average, farmers live a substantial distance from cities or towns where medical and hospital service is available. They cannot help that. The vocation of raising the food the nation needs requires some of us—lots of us—to live way off from "Main Street." Before the war in our thousand most rural counties there was only 1 medical doctor for every 1,700 people. In our big cities there was 1 doctor for every 650 people. In most rural communities there are less than 2 hospital beds per thousand people. In fact, 1,200 of our rural counties have no recognized hospital within their borders, and these counties have a total population of 15 million people. Hospital workers tell us that we should have 3.5 or 4 hospital beds per thousand rural people.

Let us look at the accident rate among farmers and those employed in industry. The accident death rate per hundred thousand workers on farms during 1945 was 53, as compared with 19 in manufacturing industries. When it comes to less serious accidents, but those still requiring medical care, farm experience will show that most farm workers have one or more such accidents every year. Even the farm children are exposed to innumerable hazards. In considering farm accidents we must not forget that the farmer who suffers an accident is usually far from a doctor or a hospital, while most industrial plants have medical service and hospitalization facilities on the premises.

For generations we have believed that our strongest and healthiest boys come from the farm. Figures released by the military service during the late war have awakened us with a rude shock. We found that the farm boy was not nearly so fit physically as the city boy. It was found in 1943 when 18 and 19 year olds were being drafted that, for the country as a whole, 25 out of every hundred were rejected, whereas for farm boys alone 41.1 boys per hundred were rejected. In addition, infant and maternal mortality rates are 25 to 30 per cent higher in rural than in urban communities.

We appreciate the need for maintaining high standards in the medical profession, but the fact remains that over a vast section of America the cost of medical service has increased enormously and the availability of service has become poorer and poorer. Whether rightly or wrongly, we believe it is a simple statement of fact that the feeling has become more and more general that the medical associations, instead of devoting their chief efforts to the improvement of medical standards, have been more interested in eliminating competition in the medical field. Certain it is that medical service is not only much more costly but much more difficult to secure, and rural America is rapidly getting up in arms over the inadequate service.

More and more people are turning to cooperative medicine. It has many advantages, not the least of which is adequacy. It is preventive in character. It is more economical and does not require that farmers be classified as paupers in order to secure adequate service at prices they can afford. It combines the advantages of the specialization of group practice with the efficient use of personnel and facilities. However, in many sections we have faced a storm of resistance on the part of the medical profession against every effort to organize cooperatively to improve conditions, although happily this seems to be diminishing.

I do not want to leave the impression that the physicians are solely responsible for an unsatisfactory situation. The health service, the schools and the farm organizations all have their responsibilities. The point I have tried to emphasize is that we have been trying to meet the situation by the cooperative medicine route but have not had much help; in fact, have met a good deal of resistance.

With the inadequacies of the service and the resistance against change, it is not surprising that more and more farmers are turning toward government help and state control of medicine, including compulsory insurance.

My organization does not believe in state control of medicine; we believe there should be a better way.

Summing up, there is a real problem which must be met if we are to avoid statism in medicine.

Methods of Bringing and Holding Doctors in Rural Areas

Dr. Fred A. Humphrey, Chairman, Colorado Committee on Rural Medical Service, Fort Collins; Member of the National Committee on Rural Medical Service: Before rural health can be intelligently discussed, some mutual understanding of what constitutes a rural community must be accepted. A rural community may vary in size from one with a radius of a few miles to one with a radius of 50 or more miles. Its population may vary from a few hundred to a few thousand persons.

It is generally conceded that there is no distressing problem of medical care and no difficulty in getting and keeping medical personnel in the more populous rural areas, so our attention and efforts can therefore be concentrated on the larger more sparsely settled areas, where neighbors are far apart, and towns which are large enough to support a doctor are widely separated. It is in such communities that it will be difficult to convince the younger doctor to locate and establish a practice. Some better system of professional, educational, religious, social and economic relationship will have to be established in order to hold doctors in such rural communities, once they have located there.

The two groups, working as a team, can furnish the necessary leadership to put into operation that part of the program which would apply to their individual area. No rules of procedure can be made which will not have to be revised to fit some unusual condition, since there are so many diverse types of rural areas in the United States. A specific program drawn to the measurement of conditions found in the corn belt of the Middle West would of necessity need some revision to meet the entirely different type of person and occupation present in the cotton belt of the South or the mining areas of either the Eastern or the Rocky Mountain states. However, a start must be made and a general plan outlined which is flexible enough to allow the changes needed to meet the different conditions found in the various sections of the United States.

In drawing up such a plan, the first things to consider are the changes which should be made by the individual farmers and business men in the small towns which will increase their chance of having a doctor locate in their community. The suggestions made are not unreasonable or difficult of accomplishment. More time, money and energy should be spent on such things as good roads, especially from farm to market, improved sanitary conditions, safer water supply and storage and similar local projects than in trying to get a hospital located in their community under the provisions of the Hill-Burton act. Such a hospital should rightfully be located only after a scientific and practical interpretation of a thorough survey of hospital and health needs. The many "ghost towns" scattered in the mining areas of the Mountain states do not present a pleasant picture, but an even more depressing sight would be "ghost hospitals" appearing over the United States in the next few years because of poor judgment now in choosing their locations. If a town and its surrounding trade territory is large enough to support a doctor adequately and wishes to have one, then every effort should be put forth by its citizens to obtain that desire. The initiative is squarely in the lap of the local people, and to secure the goal they may have to offer even further inducement such as the physical facilities which are so essential to a doctor if he is to care properly for the sick. In some cases it may be necessary to take still another step and subsidize the doctor on a monthly basis in order to make his income commensurate with his education and ability. Such subsidies should be financed locally, if at all possible, before application for state or federal aid is made. By all means, after a doctor has located in a rural community its citizens should show their loyalty to him by using him in case of illness and not go to the larger, but more distant, towns for their medical care.

Universal participation in prepayment insurance by farm people will be of definite assistance in bringing and keeping doctors in rural areas and should be incorporated in any plan devised for that purpose.

The medical schools of the United States should be asked to cooperate and join in the attempt to solve the rural health problem. There is no other instrument in organized medicine which can or should lend itself to such a service as easily and efficiently, but a definite program must be submitted to them which will enhance rather than jeopardize the prime purpose to which they owe their existence.

Other medical schools should follow the example of the Colorado university which has established a residency in general practice following the usual rotating internship of one year. In this residency the graduate will study six months each in medicine, in pediatrics, in obstetrics and gynecology and in surgery, with allied specialties included under the four main heads. After this training it is expected that the doctor will be capable of caring for better than 90 per cent of the patients coming to him should he locate in one of the small towns. Possibly other schools have instituted the same program. If not, they should be advised to do so.

Another change in policy which would relieve materially the present shortage of doctors in rural areas is the requirement of from three to five years in general practice before resident training is begun. Such a plan would be of great benefit to the individual by broadening his clinical knowledge and by giving him a better understanding of the difficulties encountered in general practice and a finer appreciation of the economic features involved. A doctor after such an experience would be more mature and better qualified to choose the specialty for which he has the greatest aptitude and in which he has developed the most interest. Later, should he wish to become certified, some credit should be given for the time spent in general practice. It would also be beneficial, at least in the immediate future, by opening many residencies which could be and would be filled by qualified men who have served in the armed forces and who are now attempting to obtain residencies in order to become certified by special boards. These men have seen the advantage in the last war, at least as far as rank is concerned, of being certified and have obtained their desire for special training partially from that observation. In many instances recent graduates of medicine and doctors returning to civilian life want only to be a specialist and have no particular aptitude or desire to practice a particular type of specialized medicine, as evidenced by their acceptance of training in some other field if the one of their first choice is not available.

The final suggestion to the medical schools originates from the statement "You can take the boy out of the country but you cannot take the country out of the boy." In the present condition of many applicants to medical schools to one admission a certain definite proportion of them should come from the rural areas. A boy who has been born and reared in or near a small town is much more likely to return to it than a boy who has experienced nothing but city life.

As methods of "Bringing and Holding Doctors in Rural Areas," suggestions have been offered both to the rural communities and to the medical profession. The recommendations to be carried out by the rural communities are:

That they build and maintain good roads from farm to market.

That they educate themselves on public health matters and put into practice known disease preventing measures.

That they improve their living conditions.

That they have in their area persons trained in first aid and home nursing.

That in some instances they furnish for the doctor the needed facilities, such as equipment and office headquarters; in some localities even a subsidy may be necessary.

That they apply to the proper agency of their state for assistance under the provisions of the Hill-Burton act if financial aid is required to carry on their program.

That they participate in prepayment insurance.

That they patronize their local doctor and whenever possible conserve his time by going to his office.

The recommendations to the medical profession are:

That they require three to five years' general practice before resident training is begun.

That certification boards give credit for such time spent in general practice.

That hospitals establish residencies in general practice.

That students from rural areas be encouraged to study medicine.

That hospital staffs be open to men in general practice.

That the system of medical care to soldiers be adapted to rural medical care.

That the rural practitioner be kept informed on advances in medical science by contact with other medical men at county medical society meetings and short refresher courses held in the rural districts.

Methods of Bringing and Holding Doctors in Rural Areas

MR. CHESTER G. STARR, Director of Rural Health, Missouri Farm Bureau: I recognize very keenly that the problems and conditions vary from state to state. The problems affecting California may be very different from those encountered in

Missouri, and those in our own state will undoubtedly be varied from those found in Minnesota. There are some problems more or less in common, such as trends in medical education, trends in nurses' training, federal aid in building hospitals and medical centers, farm income and like matters. However, often in many states, and I have found this to be true in my own state, the peculiar state problems may offer an opportunity for united action that may be secured before long range national issues can be solved.

The day when every Missouri hamlet had at least one doctor taking care of the farm families of the community has gone with the horse and buggy and will never return. We shall have to think and plan on large community units. At the low point in Missouri, when the armed forces were draining the better practitioners into their services, it was estimated that apart from our metropolitan centers there were not more than 800 doctors of medicine in rural Missouri. From that low point, according to information given me by the Missouri Medical Association, there are now in the same rural areas a total of 1,110 doctors of medicine, or a gain of 39 per cent over the low point. We are further encouraged to know that of about 150 doctors locating in Missouri this past year—over and above those returning to their former locality from the armed forces—98 of the 150 have located in some rural area. In a recent tabulation I found that twenty-six of our rural counties had at least 1 doctor of medicine for each 1,500 people, which I am told is a reasonably good ratio.

We also have some 600 osteopathic physicians in rural Missouri, and in many counties these persons have built a feeling of confidence and reliance on their sevices. There are ten of our rural counties that have at least 1 osteopathic physician to each 1,500 people. When we add both schools together, we come up with some interesting figures of having seventy of our rural counties, or 64 per cent, with 1 physician to each 1,500 people. In the tabulation, I found in one county that there appears to be 1 physician to each 430 people. Naturally, competition in that area is rather "hot."

The greatest problem in Missouri (and it is one requiring our attention) is the increasing age of the practicing doctors of medicine. Quoting again from the data kindly given me by the Missouri Medical Association, in 1946, 43.7 per cent of all rural doctors were above 60 years of age. Eight of our counties do not possess a doctor who is under 60; in eight more 75 to 99 per cent are over 60; in twenty-nine more from 50 to 74 per cent are over 60. Definitely, Missouri needs more young doctors to locate in rural areas, both to take the place of the older retiring or dying members of the profession and also to give us a total larger than that reported for this past year.

Not to be overlooked is the fact that doctors are human beings, some more human than others. They are not to be shunted here and there on the dictates of some power—at least not in these United States. Favorable conditions must be offered for any doctor to locate in any given rural area. As I view the situation, there are certain definite favorable factors which either must be secured as rapidly as possible or must already be existing in any area. I do not wish to take unnecessary time to go into details, but I would mention (1) a rather high level of income for the community, (2) a system of good roads, (3) good living conditions such as modern homes, good offices, good schools and good community life, (4) confidence in and use of local doctors by residents of the area, (5) hospital facilities in or nearby for diagnostic and treatment purposes, (6) modern health centers doing a good job of health education and (7) good enrolment in hospital and medical prepayment plans. If most of these advantages are present in any given community, a doctor hunting a location will be human enough to be attracted to it. If they do not exist there is little hope of having a voluntary location. The only remaining solution would be a system of either county, state or national subsidization to remove through public funds some of the disadvantages.

At present I believe that subsidization is the last recourse and would prefer greatly to endeavor to correct adverse conditions through voluntary action by all interested groups and persons.

The Responsibilities of the People

A good level of farm income is a direct responsibility of farm organizations and their members. I think that we can say without any person denying the fact that the major farm organizations have gone a long way in securing parity income for farm people and protecting them against adverse price situations. Also it can be said that the farm organizations will continue to be a considerable factor in retaining a decent farm income.

In Missouri the Farm Bureau has taken aggressive action in reference to the farm road situation. In the last session of the legislature the Farm Bureau and other interested organizations were taking money out of the surplus funds of the state for what is called "milk route" building. They are over and above our own state highway roads. They are not going to be quite the high class roads the state highways are, but we are expecting to spend somewhere around 4 to 6 million dollars a year for the next five years building roads from farm homes to the high class roads. While it will be impossible to have an all-weather road on every mile of the entire road system of the state, we are expecting to have a rather wide flung system that will enable practically every farm family to drive to the nearest community at any time in the year, barring ice and snow drifts.

As farm income continues at a good rate, better living conditions will naturally be found in rural areas and in small towns that live on rural business. Of course, at present, building supply shortages preclude much new building; but these will soon be corrected and small towns will have building booms in proportion to those of the large cities. It is definitely the responsibility of the people of any community to produce good living conditions.

The Medical Profession

I believe that there must be much more discussion with young doctors and those still in school concerning general practice. From the medical journals, from the medical school catalogues, from general medical discussion, too much emphasis is being placed on specialization. The instructors in many medical schools are specialists, command high fees for their outside work and naturally talk about their particular specialty as being the one to follow on graduation. Many medical schools, from information I have picked up, are strongly headed toward making specialists and actually discourage any student from being a member of the general practice group. I sometimes wonder if the specialization is not being carried to the point that good medical diagnosis is being badly overlooked for lack of some sane, well grounded physician to coordinate the findings of the many specialists. I also believe that, provided the medical education is overhauled, more young graduates might find lucrative and more enjoyable practice in some rural area being a general practitioner rather than battling for years in some city to establish himself as a specialist in this or that.

I am also thinking of a system of rural internships whereby those students who have either come from rural areas and retain their liking for rural life or those from towns and cities who might possibly be bitten by the "rural bug" would have an opportunity to become closer identified with rural hospitals and rural life. I wounder if we are going too far afield in this suggestion.

Definitely, a great deal of good could be done by aggressive county medical associations. Many of the shortcomings of the medical profession charged to it by many people and much of the unfortunate propaganda of recent years are due to the lack of aggressive leadership in health education by local doctors. In my work in Missouri I have often found some of the medical men in a county either lukewarm in supporting health improvement or even actively combating the movement. I don't want to be too specific, but I think I am going to use the illustration of one county in southeastern Missouri where a medium sized hospital is acutely needed. I have done considerable work in that county, and I am stymied by the active opposition of four doctors of medicine who are practicing in that county who have gone up and down the roads and have written letters saying that a hospital is not needed in that county; and the nearest available hospital is 40 miles away. I won't tell you the county. Some of our Missouri folks here know it. I do not wish to level this accusation against all county medical associations, but there is a decided lack of aggressive leadership in many areas. Possibly the American Medical Association and the state medical associations can overcome this fundamental difficulty and inculcate into many county associations a spirit of public welfare and leadership in worth while health movements. In this connection there has been in some areas a feeling that many people bypass the local doctors in many instances, going to large centers and to specialists, leaving the local doctor high and dry. In areas where there has been little attempt by the local doctors to participate in local affairs, especially in local health improvement, can we blame persons for not having confidence in their local physician?

Responsibilities for All Groups

There are some favorable factors in inducing doctors to settle and to remain in rural areas that are responsibilities of all. One of these, much in prominence today, is the matter of building or enlarging the doctor's workshop—the modern hospital. The people of any community will have little incentive to build a hospital unless the physicians and surgeons of the community are willing to practice in the hospital. No doctor or group of doctors can successfully build and operate a hospital unless the people of the community are willing to share in the expense of building and be patients when built. In the areas in Missouri where the Farm Bureau has successfully led movements for the building of modern county public general hospitals this past year the people and the doctors have worked together. In 1946 our people voted between two and a half and three million dollars for building new hospitals in rural Missouri. The same teamwork is needed in health education. In Missouri we have a new act by which people of any county may build and support public health centers. With the third horse, the State Division of Health, we are hoping to have many of our counties equipped with educational health centers.

The third part of the united responsibility is the encouragement of enrolment and use of the prepaid hospital and medical plans. Without the enthusiastic support of hospital management and the medical profession, the Blue Cross and other prepaid hospital plans would be tough sledding. Without the same vigorous support of the medical profession, a prepaid medical plan would be most difficult to make a success. Most rural people are rather closely tied to their family doctor—much more than the average city dweller. If the family doctor tells John or Mary that Blue Cross is good and that in case of illness or accident the medical service will undoubtedly pay for the costs and that he, the doctor, is a member of the Blue Cross and belongs and gives service under the medical plan, then John and Mary and many other Johns and Marys enroll in the prepayment plans.

Hospital Facilities and Health Centers for Rural Areas

Mrs. Roy C. Weagley, President of the Associated Women of the American Farm Bureau Federation of Hagerstown, Md.: Although the telephone and improved roads have made their contribution toward relieving the rural health situation, I think that with their advent rural health suffered from an exodus of rural physicians into the cities. For many years both the Associated Women and the parent organization, representing 4¼ million farm people, have been vitally concerned with the inadequacy of medical care and hospital facilities available in rural areas.

Our organization has promoted group health associations and hospital insurance as a means of securing more nearly adequate care at more equitable cost to rural people, but the progress of those plans has been impeded by the lack of facilities to service such plans, and the lack of facilities is greatly responsible for the lack of physicians and nurses in rural areas.

Opportunity for health in rural America equal to that enjoyed by people in urban areas can be obtained only through close cooperation between the various groups of our system and the medical profession.

Although metropolitan areas are in the main fairly well supplied with hospital beds for general medical care, many are planning to expand the present facilities by taking advantage of the national hospital construction act. This in some instances is unwise. In my opinion it would be far better to lighten the present hospital load than to expand facilities. I am not prejudiced to expansion as was the stout lady who deserted her political party because she was against expansion under any consideration. To relieve the existing pressure on overcrowded hospitals, health centers should be coordinated with them. Rural health centers should be established within reasonable distance from the existing hospital. Rural health centers would serve a dual purpose. They would lighten the load in the metropolitan area and they would bring medical care to many rural people. By establishing health centers in rural and needy areas, the effectiveness of the very limited number of medical and nursing personnel now rendering service in those areas could be multiplied.

With a well managed health center, the greater proportion of the approximately 20 babies born to each thousand of population in rural areas could receive adequate care. At the same time the lives of many babies during that first year could be saved. Many mothers too could be spared great suffering from complications.

Essential equipment must be provided for the practice of modern medicine, for the conduct of routine tests and for x-ray service. Without such facilities it is impossible to expect our trained physicians and nurses to consider working in the rural field. It is reasonable to believe, however, that with a better distribution of hospital facilities and health centers will also come a better distribution of physicians, nurses, dentists and medical care generally.

Experience has revealed that the quality of services can be raised by the use of consultants and the facilities of accessible hospitals. My interpretation of the purpose of the hospital construction act is to promote the building of hospitals and related facilities in proportion to the need. In other words, I would say that rural areas, where the needs are greatest, should be given first consideration; otherwise the maldistribution of medical and nursing personnel would be intensified rather than improved. Likewise, if the funds are used mainly for new construction and expansion of existing facilities in metropolitan areas, that would cause even greater disparity between rural and urban opportunities for medical and hospital care.

Construction of Hospitals

Mr. Lloyd C. Halvorson, the National Grange, Washington, D. C.: About all I have to report is what we have been doing in the National Grange. We have sent a letter out to all our state offices, sending them a summary of the hospital construction act, pointing out what responsibilities they can take on the state level to get the legislation through. We suggested that they might want to include state aid toward the construction of the hospital, possibly one third, which would leave only one third for the local community. We pointed out that they need a local hospitalization plan. In some states there will be a law to permit counties to go together and cities and counties to go together in providing the necessary money. Some of the people have written in to us, being somewhat familiar with the law and knowing there is money to spend, asking what procedure they should take. We have to report that as yet most of these states haven't progressed that far in their planning. In other words, as yet the hospital district center hasn't been set up, so we have referred them to the health department for the present. We have suggested that they get in touch with the health department and find out how far they have progressed; and also there might be some tentative plan as to what procedure a local community will have to go through to get this money. We have told our people to make sure that they have farm members. It will be important to farm people to know that they are given some recognition in the laws and procedures that will be laid out.

We have a great deal of hope in these rural health centers as a way of bringing doctors to rural communities. I think there is some fear on the part of the medical profession that these centers will not provide a high standard of medical care. I think that can be taken care of so that the really urgent cases can be referred to the bigger hospitals. When it comes to the rural community, of course, there may have to be some means to provide one third, or possibly two thirds, in operating the hospital.

Cost of Operating a Hospital

Dr. Robin C. Buerki, Dean, Graduate School of Medicine, University of Pennsylvania, Philadelphia; Member of the Federal Hospital Council: As a member of the Federal Hospital Council, at the first meeting I said I had an open mind on everything except one question and one problem; and that is within the confines of the law. I refused to go along with anything suggested that made poor medical care more easily available to the public because that essentially was dangerous practice.

The average cost of operating a hospital is one-third the original cost of the building. So that if you are planning on raising a sum of money for the hospital, be sure that that community each year, from one source or another, can find one third of that original cost to operate the hospital. If you have a quality hospital there, if it can be adequately supported, then it will attract the type of doctor you want to your community and to that hospital. I happen to be dean of the largest and the oldest graduate school of medicine in this country, and more and more I see these young men who are coming up as specialists. I think we are training too many specialists, but today you do need certain specialists represented in the hospital of your community if it is going to do the job the public has a right to expect.

The question of the general practitioner having the hospital open to him and in having greater opportunity in a rural community I have no quarrel with if the board will see that he limits the type of work he does to the field in which he is competent to work. He may be ever so capable an obstetrician and yet, if it came to removing a cataract, he might well be a plumber.

Voluntary Medical Prepayment Plans as They Apply to Rural Communities

Mr. Edward Mertz, Administrative Assistant, Department of Education, Farmers Educational and Cooperative Union of America, Denver: The base of the problem is economic and means a lack of rural income and medical purchasing power. In 1943, with farm prosperity at its highest in years, income of persons on farms was only 9 per cent of national income, while farmers made up 20.5 per cent of the national population. The last Census of Agriculture showed about two thirds of our farm families had gross income under $1,000 a year and one third of these had under $400 a year. In 1940 states with 70 per cent or more rural population had per capita incomes of only $300. Even if there were plenty of doctors, nurses, hospitals and health facilities, many farmers still could not afford to use them.

Many rural families cannot participate in voluntary prepayment plans because they have insufficient income—lack of health purchasing power, if you please. Many others will not because they don't have to! Unfortunately in many cases this group includes those who most need help both from an individual and from a community point of view.

Whether the reasons for lack of participation be economic, geographic or psychologic, the fact remains that fewer than 5 per cent of our whole population now receive general medical services on a prepayment basis. Less than 3 per cent of all farm people are covered for even Blue Cross hospitalization. There is much greater coverage in states with predominantly urban population.

Is there any question that a comprehensive health service plan which would provide physician and specialist care, hospitalization, dental services and prescribed drugs cost a farm family at least $100 per year? The next question is "How many farm families could or would invest $100 in medical insurance on a voluntary basis?" Before answering this question optimistically one should remember that in 1941 half of all farm operators had annual net cash incomes of less than $760 per family, including incomes from all nonagricultural sources. These plans do not and will not provide adequate and complete health for rural people.

This should in no way be construed to mean that the Farmers Union is opposed to the development of voluntary prepayment plans of hospitalization and medical services. On the contrary, we are currently engaged in the promotion and building of the Farmers Union Triangle Health Insurance Plan, which is essentially such a plan. At present this low cost plan provides primarily for hospitalization for specified periods. And many farm families use it. We hope soon to extend the hospitalization periods and include medical services, which will of course increase the cost. While many farmers will continue to use it, many will be unable to continue their prepayments because of the cost.

The National Farmers Union builds cooperatives. Some are built to increase the economic income of farm families. We hope this type of enterprise will help make possible a decent standard of living for every farmer, which will raise the levels of health facilities to help answer the health needs of our people. We hope that eventually increased income and cooperative organization will provide adequate health services for farm people.

We recognize that voluntary prepayment plans will not solve the problem. The record of experience clearly indicates how far we have come and probably how far we can go if we continue to disregard economic inability to pay and psychologic refusal to participate. We are not afraid of the word "compulsion" because we do not confuse freedom and responsibility.

We have long since learned that individual freedom is subordinate to the freedom and welfare of all and that public health is the total of individual health. Who now questions the "rightness" of quarantine or compulsory health education? We don't permit part of our citizens to contaminate water and milk supplies deliberately. We have rigid, compulsory laws against major crime. Do you think the Social Security Program is here to stay?

We know that voluntary plans have not and cannot do the total job for many years to come. We know the limitations of these plans. We know the health problem of farm people. We also know their ability, or rather their inability, to buy health at prevailing prices. We know our health problem will become increasingly worse unless we do more.

Therefore the National Farmers Union will continue to build our Triangle Health Service Plan and to cooperate with others in developing this type of program. We will continue to improve our economic ability to buy health services through our cooperatives. And we will continue to build cooperative hospitals and health services.

But we will also continue to use our resources to bring about a universal, compulsory, complete, public health insurance program at a cost which will permit all Americans to live in health. Farm people want more than hospitalization and medical insurance. They want everything it takes to maintain good health.

Mr. J. S. Jones, Secretary, Minnesota Farm Bureau Federation, St. Paul: To me it is one of the most healthful indications that I have seen that a group of professional people, medical men, and a group of leaders representing rural organizations will take the time from their busy days to come to a conference like this to discuss this important problem in its various phases.

The first real impetus given to the plan was the success obtained by Blue Cross hospitalization service plans. One of the resistances offered rurally to Blue Cross was "Why not medical care?" With this as a backgroud, state medical associations and laymen took notice and began to develop similar plans relative to prepaid medical care.

The lack of health facilities and health plans among the low income groups led to the development of a philosophy of governmental care among segments of our population. However, the opponents and proponents of that philosophy in the discussions that I have listened to are now living in the past, owing to changed economic conditions. In 1929 the average per capita income for the nation was $686. "Not much there for any kind of medical care." In 1945 the average per capita income was $1,150. Our big problem is trying to maintain that kind of an income. This improvement in the economic picture should be a source of gratification. With the improved economic situation and the increase in the per capita income, rural people in particular have turned to those factors which make for better living. That's why we have this tremendous interest now in better rural schools and better rural institutions.

Group prepayment plans for hospital service and medical care have been organized, stimulated and developed to a great degree by farm organizations. Farm organizations in a large manner have set the pattern for rural people. While these plans are not complete or perfect, they have shown the way to attack the problem of securing against illness and accident. In rural health we have arrived at a place where we have need of coordination of these plans.

The additional value of farm organizations is of great significance. We, the people, are a part of such enterprise; and the people know they are superior to the government purveyed, subsidized attack on the problem. I like to think, in regard to the Blue Cross movement, that we truly have done as much rurally for Blue Cross as Blue Cross has done for farm people in rural communities. When improved relationships develop and are in existence among present health facilities, hospitals, physicians and lay organizations, all existing health facilities can be fully utilized and, by working together, recognize the need, the time and the place for additional facilities which may be better observed as well as more economically offered and administered. In the organization that I happen to represent we were forced to go into a hospitalization plan a few years ago. We went the Blue Cross way. To my mind, one of the greatest benefits that comes to a member is as soon as membership in that plan is established he has somebody close to home that he can go to with his gripes. I think sometimes they get their money's worth by relieving themselves of their gripes.

While the early prepaid plans were successful, including practically all medical service plans, experience has indicated that rural people generally were not ready to pay the premiums for such protection contracts, with the result that development of prepaid rural health care plans progressed slowly. We have felt it preferable to begin operation with restricted contract and expand the services offered as we develop and proceed.

Voluntary prepaid plans may be largely set out in two groups, one known as the insurance group through the insurance way handled by insurance companies. It has its advantages and disadvantages, as I see it. One of the advantages, however, as seen from that standpoint, is this: That the more people that are out talking about it and selling it, so to say, the sooner we are coming to an appreciation on the part of all rural people of the value of that kind of program. In the insurance business, in life insurance and other types of insurance, we have a multitude of companies writing that business. Some companies dislike competition. They don't like to be in competition with one another, but to my mind the thing that has sold life insurance to America is the fact that there were a large number of companies and a large number of agents out talking and selling the insurance plan and we should not object to the competition.

On the other hand is the association plan. In the association plan we have some advantages in the low cost of acquisition, especially as applied to rural people where it's done voluntarily. I think the success of Blue Cross among rural people is attributable very largely to the fact that they go out and do it themselves.

The development of the Blue Cross has given interest to the matter of this prepaid medical care plan. Those who are participating in prepaid hospital plans now know that they are capable of taking care of the problem themselves by putting their health bill on an annual budget basis and prorating the cost on an actuary basis, and with the increase in the per capita that was mentioned earlier this morning, capable in a large way of taking care of their own health needs in a better manner than heretofore.

DR. JAMES R. MCVAY, Vice Chairman, Council on Medical Service, American Medical Association, Kansas City, Mo.: A review of voluntary medical prepayment plans reveals that in their modern concept they are strictly American. The oldest of American plans is the Northern Pacific Railroad Benefit Association, which was organized in 1882 and has operated continuously since that date. Prepayment plans have developed through industrial establishments, universities, consumer and cooperative groups, various governmental units, Blue Cross and medical societies or groups of physicians. In addition, insurance companies have offered various types of health and accident coverage to the public. The medical profession has contributed to the successful operation of all these plans.

Efforts are being made to obtain accurate figures on the number of people covered by these various voluntary prepayment plans. At present any figures must be considered as estimates, as no way has yet been devised to eliminate duplications when people have subscribed to two or more of these plans.

I am indebted to Mr. L. S. Kleinschmidt, Division of Prepayment Plans, Council on Medical Service, for the factual data given in this paper. The closest estimates obtainable today indicate that the total number of persons covered by the various types of voluntary prepayment plans are as follows:

Number of Persons Covered by Voluntary Prepayment Plans

Type of Plan	Total Coverage	Year of Information
Industrial	1,516,000	1945
University student	100,000	1943
Consumer and cooperative	504,000	1943-45
Governmental	580,000	1945-46
Blue Cross	25,000,000	1946
Medical society and physicians groups	5,000,000	
	32,700,000	
Insurance companies, hospitals, surgical, accident and health coverage	44,000,000	
Total	76,700,000	

Progress was slow in the beginning. Expansion of plans as we know them today has occurred largely during the past ten years and the major increase in enrolment in the past three years.

The prepayment plans for medical care received their first impetus as a result of the phenomenal success of the Blue Cross Hospital Service Plans. With both the hospital and the patients in need of some sort of program to ease the burden of hospitalization costs, these plans grew rapidly. Today the term "Blue Cross" is recognized by almost every one in the United States.

Using the earlier experience of prepayment hospital plans as a guide, a number of state medical societies undertook to develop medical care plans. The first statewide plan was the California Physicians' Service, organized in February 1939. Within a year Michigan Medical Service was organized. These two plans, together with the county medical society bureaus of the states of Washington and Oregon, gave the medical profession the necessary experience on which to build what has now become a nationwide movement.

The growth of medical care prepayment plans since 1939 has almost paralleled that of the hospital service plans. It took Blue Cross between five and six years to place thirty-eight plans in operation. This compares favorably with the six years it took to develop thirty-seven medical care plans. The same comparison can be made with reference to enrolment. In their first seven years medical care plans enrolled 2,845,000, while Blue Cross enrolled 2,870,000.

The development of prepayment medical care was in many ways more difficult and complicated than that of hospitalization. Hospital care is a more unified service with relatively few procedures involved, whereas medical care included an almost unlimited variety of services. The problems involved in the payment and handling of claims for medical procedures are far more difficult than those for hospitalization. Years of experimenting with various methods has resulted in definite progress toward essentially sound advancement. Hospital care plans deal with a relatively few institutions, whereas medical care plans deal with several hundred or even thousands of doctors. A medical care plan then to be practical must not rely on a relatively uniform institutional point of view but actually on a host of individual attitudes if we are to retain a high quality of medical care.

The growth of voluntary health care insurance plans since 1939 has been most remarkable. Counting the twenty-eight local plans in Washington and Oregon as two statewide plans, there are now fifty-eight medical care plans sponsored by medical societies or Blue Cross. Plans are now in operation in thirty-three states and are in the process of formation in thirteen more states and the District of Columbia. This leaves but two states, Mississippi and South Carolina, without some development reported to us. The fact that not one of the medical society prepayment plans has failed since 1939 and that the rate of growth has been rapid and steadily increasing attest to the application of common sense and to the desire of the medical profession to have prepayment medical care of a high quality available to all the people.

Methods of Expansion

With the experimental phases of medical care plans well under way, more attention can now be devoted to expansion of enrolment and expansion of benefits with special attention to reaching rural subscribers. The Council on Medical Service has established a Division of Voluntary Prepayment Medical Care Plans which acts as a clearing house of factual information, experiences and successful practices of all operating plans and, by the constant interchange of this information, enables the rapid correction of unsatisfactory practices.

The early plans in Washington and Oregon included practically all medical services, surgery, home and office care and even limitied nursing and dental care. Throughout the years this broad coverage has been continued. The plans organized in 1939 and 1940 followed this lead and also provided for reasonably complete medical care. In contrast to the experience in the Northwestern states, the experience of the latterly formed plans with full coverage was unsatisfactory. It was found that the public would not pay the premiums necessary to carry out such a broad contract. Whenever a surgical contract plus a general medical care contract was offered to the public, the ratio of enrolment was more than 100 to 1 in favor of the surgical program. As a result the plans have generally preferred to begin operations with fairly restricted coverage such as surgical care, obstetric, x-ray and anesthesia in hospitalized cases. Now most of the services necessary in cases so severe as to require hospitalization are covered.

The tendency to limit services to those performed in the hospital is a natural one. In the first place most of the costly illnesses are those that require hospitalization. Secondly, there is going to be little abuse of such services. Thirdly, the actuarial experience in hospitalized cases is sufficient to provide plans with a more certain basis for determining adequate premiums. A recent study of fifty-one medical service plans shows that thirty-four of the plans offer surgical services, obstetric and specified medical services in the hospital. This same study shows that plans are continuing to expand benefits. Twelve of the plans provide for general medical care, such as home and office calls, and five plans provide almost complete coverage. The average premium for a single subscriber is approximately $1.25 and ranges from as little as 60 cents to $4.85 a month. Family coverage ranges from $1.35 to $10 a month, with an average of about $3.

Plans are still experimenting with benefits and premium rates. As one plan succeeds in some new idea, the basis for this success is made available to other plans. The same, of course, is true of failures. In this manner vertical expansion will continue to grow as actual experiences and public demand indicate.

Reviews of experience in rural areas have indicated that with the facilities available the rate of use under prepayment is higher than in the cities. The accumulation of physical defects and of chronic illness is greater. The risk of accidents is greater. Farmers are not usually covered by workmen's compensation insurance. All injuries and illnesses automatically come within the scope of the prepayment plan.

The success of a plan offering general medical coverage depends on meeting the people's need for medical care with proper control of abuses and on the maintenance of the costs at a point consistent with adequate standards of service and at premiums salable to rural subscribers. It is the job of the medical profession to keep its members informed. So too it is the job of the enrolling groups, whether they are factory, farm or community, to prevent the abuse of the benefits of the plans by their members. Equal interest in determining both coverage and premiums on a local basis should facilitate answers as to what additional medical serivces are needed, what the subscribers will pay and what the plan charge must be to remain financially sound.

Horizontally, the expansion of the prepayment medical care program is limited only by the ability and willingness of the public to enroll as subscribers. It is true that most of the plans have tended to concentrate on urban areas where large group enrolments were possible. This was a sound method because the sooner the plan obtains an adequate risk spread the sooner it can expand its benefits and enrolment program. Large group enrolment provides this spread more easily and with less acquisition cost. However, the pattern is now changing and, having reached a reasonable enrolment and a sound financial level, ways and means of reaching all population groups—particularly the rural—are being explored. In general, the pattern has not been to deal with the farm group as a separate problem but to include it in what is called community enrolment. In community enrolment the farmer is considered a part in the area encircling a town or village. Usually the town is the center for trading. The whole community then becomes a group with premium payments payable at some central place.

A Method for Proceeding

A successful Blue Cross enrolment campaign in rural areas was carried out in Colorado by the Weld County Agricultural Health Association. Enrolment was on a community basis, reaching all elements of the community as a civic service. Weld County, the largest county in Colorado, is about three times the size of Rhode Island and has a population of 63,700. Greeley is the largest town in the county, with 15,900 population, and there are several smaller towns. Prominent businessmen, farm organization leaders and various club leaders met with the Blue Cross representatives and decided to form a health association under the Colorado law governing cooperatives. Twelve directors, each representing a definite district in Weld County, govern the health association. This division provided workable units in size and population for an enrolment and administrative program. Enrolment was not limited to Blue Cross, but each district was allowed to enroll separately in the Colorado Medical Service plan whenever 50 per cent or more of the families in the district had subscribed to the Health Association. To date Weld County has 8,000 participants enrolled. Colorado has organized ten other similar county health associations and thus far has enrolled one in every six persons in rural areas and one out of every two urban residents.

Iowa has organized fifty-five similar county health improvement associations. Other states are enrolling on a similar community basis with less formal organization.

Voluntary prepayment plans are growing rapidly in rural areas. A survey of Blue Cross rural enrolment reported in November 1946 by the Blue Cross Commission shows an increase of 200 per cent since 1944. The study shows a total of 1,637,533 subscribers and dependents now as compared with 500,000 rural members in 1944.

Many medical care plans have developed their organizations to the point where rural enrolment is being carried on or plans are being made by those reaching into rural areas. A study of these plans now under way indicates that about one half of those doing rural enrolment, twelve plans, have reported 304,542 subscribers and dependents. It is estimated that the study, when completed, will show medical care plans in a position comparable with Blue Cross of two years ago—or a half million rural members.

The problem cannot be solved at a national level. It must, to be successful, be worked out in the community where the need exists. There must be developed a community responsibility which will lend its active support if any effort is to succeed.

Continuing improvements in transportation and extension of better roads will accelerate the growing tendency of rural people to bring the patient to the physician. Thus the physician's care and the use of other health facilities can be extended over an area that includes a sufficient number of people to meet the costs of the services provided.

Use of the Insurance Principle

A study of the fees for medical services rendered by the rural practitioners shows that they are not excessive. However, there are times when illnesses strike and the severity of the cases cannot be predetermined. For this reason many farm families faced with severe illness find it difficult to meet the full costs from their income. This problem of meeting the costs is basically the same as it is with people living in towns. The only sound method so far devised is through the use of the insurance principle we have described. Prepayment medical care plans available to all people of a community, townspeople and farmers alike, tend to spread the risk and distribute the costs. Thus, having the cost known in advance, proper planning and budgeting for these otherwise unpredictable costs is possible.

Families or individuals unable to pay the full costs of medical care from their incomes and those now receiving public assistance should be called on to pay for their own medical care as far as is consistent with their incomes and provision made through locally administered public funds to pay the balance of the premium required to participate in a prepayment plan. Every effort should be made to help and not to pauperize or regiment the most individualistic element of our social economy—the American farmer.

The problem of the lower income groups can be solved by local communities and state actions in line with the rapidly developing voluntary prepayment medical care movement.

Division of Responsibility

Who carries the responsibility for the medical care program? The physicians because of their special training cannot escape the responsibility for the professional aspects of the program. Experience has shown that they do not want to. The recipients of the medical service (the people) cannot escape the responsibility of paying the costs of the services. Both should do their full share in providing the needed facilities. With full cooperation of the medical profession and the people, working in mutual confidence, a medical care program can succeed by undertaking the various types of medical service one step at a time. As experience is gained, additional types of medical care can be included. Coverage may be as complete as is desirable in any community. Progress can be as rapid as experience indicates and the economic situation permits.

For ten years or more doctors have operated experimental plans in medical care insurance. On the basis of this experience they now feel ready to recommend prepayment plans to the people. The Council on Medical Service created by the House of Delegates of the American Medical Association has as one of its primary functions the fostering and developing of prepayment plans. The American Medical Association has rural health committees devoting their attention to the rural problem as do the various state medical associations.

It Can Be Done

Local representatives of farm organizations such as those present here today, together with business groups and local medical societies working in full cooperation and mutual confidence and understanding, are now in a position as never before to work out this heretofore difficult phase of delivering medical care to all the people. And unfettered by the totalitarian ideologies of the Old World we will continue to be "America, the land of individual opportunity."

(To be continued)

Medical Legislation

MEDICAL BILLS IN CONGRESS

Department of Health, Education and Security

A bill introduced by Senator Aiken, Vermont, S. 712, proposes to constitute the Federal Security Agency a **Department of Health, Education, and Security.** The Department will be administered by a Secretary appointed by the President by and with the advice and consent of the Senate and there will be an Under Secretary and two Assistant Secretaries, also appointed by the President by and with the advice and consent of the Senate. The bill does not prescribe the qualifications to be possessed by either the Secretary, the Under Secretary or the two Assistant Secretaries.

Diseases of the Heart and Arteries

Senator Pepper, Florida, has introduced S. 720, requesting the President to mobilize at some convenient place in the United States an adequate number of the world's outstanding experts and coordinate and utilize their services "through the Surgeon General of the United States" or through an independent group appointed by him and build clinical and laboratory research facilities, in a supreme endeavor to discover means of preventing, treating and curing **diseases of the heart and arteries.** According to the bill, such diseases now kill 587,314 people a year in the United States, and cause disability to 7,840,000 more. An appropriation of $100,000,000 would be authorized to enable the President to carry out the purposes of the legislation.

Health of School Children

Senator Morse, Oregon, by S. J. Res. 66, would authorize the Secretary of Labor, acting through the Children's Bureau "of the Department of Labor," in cooperation with Federal, State and local agencies and qualified institutions of higher education to (1) make studies of the **health and physical status of children of school ages;** (2) make studies of the facilities and services offered by schools for the correction of physical defects of children of school ages; and (3) recommend the use of, and demonstrate in representative urban and rural areas, methods of conducting school health examinations and providing school health services. For the purpose of defraying the expenses of the Department of Labor in carrying out the provisions of the joint resolution and providing funds for direct grants by the Secretary of Labor to State departments of health, State departments of Education, and qualified institutions of higher learning, there will be authorized to be appropriated $100,000 for the fiscal year ending June 30, 1947 and $450,000 for each of the succeeding fiscal years.

Miscellaneous

H. R. 2045 has passed the House and Senate, amending the Federal Food, Drug and Cosmetic Act by providing for the certification of batches of drugs composed wholly or partly of any kind of **streptomycin or any derivative thereof.**

By H. R. 1811, introduced by Representative Boggs, Louisiana, it is proposed that dispensary treatment and hospitalization in Army and Navy hospitals be provided for **retired enlisted men** of the Army, Navy, Marine Corps, and Coast Guard.

S. 459 has passed the Senate in an amended form, providing that no person shall be discriminated against under **the Civil Service Act** because of any physical handicap provided his or her employment will not endanger the health or safety of fellow employees.

The establishment of a **veterans' hospital** in southeastern Alaska is proposed by H. R. 1880, introduced by Representative Hagen, Minnesota.

STATE LEGISLATION

Arizona

Bills Introduced.—S. 119 proposes the enactment of a **hospital survey and construction act** requiring a statewide survey of hospital facilities and the preparation of a program for the construction of additional needed facilities. The superintendent of public health is authorized to apply for federal aid in survey and planning activities, and the state department of health is appointed as the state agency to conduct the survey and develop the state plan. S. 120 proposes the enactment of a **hospital licensing law** and the establishment of a hospital advisory council.

Arkansas

Bills Introduced.—H. 92 and S. 301 propose that all persons applying for a **marriage license** shall present a certificate signed by a licensed physician stating that such applicant is free from venereal disease. S. 308, *to amend the medical practice act*, proposes to **eliminate the homeopathic board of examiners.**

Bills Enacted.—H. 18 has become Act No. 71 of *the Acts of 1947.* It requires every physician, at the time of the first examination, to take or cause to be taken a sample of the blood of a **pregnant woman** and to submit the same to an approved laboratory for a standard serologic test for syphilis. H. 109 has become Act. No. 85 of *the Acts of 1947;*

It is a hospital survey and construction act providing for a **survey of hospital facilities** in the state and the preparation of a program for the construction of additional needed facilities The law requires the appointment of an advisory hospital council and authorizes the state board of health to apply for and accept federal funds for assistance in state survey or construction plans

California

Bills Introduced—A 2243, to amend the law relating to nonprofit **corporations operating hospitals**, proposes that such corporations claiming tax exemption or other benefit on the ground that it is nonprofit shall admit to any hospital operated by or under the control of the corporation any person in need of its facilities whose admission is requested by any person holding a valid and unrevoked physician's and surgeon's certificate issued under the provisions of the business and professions code A. 2279, to amend the business and professions code relating to applications of **commissioned medical officers**, proposes that such applicants shall be granted a license to practice on filing an application on a form prepared by the board A 2307 proposes certain regulations prohibiting **the vivisection of animals** and withdrawing the exemption from such provisions of properly conducted scientific experiments or investigations performed under the authority of the faculty of a regularly incorporated medical college or university of the state. S 1278 proposes to authorize the board of medical examiners to examine and license persons desiring to practice **physical therapy** and defines a physical therapy technician or physiotherapy technician as a person who undertakes or represents himself as able to treat or to alleviate ailment, deformity, fatigue, human disease, injury, obesity, pain or any other physical or mental condition by the use of massage, therapeutic massage, exercise, therapeutic exercise or by the use of the physical, chemical and other properties of electricity (except x-rays, radium and electrosurgery), heat, light or water S 1469 proposes general regulations for the licensing and regulating of health insurance and service plans

Colorado

Bill Introduced.—H 895 proposes to appoint the Colorado State Department of Public Health as the sole agency for carrying out the purpose of **the federal hospital construction** act and to require the governor to appoint a state advisory hospital council

Connecticut

Bill Introduced.—S 742 proposes to authorize **injured employees** at all times to select a physician or hospital of their own choice.

Georgia

Bills Introduced — S 48 proposes to require both **applicants for a marriage license** to present a certificate signed by a regular physician licensed to practice medicine in the state of Georgia certifying that no clinical evidence of syphilis has been found and that the applicant is not infected with such disease in a stage in which it may become communicable to the marital partner H 249 proposes that the curriculum of all high schools in the state supported wholly or in part by public funds shall contain a course **in sex hygiene** to be taught in the last two high school grades

Idaho

Bills Passed—H 141 passed the senate February 26 It proposes to add **cancer** to the list of diseases which a physician must immediately report to the department of public health. H 144 passed the senate February 27. It proposes to limit the sale of **barbituric acid** or compounds to sale on prescriptions signed by a person licensed to prescribe or administer barbiturates The prescription would not be refillable unless specifically designated on the prescription S. 55 passed the senate February 27 It proposes a **hospital licensing law.** This proposal was amended in the senate on February 24 by proposing to exempt from such licensing requirements any supervision, regulation or control of the remedial care or treatment of residents or patients in any home or institution conducted for those who rely on treatment by prayer or spiritual means in accordance with the creed or tenets of any well recognized church or religious denomination, except as to sanitary and safe conditions of the premises, cleanliness of operation and its physical equipment S. 102 passed the senate February 27. It proposes the enactment of a state **hospital survey and construction** act requiring a statewide survey of hospital facilities and the preparation of a program for the construction of additional facilities The proposal would also require the appointment of an advisory hospital council and would authorize the commissioner of the state department of public health to apply for and accept federal funds to assist the state in survey and construction activities

Indiana

Bills Passed.—H 450 passed the house February 27. It proposes to provide for the licensing, inspection and regulation of **nursing homes.** S. 1 passed the house February 25. To amend the law relating to **hospital surveys,** it proposes to appoint the state board of health as the state agency to cooperate with the federal government in the construction of hospitals within the state and proposes to add to the hospital survey law a new section defining the terms "hospital," "public health center" and "nonprofit hospital"

Iowa

Bills Introduced.—H. 357 proposes the creation of a state **board of naturopathic examiners** and proposes "'Naturopathy,' which includes all forms of physiotherapy, is that system of the healing arts which means 'Nature cure or health by natural methods' and is defined as 'the prevention, diagnosis and treatment of human injuries, ailments and diseases by means of any one or more of the psychological, physical or mechanical, chemical or material, forces or agencies of nature'." S 397 proposes a law for the licensing, inspection and regulation of hospitals

Kansas

Bill Introduced—H. 308, to amend the law relating to the **licensing of osteopaths,** proposes that they shall have received at least two terms of nine months each of preprofessional training and proposes to extend the scope of osteopathic practice to include the right to use and prescribe narcotics

Maine

Bills Introduced—S 293 proposes to authorize local health officers to annually provide for the **free vaccination** of all inhabitants within his jurisdiction and to provide for free inoculation against diphtheria and whooping cough of all children under 12 years of age S. 335 proposes an enabling act for the formation of **medical service plan corporations**

Maryland

Bills Introduced.—H. J. R 8 proposes the appointment of a committee to study the need for hospital facilities exclusively for the treatment of **rheumatic fever** and to make recommendations therefor. S. 209 proposes the granting of **free scholarships** to the University of Maryland school of medicine.

Massachusetts

Bill Introduced.—H. 1361 proposes regulations governing the right **to engage in animal experimentation.** The proposal makes no exception in favor of hospitals or medical schools but they too must obtain the necessary certificate from the commissioner of public safety.

Minnesota

Bills Introduced.—H. 878 proposes a law relating to the incorporation of voluntary nonprofit **medical care corporations.** H 882 proposes to prohibit **hospital employees** of a charitable hospital from encouraging, participating in or causing any strike or work stoppage against or directly involving such charitable hospital.

Missouri

Bill Introduced.—H. 132 proposes a new law relating to the licensing, regulation and supervision of **maternity hospitals.**

Montana

Bills Passed.—H. 235 passed the house February 21. It proposes a law for the licensing and regulating of **hospitals within the state.** A house amendment of February 14 added to the proposal the requirement that no person operating a hospital shall in any manner or by any device discriminate between the patients of any regularly licensed physician for or on any ground or reason whatever, including the fact that such physician is not a member of the medical or surgical or other staff, clinic or internal instrumentality of the hospital. An amendment of February 18 in the house exempted Christian science institutions from the operation of the proposal. H 236 passed the house February 21. It proposes the enactment of a Montana **Hospital Survey and Construction Act** requiring a survey of hospital and health facilities in the state, a program of construction for additional needed facilities, the appointment of an advisory hospital council and the necessary cooperation for the receiving of federal funds to aid in the construction of such additional needed facilities as the program may require.

New Hampshire

Bill Introduced.—H 370 proposes the enactment of a **hospital survey and construction** act requiring a survey of hospital facilities within the state and the preparation of a program for the construction of additional needed facilities The proposal also requires the appointment of an advisory hospital council and authorizes the state board of health to apply for and accept federal funds for assisting the state in its hospital program

Bill Passed.—S. 19, to amend the law relating to **medical service corporations,** passed the senate February 26 It proposes to authorize the members of the board of trustees or directors of the medical service corporations in the state to be members of the Vermont Medical Society and residents of Vermont.

New Jersey

Bill Introduced—S 66 proposes to appoint the state department of institutions and agencies as the agency **to receive federal funds** to assist in a state survey of hospitals and the development of a state program for the construction of additional needed facilities.

New Mexico

Bill Passed.—S. 80, to amend the law relating to **osteopathic physicians,** passed the senate February 24 It was previously reported as proposing to eliminate therefrom the requirement that no plan for rendering medical services shall be adopted by any state, district, county, city or town which discriminates against osteopathic physicians and surgeons This proposal was amended in the senate on February 24 by proposing the insertion of the words "and no plan, program or other matter shall be approved by any state, district, county, city or town official which discriminates against osteopathic physicians and surgeons; provided, however, that this section shall not be construed to affect any plan, program or other matter concerning the operation or maintenance of any hospital or other institution or fraternal group or organization, provided, however, if the presence of any osteopathic physician on the staff of any tax supported hospital will under federal law or regulation prevent such hospital from receiving any federal funds, the governing authority of such hospital will have the power to remove all osteopathic physicians from the staff of such hospital."

North Dakota

Bills Passed.—H. 52 passed the house February 19. It proposes to amend the law relating to hospitals by setting up rules and regulations for the **licensing of maternity homes** and maternity hospitals. H. 127 passed the house February 13 and the senate February 28. It proposes regulations for the licensing of **chiropractic hospitals** by the state board of chiropractic examiners. S. 38 passed the huose February 26. It proposes to require every physician or other person authorized by law to practice obstetrics, who attends **a pregnant woman** for conditions relating to pregnancy, to take or cause to be taken a sample of blood of such woman at the time of the first professional visit and to submit such sample to an approved laboratory for a standard serological test for syphilis.

Ohio

Bills Introduced.—H. 136, to amend the medical practice act, proposes to exempt therefrom practitioners of the **Christian science church** who attempt to treat human ills through prayer alone. H. 280 proposes to limit the **sale of barbiturates** to sale by a pharmacist on prescription of a licensed practitioner or sale by the practitioner in the course of his own practice. S. 165 proposes the creation of a **board of chiropractic examiners** and defines chiropractic as "the art and science of locating, the procedure preparatory to adjusting, and the adjusting by hand of the subluxations of the articulations of the spinal column, which is deemed to be the twenty-four movable vertebrae, including the sacrum and coccyx and adjacent tissues, for the purpose of removing any interference with nerve transmission; but it shall not include surgery nor the administration or prescription of any drug included in materia medica, and it shall not be deemed to be a branch of the practice of medicine or surgery within the meaning of section 1286 of the General Code, or of section 12691 of the General Code; neither shall it be deemed to be the practice of osteopathy, obstetrics, optometry, dentistry, chiropody nor any limited branch of medicine or surgery, other than chiropractic, as designated in section 1274-1 of the General Code."

Oklahoma

Bill Introduced.—S. 122 proposes the enactment of a **mental health law.**

Bill Passed.—H. 159 passed the house February 24. It proposes to require various practitioners of the healing art to **list descriptive letters after his name** in order to designate the branch of practice in which he engages.

Oregon

Bill Introduced.—S. 356 proposes to prohibit any discrimination against a person because he has purchased **prepaid medical insurance** or similar services.

Pennsylvania

Bills Introduced.—H. 153 proposes to provide for the examination and **licensure of masseurs** and defines the occupation of masseur as "the massaging of the human body through the use of manual therapy." S. 108 proposes an appropriation to the trustees of the Pennsylvania state College for the establishment of a **state medical college.**

South Carolina

Bill Introduced.—H. 24, **to amend the marriage law,** proposes to require each applicant for a marriage license to present a certificate signed by a duly licensed physician of his state certifying that such person is of sound mind and is free from venereal disease.

South Dakota

Bills Passed.—H. 50 passed the house February 24. It proposes the enactment of a South Dakota **hospital survey and construction act.** A house amendment of February 21 would require any institution accepting federal funds for construction purposes to first agree that it will not discriminate between practitioners of the various healing arts and every duly licensed doctor of medicine, osteopathic physician and chiropractor shall have the right to and shall be entitled to practice his profession in any such hospital which has received federal funds. H. 302 passed the senate February 28. To amend the **basic science act,** it proposes to exempt therefrom any one who has served as a medical officer in World War II. S. 184 passed the senate February 27. It proposes to prohibit the **sale of barbiturates** except on the original prescription of a practitioner, which the proposal defines as a person licensed by law to prescribe and administer barbiturates.

Tennessee

Bills Enacted.—H. 232 was approved February 7. It provides for the regulation and **licensing of all hospitals** within the state. S. 153 has become chapter 16 of the Public Acts of 1947. It is a **hospital survey and construction act** providing for a statewide survey of hospital facilities and the preparation of a program for the construction of additional needed facilities. The commissioner of the state department of health is authorized to receive federal funds in behalf of applicants desiring to construct additional facilities and to transmit them to such applicants after their plans have been approved.

Vermont

Bill Introduced.—H. 164 proposes an appropriation for the continued maintenance of the Vermont **blood plasma bank.**

Washington

Bills Introduced.—H. 285, to amend the law relating to **county and other government hospitals,** proposes to authorize such hospitals to be members of and maintain membership in any local, state or national group or association organized and operated for the promotion of the public health and welfare or the advancement of the efficiency of hospital administration and in connection therewith to use tax funds for the payment of dues and fees. H. 297 proposes a survey for the discovery, treatment, hospitalization, education and training of persons afflicted with **cerebral palsy** and the appointment of a committee to make such a survey. H. 378 proposes to require **applicants for a license to practice** medicine and surgery to have graduated from a medical school accredited and approved by the Association of American Medical Colleges and the Council on Medical Education and Hospitals of the American Medical Association. H. 454 proposes **to authorize optometrists** to render expert testimony in court relative to the diagnosis of the human eye or any refractive muscular or anatomic condition thereof.

Bills Passed.—S. 158 passed the senate February 21. It proposes the creation of a **medical disciplinary board** to hear complaints for the revocation of professional licenses. S. 216 passed the senate February 26. It proposes the enactment of a **hospital licensing law.**

West Virginia

Bills Enacted.—H. 9 was approved February 25. It amends the medical practice act by exempting therefrom the practice of the **religious tenets of any church** in the ministration to the sick or suffering by mental or spiritual means, provided sanitary and public health laws are complied with and provided no practices shall be used which may be dangerous or detrimental to life or health and further that no person shall be denied the benefits of accepted medical and surgical practices H. 13 was approved February 25. To amend the **law relating to autopsies,** it provides that a coroner or justice shall not, without the consent of the prosecuting attorney, authorize an autopsy or chemical analysis on a dead body unless the justice or coroner has first obtained the consent in writing of the next of kin, and the cost shall be paid by the county court on the order of the prosecuting attorney. This provision would not be applicable, however, where the prosecuting attorney reasonably believes that an unlawful act has been committed.

Washington Letter

(From a Special Correspondent)

March 13, 1947.

Hawley Warns Medical Work Periled by Lack of Funds

Until Congress grants a deficiency appropriation, the Veterans Administration is without funds to carry on medical work, Dr. Paul R. Hawley, the agency's medical chief, told a panel discussion on veterans' hospitals conducted by the American Legion Conference on Veteran Rehabilitation. Dr. Hawley informed the 500 delegates that future activities depend on a deficiency grant to carry the administration through next June. He explained rapid demobilization of the armed forces was responsible for the medical division's funds running out. Representative Taber of New York, appropriations committee chairman, recently led the fight to have the $600,000,000 deficiency appropriations request for administration purposes cut to $180,000,000 pending further study. Colonel F. H. Dryden, Veterans Administration assistant administrator for construction, defended the agency against charges of unnecessary delay in hospital building. He said the program is going ahead as rapidly as costs and facilities will allow.

Allocation of Streptomycin to Veterans Administration Increased

The March allocations of streptomycin to the Veterans Administration was increased to 28,500 Gm. from the October 7,500. The Civilian Production Administration reports the total initial U. S. allocation for the month was 410,625 Gm. as compared with the 325,225 Gm. initially released in February. The allocation is apportioned as follows: armed service, 30,000 Gm.; other government agencies, 30,000; chemical research, 18,945; tuberculosis research, American Trudeau clinical program, 9,000; for civilian use 322,700 Gm., of which 75,000 is for export.

World Health Constitution Expected to be Ratified

Surgeon General Thomas A. Parran of the U. S. Public Health Service told an audience in the Federal Security Auditorium here that "only a handful" of nations (not including the United States and the Soviet) had already ratified the constitution for a world health organization signed by 61 of the 63 nations at last summer's conference in New York. He added that ratification by all was anticipated. Dr. Parran declared that air travel had wiped out barriers of time and space once protecting America from diseases of far-off lands. "The only effective protection we have in this country against the spread of epidemics is to help stamp out diseases wherever they occur throughout the world," he said.

Russians Reported Training 1,980,000 Technicians in Five Years

Soviet publications released here disclose that Russia's five year plan for science includes the training of 1,280,000 technicians and 700 laboratory specialists having scholastic degrees. The Soviet is making a tremendous effort to recover from wartime losses of research equipment and personnel. Research in medicine as well as atomic energy and other subjects is being covered. Special inducements offered Russian scientists are extra rations, housing, cash and honorary awards. German scientific personnel is also being extensively used.

House Members Criticize Research Phase of Armed Forces Merger

Although Congress is expected to agree to the main provision of President Truman's armed forces merger plan, House members have criticized provisions for military research and procurement divisions. They contend that research should be open to civilian scientists as well as servicemen and there should be greater standardization of Army-Navy purchasing. Representative James W. Wadsworth, Republican of New York, said he would like to see the research and procurement phases "strengthened to the point where they are geared for the highest measure of performance."

200,000 Americans Are Potentially Unemployable Each Year Through Disablement

Mrs. Walter Bloedorn, chairman of the fund advisory committee, Washington Committee for Civilian Rehabilitation, stated modern medicine and rehabilitation agencies are neglecting 200,000 Americans each year who become potentially permanently unemployed through disablement.

Doctor Makes Mercy Flights Piloting His Own Plane

Dr. William W. Welsh, of Rockville, Md, makes mercy flights in his own small airplane. His latest act of mercy was to fly with a local pilot to a remote section of Montgomery County to drop sulfonamide drugs at a farmhouse where a child was ill with pneumonia

Funds Required for Study of Aphthous Fever in Mexico

An investigation of aphthous fever, the human counterpart of foot and mouth disease, will be conducted in Mexico if funds are available, say Public Health service officials They are anxious to make the study because of the serious cattle plague and lack of knowledge of the human side of it.

Senate Gives Red Cross Chapters Greater Voice in Affairs

The Senate has passed a bill, now before the House, which gives local chapters of the American Red Cross a greater voice in local affairs and amends the law incorporating the Red Cross to increase the board of governors from 18 to 50, of whom 30 would be elected by the chapters.

United States Blocks the Shipment of Drugs to Cuba

Narcotics commissioner Harry J. Anslinger banned shipments of narcotics to Cuba after it was learned that Charles Luciano, New York racketeer deported to Italy, had taken up residence in Havana The United States is the principal supplier of drugs to Cuba, solely for medicinal use. It was feared that Luciano might cause the diversion of the narcotics to illegal uses. The ban was lifted after Cuban authorities took Luciano into custody and arranged for his return to Italy.

Doctor Ties for Third Place in Bridge Championships

Dr. A. J. Steinberg of the District of Columbia tied for third place in the Worlds Masters Individual Bridge Championships, held in New York. He played against 65 other contract experts and lacks only six cumulative points of winning the Life Masters rating, highest rank conferred by the American Contract Bridge League.

Coming Medical Meetings

Alabama, Medical Association of the State of, Birmingham, April 14-16 Dr. Douglas L. Cannon, 519 Dexter Ave., Montgomery 4, Secretary.

American Association for the Study of Goiter, Atlanta, Ga., April 3-5 Dr. Thomas C. Davison, 478 Peachtree St., N. E., Atlanta 3, Secretary.

American Association of Anatomists, Montreal, Canada, April 3-5. Dr. Normand L. Hoerr, 2109 Adelbert Road, Cleveland 6, Secretary.

American Association of Industrial Physicians and Surgeons, Buffalo, N. Y., Statler Hotel, April 26-May 4. Dr. Frederick W. Slobe, 28 E. Jackson Blvd, Chicago 4, Secretary.

American College of Physicians, Chicago, April 28-May 2. Mr. E. R Loveland, 4200 Pine St., Philadelphia 4, Secretary.

American Laryngological Association, St. Louis, April 23-24. Dr. Arthur W. Proetz, 12 Westmoreland Place, St. Louis 8, Secretary.

American Laryngological, Rhinological and Otological Society, St. Louis, April 25-26. Dr. C. Stewart Nash, 288 Alexander St., Rochester 7, N. Y., Secretary.

American Otological Society, St. Louis, April 21-22. Dr. Gordon D Hoople, 713 E. Genesee St., Syracuse 2, N. Y., Secretary.

American Society for Clinical Investigation, Atlantic City, Chalfonte Haddon Hall, May 5. Dr. Eugene A. Stead Jr., Grady Hospital, Atlanta 3, Georgia, Secretary.

American Society for Research in Psychosomatic Problems, Atlantic City, May 3-4. Dr. Edwin G. Zabriskie, 714 Madison Ave., New York 21, Secretary.

Arizona State Medical Association, Tucson, May 7-10. Dr. Frank J Milloy, 112 N. Central Ave., Phoenix, Secretary.

Arkansas Medical Society, Little Rock, April 17-19. Dr. William R. Brooksher, 602 Garrison Ave, Fort Smith, Secretary.

Association of American Physicians, Atlantic City, May 6-7. Dr. Joseph T. Wearn, Lakeside Hospital, Cleveland 6, Secretary.

California Medical Association, Los Angeles, Hotel Biltmore, April 30-May 3 Dr. L. Henry Garland, 450 Sutter St., San Francisco 8, Secretary.

Connecticut State Medical Society, New Haven, April 28-30. Dr. Creighton Barker, 258 Church St, New Haven 10, Secretary.

Dallas Southern Clinical Society, Dallas, Texas, March 17-20. Dr. Glenn D. Carlson, 1133 Medical Arts Bldg., Dallas, Secretary.

Florida Medical Association, Miami, April 20-23. Dr. Robert B. McIver, P. O. Box 1018, Jacksonville, Secretary.

Georgia, Medical Association of, Augusta, Bon Air Hotel, April 22-25. Dr. Edgar D. Shanks, 478 Peachtree St. N. E., Atlanta, Secretary.

Hawaii Territorial Medical Association, Lihue, Kauai, May 1-4. Dr. Harry L Arnold Jr., 510 S. Beretania St., Honolulu 53, Secretary.

Iowa State Medical Society, Des Moines, April 16-18. Dr. John C. Parsons, 406 Sixth Ave., Des Moines 9, Secretary.

Maryland, Medical and Chirurgical Faculty of, Baltimore, April 22-23 Dr. W. Houston Toulson, 1211 Cathedral St., Baltimore 29, Secretary.

Mid Atlantic Section, American Urological Association, Washington, D. C., Hotel Statler, March 20-22. Dr. Theodore R. Fetter, 255 S. 17th St., Philadelphia, Secretary.

Mississippi State Medical Association, Biloxi, May 6-8. Dr. T. M. Dye, Box 295, Clarksdale, Secretary.

Missouri State Medical Association, Kansas City, March 30-April 2. Mr. Thomas R. O'Brien, 634 N. Grand Blvd., St. Louis 3, Executive Secretary.

Nebraska State Medical Association, Omaha, April 28-May 1. Dr. R. B. Adams, 416 Federal Securities Bldg., Lincoln 8, Secretary.

New Jersey, Medical Society of, Atlantic City, Haddon Hall, April 22-24. Dr. Alfred Stahl, 160 Lincoln Ave., Newark 4, Secretary.

New Mexico Medical Society, Albuquerque, April 30-May 3. Dr. H. L. January, 221 West Central Ave., Albuquerque, Secretary.

New York, Medical Society of the State of, Buffalo, May 5-9. Dr. Walter P. Anderton, 292 Madison Avenue, New York 19, Secretary.

North Carolina, Medical Society of the State of, Virginia Beach, Va, Cavalier Hotel, May 12-14. Dr. Roscoe D. McMillan, P. O. Box 232, Red Springs, Secretary.

Northern Tri-State Medical Association, Detroit, April 8. Dr. John L Stifel, 232 Michigan St., Toledo 2, Ohio, Secretary.

Ohio State Medical Association, Cleveland, May 6-8. Mr. Charles S Nelson, 79 E. State St., Columbus 15, Executive Secretary.

Oklahoma State Medical Association, Tulsa, Mayo Hotel, May 14-16 Mr. R. H. Graham, 210 Plaza Court Bldg., Oklahoma City, Executive Secretary.

Southwest Allergy Forum, Shreveport, La., March 31-April 1. Dr. Sim Hulsey, 505 Medical Arts Bldg., Fort Worth, Texas, Secretary.

Tennessee State Medical Association, Memphis, April 8-10. Dr. W. M. Hardy, 706 Church St., Nashville 3, Secretary.

Texas, State Medical Association of, Dallas, Adolphus Hotel, May 5-8 Dr. Holman Taylor, 1404 W. El Paso St., Fort Worth 3, Secretary

GOVERNMENT SERVICES

ARMY

HEARINGS ON MEDICAL SERVICE CORPS BILL

Hearings began in February on H. R. 1982, a bill proposing to establish a Medical Service Corps in the Army Medical Department, consisting of the Pharmacy Section, Optometry Section, Medical Allied Science Section and such other sections as the Secretary of War may deem necessary. The Surgeon General, Major Gen. Norman T. Kirk, pointed out in connection with the first hearing on the bill that preservation of health in conservation of the strength of the military forces entails the performance of numerous duties which do not require the application of professional technical training in medicine, dentistry or veterinary medicine. These duties, such as certain phases of medical supply, personnel management, laboratory investigation, psychiatric social work, clinical psychology and sanitary engineering, can be performed adequately by scientific specialists and skilled administrative personnel.

It is proposed to establish in the Medical Department of the Regular Army a Medical Service Corps with a Reserve component which will be composed of pharmacists, sanitary engineers, optometrists, psychologists, bacteriologists, business administrators and officers of similar skill, all of whom have served with the Medical Department. Experience during World War II demonstrated the advisability of including these scientific and highly trained specialists of the Medical Department in a single corps. General Kirk indicated that on the basis of needing a thousand officers in the Medical Service Corps, 60 per cent would be in the Pharmacy Corps, 38 per cent in the Allied Sciences Corps and 2 per cent in the Optometry Corps.

MICROFILM SERVICE AVAILABLE TO PHYSICIANS

The Army Medical Library, through its photoduplication services, supplied millions of pages of microfilmed medical articles to the armed services and other research agencies during the war. The principle of immediate aid direct to the user, wherever he might be, introduced a new technic to assist medical research. This service is now generally available for civilian physicians, institutions and research workers on a cost basis. This means direct access to the library's enormous resources of medical literature.

A fee of 50 cents is charged for filming any periodical article in a single volume, regardless of length. Microfilming from monographs is furnished at 50 cents for fifty pages or fraction thereof. Photostats are also available at a charge of 50 cents for each ten pages or fraction thereof. Material filmed is not for reproduction without permission of the copyright owner.

To keep costs down, a coupon system has been established. Users may buy any quantity of photoduplication coupons at 50 cents each. Order blanks are available on request. Checks should be made payable to the Treasurer of the United States and sent to the Army Medical Library, 7th Street and Independence Avenue S.W., Washington 25, D. C.

ARMY OCCUPIES ST. LUKE'S HOSPITAL IN TOKYO

The U. S. Army 49th General Hospital now occupies the widely known St. Luke's Hospital in Tokyo, serving the medical needs of the occupational personnel in Japan. St. Luke's Hospital was an American institution open to all races and creeds and was founded in 1884 under the auspices of the Episcopal Church. One of the first hospitals to have a full time staff receiving fixed salaries, it was successful and grew in size until in 1923, when an earthquake ruined the buildings. A new permanent hospital with 225 beds was erected the next year. In 1925 two thirds of the new buildings were destroyed by fire. With contributions by both Japanese and Americans a fireproof modern building then was erected. A million dollar contract was signed in 1928 for the first two units, and the cornerstone was laid on March 5, 1930. The school of nursing was authorized by the Imperial Government as a college in 1927. Later the Rockefeller Foundation gave the school a $400,000 endowment. When the American troops occupied Japan, the 42d U. S. Army General Hospital, brought from Manila, moved into St. Luke's and later was replaced by the 49th General Hospital, which continues to occupy the buildings and to provide medical care.

GENERAL KIRK RECEIVES HONORARY DEGREE

Major Gen. Norman T. Kirk, the Surgeon General, and other military leaders were awarded the honorary degree of Doctor of Laws by Columbia University at a special ceremony in New York, February 21. Among the others receiving this degree were Secretary of State George C. Marshall, Gen. Dwight D. Eisenhower, Fleet Admirals Ernest J. King, Chester W. Nimitz and William F. Halsey, Gen. Alexander A. Vandegrift, Vice Admiral Emory S. Land (retired) and Major Gen. Lewis B. Hershey. Gen. Douglas MacArthur and Gen. Henry H. Arnold were unable to attend. The degrees were conferred by the acting president of the university, Frank D. Fackenthal, Litt.D.

This is the citation accompanying General Kirk's degree: Norman Thomas Kirk, who as Surgeon General of the United States Army led the campaign against the hazards of battle; using every resource of speed and skill and research to preserve the lives and restore the health of fighting men; a soldier warring upon disease and disaster, and gaining an unprecedented, an almost unbelievable, victory: I gladly admit you to the degree of Doctor of Laws, *honoris causa,* in this university and confer on you all the rights and privileges which attach thereto.

COST OF ARMY RATION INCREASES 32 PER CENT

A War Department study indicates that the Army is spending up to 32 per cent more today to feed a soldier than it cost a year ago. The value of the garrison ration, which was 60.07 cents in January 1946, is now 79.88 cents. The field ration in the same period increased from 60.07 to 72.88 cents. The caloric value and general structure of the master menu in 1946 was not changed appreciably over that of the previous year, and while designed to yield about 3,800 calories it actually provided an average of 3,611 calories a day, such waste as bones, grease and trimmings representing a loss of about 5 per cent. A soldier was served over the period of a year 335 pounds of meat, 506 pounds of vegetables and potatoes, 281 pounds of milk and milk products, and 190 pounds of cereals and breads, the remaining 500 pounds of food including eggs, fats, beverages, fruits, dried fruits, sugar, citrus fruits and juices and condiments. Of the meat consumed nearly one third was beef.

NAME OF MEDICAL SCHOOL CHANGED

The Surgeon General of the Army has announced establishment of the name Army Medical Department Research and Graduate School. This school, which was formerly known as the Medical Department Professional Service Schools, will continue to be a part of the Army Medical Center. The Army Medical School, which is a part of this research and training center, was established in 1893 and has long been a source of important contributions to medical advancement.

PUBLIC HEALTH SERVICE

THE NATIONAL HEALTH COUNCILS

The U. S. Congress has designated three councils to make recommendations to the Surgeon General, U. S. Public Health Service, regarding means necessary to carry out his responsibilities in Public Law 410 and Public Law 487 of the 78th and 79th Congress respectively in the use of funds for research. The councils are the National Advisory Health Council, the National Advisory Cancer Council and the National Advisory Mental Health Council. Research projects approved by these councils will receive grants in aid for which applications may be made by individuals, medical schools, hospitals and public or private institutions. The membership of the National Advisory Health Council is as follows:

Gordon M. Fair, Graduate School of Engineering, Harvard University.
Edwin B. Fred, University of Wisconsin, Madison
A. Baird Hastings, Department of Biological Chemistry, Harvard Medical School
Carl S. Marvel, University of Illinois, Urbana
Kenneth F. Maxcy, School of Hygiene and Public Health, Johns Hopkins University, Baltimore.
Karl F. Meyer, director, George Williams Hooper Foundation for Medical Research, University of California Medical Center, San Francisco
John H. Musser, professor of medicine, Tulane University School of Medicine, New Orleans
Harry S. Mustard, Columbia University School of Public Health, New York
William C. Rose, Noyes Laboratory of Chemistry, University of Illinois, Urbana
Henry F. Vaughan, dean, School of Public Health, University of Michigan, Ann Arbor

The membership of the National Advisory Cancer Council is as follows:

Robert F. Stone, University of California Medical School, San Francisco
Charles B. Huggins, Department of Surgery, University of Chicago School of Medicine
Frank E. Adair, Memorial Hospital for the Treatment of Cancer and Allied Diseases, New York
A. C. Ivy, University of Illinois College of Medicine, Chicago
Shields Warren, Harvard University Medical School, Boston
Waltman Walters, Mayo Clinic, Rochester, Minn

The membership of the National Advisory Mental Health Council was published in The Journal, February 8, page 409.

FUNDS FOR RESEARCH ON MENTAL PROBLEMS

In accordance with recommendations of the National Advisory Mental Health Council, the U. S. Public Health Service announces that three types of grants may soon be available under the National Mental Health Act. These grants would provide funds for training, for research and for community services. The Public Health Service is now authorized to make grants to institutions offering training in psychiatry, clinical psychology, psychiatric social work and psychiatric nursing. Complete information may be obtained from the Mental Hygiene Division, U. S. Public Health Service, Washington 25, D. C. The National Advisory Mental Health Council expects to take final action on these applications by the middle of April. Interested schools are urged to make their applications.

The council has authorized the U. S. Public Health Service to grant a total of not more than 600 stipends this year to graduate students of psychiatry, clinical psychology, psychiatric social work and psychiatric nursing. The annual stipends range from $1,000 through $2,400 for clinical psychologists, psychiatric social workers and psychiatric nurses and up to $3,600 for psychiatrists. These awards will be made through the institutions collaborating in this phase of the training program of the U. S. Public Health Service. Applicants are requested not to write to training centers of the Public Health Service about these stipends until they are announced in May.

Grants for research relevant to problems of mental health may be made on the recommendation of the National Advisory Mental Health Council to public and private institutions and to individuals. Application forms are obtainable from the Research Grants Division, National Institute of Health, U. S. Public Health Service, Bethesda 14, Md. To assist in development of adequate mental health programs at the community level, grants-in-aid will be made to states on a matching basis. These funds are handled by the mental health authority of each state. Professional and lay people interested in specific service projects should bring their ideas to the attention of their state mental health authority. Funds to inaugurate actual operation of the programs depend on Congressional appropriations. The earliest date such funds may be available is July 1.

PUBLIC HEALTH NURSING WEEK

Marking the seventieth anniversary of public health nursing in the United States, Public Health Nursing Week will be celebrated April 20-26. The National Organization for Public Health Nursing, 1790 Broadway, New York 19, which is sponsoring the observance in cooperation with the U. S. Public Health Service, states that the objectives will be to recruit 8,000 public health nurses urgently needed throughout the country, to promote better understanding of public health nursing as a service for everybody regardless of size of income, and to encourage the organization of public health nursing services.

PERSONAL

Dr. W. V. Wallace, senior surgeon (reserve) U. S. Public Health Service, has become district public health officer with headquarters at Port Arthur, Texas, and also will be in charge of the quarantine station at Sabine, succeeding Dr. Roy Pitre, who resigned to enter private practice. Dr. Wallace served four years in the Navy during the recent emergency, attaining the rank of commander.

VETERANS ADMINISTRATION

NEW HOSPITAL AT TOMAH, WIS.

The 1,172 bed veterans hospital at Tomah, Wis., has been nearly completed, and Dr. G. D. Rice, veteran of some twenty-two years' service in veterans' hospitals, has been named manager of the hospital. Dr. Rice is a graduate of the University of Minnesota Medical School and is a veteran of World War I. The new hospital will occupy a 600 acre farm site. In addition to the ten new buildings, the hospital has taken over all buildings formerly used by the Department of Interior as an Indian boarding school, which buildings have been remodeled at a cost of more than $300,000.

$22,000,000 FOR A NEUROPSYCHIATRIC HOSPITAL

Army engineers have let construction contracts for the Veterans Administration neuropsychiatric 1,984 bed Franklin Delano Roosevelt Hospital at Peekskill, N. Y. Five different firms will build this hospital at a total cost of $22,400,456, the War Department has announced. The Peekskill installation is one of seventy-four hospitals and twenty-three major additions in the $770,000,000 program undertaken by the Army engineers for the Veterans Administration.

PERSONALS

Dr. Morris K. Smith, assistant professor, clinical surgery, Cornell University Medical School, has been appointed full time chief of the surgical service at the Veterans Halloran General Hospital, Staten Island, N. Y.

Dr. R. D. Green, for many years on the staff of the Veterans Hospital, Lincoln, Neb., has been assigned chief medical officer for the Veterans Administration at Sioux Falls, S. D., where a new veterans' hospital is being built.

Dr. James A. Brussell, assistant director, Willard State Hospital, Willard, N. Y., has been appointed consultant in neuropsychiatry to the Veterans Hospital at Sampson, N. Y.

Medical News

(Physicians will confer a favor by sending for this department items of news of more or less general interest: such as relate to society activities, new hospitals, education and public health.)

ALABAMA

Meeting of Obstetricians and Gynecologists.—The Alabama Association of Obstetricians and Gynecologists held its annual meeting February 20 in Birmingham. Guest speakers included Drs. F. Bayard Carter, Duke University School of Medicine; Dr. Willard R. Cooke, University of Texas Medical Branch, Galveston; Howard B. Lewis, Ph.D., University of Michigan Medical School, Ann Arbor, and Dr. George N. Papanicolaou, Cornell University Medical College, New York City.

CALIFORNIA

Mr. Gillespie Retires.—After twenty-eight years as chief of the Bureau of Sanitary Engineering, State Department of Health, C. G. Gillespie, Oakland, retired from state service in January. Mr. Gillespie was recently appointed special consultant to the sanitation study section of the National Institute of Health, Washington, D. C. *California's Health*, published by the state department of health, states that Mr. Gillespie "more than any other person is responsible for the development in California of the modern public health program in sanitary engineering."

John Fulton to Give the George Dock Lecture.—Dr. John F. Fulton, Sterling professor of physiology, Yale University School of Medicine, New Haven, Conn., since 1930, and author of the recent biography of Harvey Cushing, will deliver the annual George Dock lecture at the Los Angeles County Medical Association on March 17 at 8 p. m. His subject will be "Harvey Cushing and His Library." Dr. Fulton, a graduate of Harvard Medical School in 1927, was a member of the National Research Council during the war and directed much of the original work on the physiology of aviation.

Health Survey in Seven Cities.—The California State Departments of Public Health and Education are sponsoring a preliminary study of school absenteeism in seven California cities during the spring term. It will be under the direction of Bernice Moss, Ed.D., consultant in health education of the state department of education. The objectives are (1) to assemble data regarding the extent of illness among children together with the specific illnesses and other causes responsible for school absences and (2) to explore ways and means of utilizing these data in improving health teaching so that preventable illnesses may be reduced and the health of school children improved.

FLORIDA

Narcotic Violation.—Dr. Harry M. Elarbee, Pahokee, pleaded guilty in the U. S. District Court at Miami to violation of the Federal Narcotic Law Oct. 16, 1946, was sentenced to a term of fifteen months and placed on probation for a period of two years to commence after completion of his sentence.

Air Base Hospitals Taken Over by Tuberculosis Board.—By taking over two Army Air Base Hospitals the State Tuberculosis Board has provided Florida with six hundred additional beds and a total of three institutions devoted entirely to the hospitalization of tuberculosis patients. The Northwest Florida Tuberculosis Sanatorium, near Marianna, together with 145 acres of land, was originally the Army Air Base Hospital. Beds ready for occupancy number two hundred, and fifty more can be provided. The Southwest Florida Tuberculosis Sanitarium, Tampa, providing four hundred beds and a possible one hundred more, was formerly the Army Air Base Hospital at Drew Field and includes 160 acres of land. The board agreed that the present buildings will be used only until the legislature provides funds with which modern, compact plants can be built. Dr. William D. Rosborough, a graduate of the University of Pennsylvania College of Medicine who has special training in tuberculosis, will superintend the Marianna institution; Dr. Merlin H. Draper, for nineteen years superintendent at the Irene Byron Sanatorium, Fort Wayne, Ind., will superintend the one at Tampa. Dr. Rollen D. Thompson, superintendent of the Florida State Sanatorium at Orlando, has been made general superintendent over all state sanatoriums, but will retain his present position also. Two more sanatoriums remain to be provided in carrying out the plan of an institution for each of the five tuberculosis districts in the state.

ILLINOIS

Society for Mental Hygiene.—The annual meeting of the Illinois Society for Mental Hygiene will be held March 20 at the Standard Club, 320 South Plymouth Court, Chicago. Dr. Andrew C. Ivy, vice president, University of Illinois, in charge of professional schools, will give a physiologic interpretation of appetite.

Counties Without Hospitals.—The Illinois State Health Department, on completing a survey which included a study of 686 hospitals and nursing homes in Illinois, reports that 52 of the 102 counties in Illinois have no hospitals or have hospitals "in name only" without adequate modern facilities. Baxter K. Richardson, Springfield, senior administrative officer, said the survey showed that the southern part of the state had the greatest deficiency in hospital facilities, with twenty-eight counties having no hospital of any kind and twenty-four lacking institutions which could be classified as hospitals.

Committee on Purchase of Hospital Care.—Dr. Roland R. Cross, director of the Department of Public Health, Springfield, has appointed an eleven man technical advisory committee on the purchase of hospital care, which will serve certain governmental agencies. The Department of Public Health, hospital accounts analyst service in the division of maternal and child hygiene, will assume the responsibility for collecting and approving hospital cost analyses for these government agencies, which are the Division of Maternal Care and Child Hygiene (with EMIC and premature programs), the Division of Communicable Diseases (with the ophthalmia programs), the Division of Services for Crippled Children, Vocational Rehabilitation and the Illinois Public Aid Commission.

Chicago

Visit of Capetown Physiologist.—Dr. James T. Irving, head of the physiology department, University of Capetown, South Africa, is working for ten weeks at the University of Illinois College of Dentistry on tooth formation and calcification. Dr. Irving has written widely on carbohydrate metabolism, nutrition and tooth formation.

Experimental Neurosis.—At the January meeting of the National Advisory Health Council in Washington, D. C., the council approved a grant of $11,600 for a three year study of the neurophysiology of experimental neurosis to be conducted at Northwestern University Medical School under the direction of Dr. Jules H. Masserman, assistant professor of nervous and mental diseases.

Personal.—Dr. Andrew C. Ivy, vice president of the University of Illinois in charge of professional colleges, Chicago, has been elected to the board of directors of the John Crerar Library.——Dr. Paul L. Shallenberger, formerly on the staff of Wesley Memorial Hospital and instructor in medicine at Northwestern University Medical School, has joined the staff of the Robert Packer Hospital, Sayre, Pa. Dr. Shallenberger was recently released from service in the army with the rank of colonel.

Two Year Internship at Cook County Hospital.—Beginning July 1, Cook County Hospital will require two year internships to help offset the shortage of general practitioners. Dr. Karl A. Meyer, medical superintendent, said all young doctors at the hospital will be required to undergo this general training before being permitted to specialize. The hospital required an eighteen month internship before the war, but the time was cut to one year under the government's speed up program. The two year internship will include work in obstetrics, general diagnosis, gynecology, contagious diseases, psychiatry, pediatrics and eye, ear and throat ailments.

Irish Lectureship Established.—The first annual Henry E. Irish Lectureship will be given by Dr. Tom D. Spies, University of Cincinnati, at the University of Illinois College of Medicine, April 18 at 5 p. m. in room 221. The subject of the address will be "Modern Research in Nutrition." The lectureship is sponsored by Eta chapter of Alpha Kappa Kappa medical fraternity in honor of the late Dr. Henry E. Irish, a former professor of the University of Illinois College of Medicine and a member of the fraternity. The lectureship will be followed by the annual Tri-Chapter Banquet of the three Chicago chapters of the fraternity, at which Dr. Spies will be guest of honor, and Dr. Andrew C. Ivy, vice president of the University of Illinois, will be the principal speaker.

Institute for Study of Rheumatic Fever.—Gifts amounting to $60,000 have been received by Northwestern University Medical School for the establishment of an Institute for the Study of Rheumatic Fever. The grants, comprising $45,000 from the United States Public Health Service and $15,000 from the American Cyanamid Company, Lederle Laboratories division, were announced March 7 by Dr. J. Roscoe Miller, dean of the medical school. They represent initial funds for the project, which will require the full time services of at least nine, including as director Dr. Alvin F. Coburn, formerly assistant professor of medicine in the Columbia University College of Physicians and Surgeons, New York City. In the Rheumatic Fever Research Institute and its laboratories, housed on one floor set aside in the Municipal Contagious Disease Hospital, new knowledge of the mechanism of the disease and methods for prevention and treatment will be sought. It is planned to set up eight units in the institute, four in biology and an equal number in chemistry. In conjunction with the fundamental research work, the institute will have the services of additional investigators to engage in clinical research in collaboration with hospitals concerned with the care of rheumatic children. It is expected that the laboratories and other facilities will be completed and ready for operation by July.

KANSAS

Grants for Research at the Menninger Foundation.—At the January meeting of the National Advisory Mental Health Council in Washington, D. C., a grant of $26,500 was approved for a five year investigation of the use of hypnosis in psychotherapy and the nature of the hypnotic state under the direction of Margaret Brenman, Ph.D., and Dr. Merton M. Gill of the Menninger Foundation, Topeka. The council also approved a grant of $18,795.50 for a two year study of the early phases of personality development by Dr. Eunice M. Leitch of the Menninger Foundation.

Cancer Clinics for March.—A series of clinics on cancer arranged by the committee on control of cancer of the Kansas Medical Society, the University of Kansas School of Medicine, Lawrence-Kansas City, and the Kansas State Board of Health are being presented in five cities during March. Drs. Eldridge H. Campbell, professor of surgery, Albany Medical College, Albany, N. Y., and George G. Finney, assistant professor of surgery, Johns Hopkins University School of Medicine, Baltimore, present the course: March 8 and 9, Topeka; March 10 and 11, Salina; March 11 and 12, Hayes; March 13 and 14, Wichita, and March 15 and 16, Parsons. Physicians may register by sending a $5 fee to the University Extension Division, University of Kansas, Lawrence.

MASSACHUSETTS

Appoint Medical Director of Riggs Foundation.—Dr. Robert P. Knight, chief of staff of the Menninger Clinic in Topeka, Kan., has been appointed medical director of the Austen Riggs Foundation at Stockbridge, effective September 1, Ernest Stauffen Jr., New York City, chairman of the board of trustees, announced. Dr. Knight is a graduate of Northwestern University Medical School, Chicago, secretary of the American Psychoanalytic Association and a former president of the American Psychopathological Association. The foundation, established in 1919 by Dr. Austen Fox Riggs, provides psychiatric treatment, trains psychiatrists and conducts research in the field of psychotherapy. It also maintains a clinic in Pittsfield where consultative service is provided to community physicians and health, social and civic agencies.

Boston University Appointments.—New faculty appointments and promotions at the Boston University School of Medicine were announced February 17. In the department of medicine Dr. John P. Rattigan, assistant in medicine, was promoted to assistant professor, while Drs. James W. Culbertson, Edward D. Fries, William L. Hewitt, Dera Kinsey and George W. Waring were promoted from assistants in medicine to instructors. Dr. Burton C. Grodberg was promoted from assistant in gynecology to instructor. New appointments included Drs. Thomas L. Hartman, Boston, and Timothy R. Talbor Jr., Boston, instructors in medicine: Philip Kramer; Boston, Louis Bachrach, Maynard, William E. Greer, Boston, Thomas S. Perrin Jr., Samuel C. Cohen and Donald L. John, Boston, assistants in medicine. In surgery new appointments are Drs. John B. Graham, Newton, Donald F. Rayl, Pierre, S. D., Robert Bolduc, Worcester, and Joseph Stanton, Newton, assistants in surgery and John J. Byrne, Weston, instructor in surgery. Other appointments are Drs. Paul Massick, Boston, and Leslie R. Bragg, Webster, assistants in radiology; Lazarus Secunda, Boston, and Herbert I. Harris, Cambridge, instructors in psychiatry; John L. Morrison, Waltham, assistant in gynecology, and David B. Stearns, Boston, assistant professor in urology.

MICHIGAN

Crane Memorial Lecture.—The annual Crane Memorial Lecture was delivered by Dr. Lawrence Reynolds, Detroit, editor of the *American Journal of Roentgenology and Radium Therapy*, before the Kalamazoo Academy of Medicine, January 18, on "Medical Use of Radioactive Isotopes." The annual lecture honors the late Dr. Augustus W. Crane, pioneer in the field of roentgenology.

Syphilis Higher Among Teen Age Groups.—The syphilis rate among teen agers in Michigan in both rural and city areas is 33 per cent higher today than it was six years ago, according to figures released by the state health department. According to Dr. William DeKleine, state health commissioner, Lansing, investigations disclosed that the boys and girls had little or no knowledge of fundamental facts about venereal disease.

Director of Psychiatry Appointed.—The appointment of Dr. John M. Dorsey, special professor and chairman of the department of psychiatry at Wayne University College of Medicine, Detroit, as director of the psychiatric division of the City of Detroit Receiving Hospital was recently announced by the Detroit Common Council. Under the new arrangement the university's psychiatric students will work under the same director at the hospital as at the college in their research and training activities.

Food Poisoning—Cream Pies.—The state department of health laboratory reported February 18 that a hemolyticus organism in cream pies was responsible for the poisoning of 243 persons in Detroit over the preceding weekend. The cream pies were said to have been heavily contaminated, Dr. Joseph G. Molner, Detroit, deputy health commissioner, said. The company has stopped making cream pies. The health department examined 17 employees of the bakery to determine whether any of them might have caused the infections.

Department of Industrial Medicine.—A department of industrial medicine and training course for medical graduates covering all phases of industrial medicine is to be established at Woodward General Hospital, Detroit. It is intended to train doctors for service with the medical divisions of both large and small industrial plants. More than $400,000 has been collected toward building the $2,500,000 hospital to be built at Thirteen Mile Road near Woodward Avenue. Wayne University is collaborating with the advisory board of Woodward General Hospital medical staff in setting up the department and training staff.

County Society Approves Epileptic Clinic.—The council of the Wayne County Medical Society has approved the establishment of a proposed clinic for epileptic patients outlined in the report of the medical education committee. The purpose of the clinic is to investigate the problem of epilepsy by social and medical treatment of patients on an outpatient basis. Of the 7,000 epileptics in Detroit, only about 700 need institutional care, said Arthur J. Derbyshire, Ph.D., Detroit. The clinic will be financed by private contributions and income from patients who will be secured by referrals from private physicians and agencies. An advisory board set up by the Wayne County Medical Society will govern the medical policy.

MINNESOTA

E. Starr Judd Lecture.—The fourteenth E. Starr Judd lecture will be given by Dr. Isidor S. Ravdin, John Rhea Barton professor of surgery, University of Pennsylvania, April 15 at 8:15 in the auditorium of the Museum of Natural History, Minneapolis. Dr. Ravdin's subject is "Changing Concepts in Surgical Care." The late E. Starr Judd, an alumnus of the Medical School of the University of Minnesota, established this lectureship in surgery a few years before his death.

NEBRASKA

Personal.—Dr. John A. Waggener, 94, Humboldt, a practicing physician for 68 years until his recent retirement, was lately awarded the Humboldt Rotary Club's honorary membership for distinguished community service.

Grant to Continue Research.—Under a grant of $11,980 by the National Foundation of Infantile Paralysis, Dr. Archibald R. McIntyre, chairman, department of physiology and pharmacology, University of Nebraska College of Medicine, Omaha, will continue research on muscle physiology.

State Health Director.—Dr. Wallace S. Petty, Lincoln, has been reappointed state director of health. He joined the department in January 1942 after being in public health work in several Midwestern and Southern states. Dr. Petty graduated from Keokuk (Iowa) Medical College of Physicians and Surgeons in 1908 and did graduate work in public health at the University of Minnesota. In 1942 he was elected vice president of the International Society of Medical Health Officers at the American Public Health Association meeting in St. Louis.

NEW YORK

County Postgraduate Instruction.—Postgraduate instruction has been arranged by the council committee on public health and education of the Medical Society of the State of New York and the New York State Department of Health in March for the following counties:

March 11, Chenango County, 7 p. m., Norwich Club, Norwich, Dr. Frederick N. Marty, Syracuse University College of Medicine, Use of Blood and Blood Substitutes and Derivatives.

March 11, Nassau County, 4 p. m., Nassau Hospital, Mineola, Dr. William B. Sherman, Roosevelt Hospital, New York City, Allergy, and March 18, Dr. Stockton Kimball, dean, University of Buffalo School of Medicine, Treatment of Disorders of the Liver.

March 12, Otsego County, Tunnicliff Inn, Cooperstown, 6:30 p. m., Dr. Leslie A. Osborn, University of Buffalo School of Medicine, Recognition and Management of Psychiatric Problems in General Practice.

March 13, Jefferson County, 6:30 p. m., Hotel Woodruff, Watertown, Dr. Walter Modell, Cornell University Medical College, New York City, Management of the Failing Heart.

March 13, St. Lawrence County, 12 noon, Arlington Inn, Potsdam, Dr. Walter Modell, Management of the Failing Heart.

New York City

Changes in Status of Licensure.—The New York State Board of Medical Examiners on June 3 restored the state license to practice medicine to Dr. David Newman.

Herman M. Biggs Memorial Lecture.—Dr. Haven Emerson, emeritus professor of public health practice, Columbia University College of Physicians and Surgeons, will deliver the Herman M. Biggs Memorial Lecture April 3 at 8:30 p. m. at the New York Academy of Medicine on "The Hospital Survey and Construction Act and a Nationwide Health Program." The lecture, given at the concluding session of a three day institute on public health, is under the auspices of the committee on public relations.

Harvey Lectures. — The fifth Harvey Lecture of the current series at the New York Academy of Medicine was delivered February 20 by John J. Bittner, Ph.D., George Chase Christian professor of cancer research and director of the division of cancer biology, department of physiology, University of Minnesota, on "The Causes and Control of Breast Cancer in Mice." Dr. James L. Gamble, professor of pediatrics, Harvard Medical School, Boston, will deliver the sixth Harvey lecture at the Academy March 20 on "Physiological Information Gained from Study on the Life Raft Ration."

OHIO

Residency Opening.—Glenville Hospital, 701 Parkwood Drive, Cleveland 8, has announced a mixed residency opening July 1. Further information may be obtained by writing Arthur B. Harris, superintendent.

Dr. Zollinger to Head Clinical Surgery Department.—The appointment of Dr. Robert M. Zollinger, Columbus, as chairman of the department of clinical surgery in Ohio State University College of Medicine, Columbus, was announced recently. He replaces Dr. Verne A. Dodd, who has resigned to devote full time to other responsibilities as professor of surgery and chief of staff of Starling-Loving University Hospital. Dr. Zollinger is a graduate of Ohio State University. He taught previously at Harvard Medical School and was on the staff of the Peter Bent Brigham Hospital, Boston, before serving overseas as a colonel in the medical corps in the recent war.

PENNSYLVANIA

Secretaries-Editors Conference.—The 1947 secretaries-editors conference will be held this year in Harrisburg the afternoon and evening of March 20 and the morning of March 21. The president of each county society and the chairman of each county society's committees on public health legislation, medical economics and public relations will be guests of the state medical society at the conference. Speakers from national, state and county medical societies will discuss public relations, pending health legislation, voluntary insured medical service and medical service for veterans. A panel forum is planned for Friday morning.

Philadelphia

Personal.—Dr. William F. Brehm has joined the staff of Robert Packer Hospital, Sayre, Pa. Dr. Brehm recently was released from service in the army and since then has been working as an anesthetist with Dr. Henry S. Ruth in Philadelphia.

Grants to Temple University. — The National Cancer Institute of Bethesda, Md., has made a grant of $10,000 to the Temple University School of Medicine and Hospital for the study of the relationship of cellular injury to the development of repair and neoplastic tendencies. Another grant of $20,750 a year has been received from the U. S. Public Health Service for an investigation of the heart and circulation.

SOUTH CAROLINA

Dr. Guerry Honored. — A bronze plaque bearing Dr. LeGrand Guerry's name was unveiled when the northwest wing of Columbia Hospital, Columbia, was dedicated January 20. Dr. George H. Bunch Sr. delivered the address before the hospital board of trustees, members of the Columbia Medical Society and other guests. Dr. Guerry is a graduate of the University of Georgia School of Medicine, Augusta, and is a past president of the Southern Surgical Association. He has been associated with the hospital for nearly fifty years.

Funds for Planning Health Projects. — The Federal Works Agency has granted South Carolina more than $400,000 to finance the planning of one hundred and twenty health facility projects with a final cost of over $13,000,000, according to H. M. McElveen, special representative of the state board of health. The largest approved project is the Charleston County Tuberculosis Association's $750,000 plan for a new tuberculosis hospital. Counties have been urged by the state board of health to file projects for health center buildings if present facilities are not adequate, and state health officials will help in planning and obtaining approval.

TEXAS

Dr. Cary Honored on 75th Birthday.—The Southwestern Medical Foundation was host at a dinner in Dallas, February 28, given in celebration of the 75th birthday of Dr. Edward Henry Cary. Among those present were Dr. Elmer L. Henderson, Louisville, Ky., president of the Southern Medical Association, who spoke on "Contributions to Medicine in the South"; Dr. Charles Gordon Heyd, New York City, whose subject was "The Expansive Force of Medical Education"; Dr. Morris Fishbein, Chicago, whose subject was "The Medical Profession's Benefactor"; Dr. Harrison H. Shoulders, Nashville, Tenn., President of the American Medical Association, who spoke on "American Medicine's Elder Statesman," and Dr. John G. Young, president, Dallas County Medical Society, "Viewed Through the Eyes of the Dallas Medical Profession." Among many honors which have been bestowed on Dr. Cary in his long and distinguished career have been the presidencies of the Dallas County, Texas State, Texas Ophthalmological and Otological, Southern Medical and the American Medical associations. He has been president of the executive board of the National Physicians Committee, the Philosophical Society of Texas, the Medical Arts Hospital and the Group Hospital Service. He was for many years dean of Baylor University Medical School and professor of ophthalmology. During World War I Dr. Cary organized the Baylor Medical and Surgical Unit, which served with distinction in France. In 1939 he and a group of Dallas business men organized the Southwestern Medical Foundation, which shortly thereafter launched the Southwestern Medical College. The community in which Dr. Cary has lived for so many years recently bestowed on him for his service to the community the Linze Award. President Umphrey Lee of Southern Methodist University, Dallas, at the end of the banquet presented to Dr. Cary the sum of $20,000 for scholarships in his name.

WASHINGTON

Course for Food Handlers.—A course in food handling required by the county food ordinances for any person working in a food establishment started January 27 in Vancouver. Classes will meet each Monday afternoon and evening through April 14. Organizations responsible for sponsoring the course are Clark County District Health Department, the southern division of the Washington State Restaurant Association, the Vocational Education Division and Culinary Alliance Local No. 425.

WISCONSIN

Brief Intensive Course in Pediatrics.—The University of Wisconsin Medical School, Madison, is again presenting a brief intensive course in pediatrics for the general practitioner. It will be held April 7 to 11 at the medical school and the State of Wisconsin General Hospital, Madison. Material includes diabetes mellitus in children, infant-feeding problems and the feeding of the premature infant, renal disease in children, hemolytic anemia due to Rh incompatibility, respiratory diseases and tuberculosis in childhood, ringworm infection in children and the technic of intravenous and bone marrow transfusion. The course will be under the direction of Drs. John E. Gonce Jr., professor of pediatrics; Horace K. Tenney Jr. and Kenneth E. McDonough of the pediatric division. Details may be obtained from Dr. Llewellyn R. Cole, Coordinator of Graduate Medical Education, The University of Wisconsin Medical School, 418 North Randall Avenue, Madison 6.

CANADA

Personal.—Dr. C. B. Weld, professor of physiology at Dalhousie University Faculty of Medicine, Halifax, N. S., has been elected president of the Canadian Physiological Society.

Provincial Minister of Health Appointed.—The appointment of Dr. Donald Griffith McKerracher, Barrie, Ont., as provincial psychiatrist and commissioner of mental services in Saskatchewan was recently announced by the minister of health. Dr. McKerracher has served with the Ontario Department of Public Health.

Appoint Professor of Medicine.—Dr. Clyde W. Holland, Halifax, Nova Scotia, has been appointed the J. C. Troy professor of medicine and head of the department at Dalhousie University. Dr. Holland has been director of the student health service, Dalhousie University, since 1931 and is also attending physician at Victoria General Hospital and consulting physician at Grace Maternity Hospital. This chair in medicine was founded by the late Hon. J. C. Troy, former lieutenant governor of the province, who bequeathed the residue of his estate to the university to be used for medical research.

GENERAL

Homer Folks Resigns.—Homer Folks, New York City, after serving more than half a century as secretary of the State Charities Aid Association, has resigned. No successor has yet been named. Mr. Folks's contributions in the field of public health and social service include pioneering activities in organized movements for improvements of public institutions for the care of children, for public relief, for the prevention of tuberculosis and for the promotion of preventive medicine and mental hygiene.

Orthoptic Council Examinations.—The next examination for technicians by the American Orthoptic Council will be held in September-October. The written examinations on Friday, September 12, will be held at various cities in the country. Only those passing the written examinations will be permitted to take the oral and practical tests to be given in Chicago, Saturday, October 11. Applications on official forms must be received before July 1. Address the American Orthoptic Council, 23 East 79th Street, New York 21.

Colonel Craig Resigns as Editor.—The resignation of Col. Charles Franklin Craig, San Antonio, as editor of the *American Journal of Tropical Medicine* was announced in the February issue of *Tropical Medicine News*. Colonel Craig, who has been editor for over twenty years, received his M.D. degree from Yale Medical College in 1894 and for many years was a member of the U. S. Army Medical Corps. He served as professor of bacteriology and parasitology and preventive medicine and director of laboratories, Army Medical School, Washington, D. C., 1920-1922. Later he served on the faculty of Tulane University of Louisiana School of Medicine, New Orleans, as professor of tropical medicine and director of the department.

Practical Nurse Training Programs.—The U. S. Office of Education has made a study of the practical nurse occupation. The president of the American Association for Practical Nurses Education was chairman of the committee, and Arthur B. Wrigley, state supervisor of trade and industrial education in New Jersey, was director of the study. The committee represented national nursing, hospital, public health and educational organizations and the trained practical nurse group. The report, entitled "Practical Nursing—An Analysis of the Practical Nurse Occupation with Suggestions for the Organization of Training Programs," Misc. No. 8, can be purchased from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C., for 55 cents.

Association for Study of Goiter.—The American Association for the Study of Goiter will meet April 3-5 under the presidency of Dr. W. B. Mosser, Kane, Pa., at the Biltmore Hotel, Atlanta, Ga. At a joint meeting of the association and the Fulton County Medical Association at the Academy of Medicine, Dr. Arnold S. Jackson, Madison, Wis., will speak on "Traditions in Surgery" and Dr. John Hertz, Copenhagen, Denmark, on "Studies of Thyrotoxicosis." Among subjects to be discussed by leaders in this field throughout the country are indications for surgery in hyperthyroidism, evaluation of newer methods of treatment of thyrotoxicosis, directions of present day thyroid research, possible use of radioactive iodine in the diagnosis of thyroid disease, thyrotoxicosis without elevated metabolism and thiouracil and related substances in the treatment of toxic goiter.

Graduate Training in Psychoanalysis.—The Psychoanalytic Clinic for Training and Research, department of psychiatry, College of Physicians and Surgeons, Columbia University, New York, offers a three year graduate residency training program in psychoanalytic medicine to qualified physicians. On fulfilment of the requirements, students will be awarded a certificate of training in psychoanalytic medicine. Students who, in addition, undertake satisfactory investigative work and pass a supplementary examination in the related basic sciences may also be awarded the advanced degree of Doctor of Medical Science. The intramural psychiatric residency starts on July 1, and the required courses of lectures and seminars start on October 1. Those who have already completed two years' residency in a mental hospital recognized by the American Medical Association will be allowed credit.

Borden Awards.—Nine American scientists have received Borden Awards of a gold medal and $1,000 for exceptional contributions to scientific research during 1946. The awards are administered by eight professional and scientific associations. Among the associations and the 1946 recipients are the American Chemical Society, Ira A. Gould Jr., Ph.D., professor of dairy manufacturing, University of Maryland, for studies in the changes in milk and milk products; American Academy of Pediatrics, Dr. James L. Gamble, professor of pediatrics, Harvard Medical School, Boston for pioneer work in the field of salt and water balances in the human body; the American Institute of Nutrition, Dr. Philip C. Jeans, professor and head of pediatrics, and Genevieve Stearns, Ph.D., research professor of pediatrics, both of State University of Iowa College of Medicine, Iowa City, for fundamental contributions in the field of child nutrition and for research on the nutritive value of milk.

Scholarships for Prevention of Blindness.—The National Society for the Prevention of Blindness announces the establishment of nine one year scholarships of $1,000 each for students interested in professional education to qualify for positions in sight conservation and prevention of blindness. Positions are open in public and private prevention of blindness agencies, hospitals and organizations offering medical care programs. The positions require both community organization and case work skills. Scholarships will be available beginning in the spring term of 1947. Applications may be secured by writing the National Society for the Prevention of Blindness, 1790 Broadway, New York 19. In addition, the Delta Gamma Fraternity of College Women has announced the establishment of a fund for scholarships in the fields of prevention of blindness and sight conservation exemplified by specialized prevention study, training of orthoptic technicians, training of teachers for sight-saving classes and training of workers for the preschool blind. Information on basic qualifications for the various fields of the Delta Gamma scholarships may be secured from Mrs. Richard P. Miller, 39 West Jefferson Road, Pittsford, N. Y.

Marriages

Sidney Prystowsky, Charleston, S. C., to Miss Grace Buchstane of West Hartford, Conn., in Hartford October 20.

Anthony Rullan, Yauco, Puerto Rico, to Miss Jane Barbara Hryhorczuk of New York August 3.

Robert Yates Hayne Thomas to Miss Mary Bolling Duncan, both of Jacksonville, Fla., in October.

Bill Morris Phillips to Miss Marjoria Elaine Prestridge, both of Bogue Chitto, Miss., October 17.

David William McLean, to Miss Eleanor Virginia Myers, both of Meridian, Miss., in October.

John Roy Hege Jr., Raleigh, N. C., to Miss Dorothy White Huff of Birmingham, Ala., recently.

De Forest E. Hale, Manlius, N. Y., to Miss Alice Barker of Clifton Springs in September.

Alvis Joe Scull Jr. to Miss Gloria Robison, both of Houston, Texas, September 17.

Joseph Brannen Ganey to Miss Eleanor Mays Bass, both of Bradenton, Fla., October 19.

Paul Irving Ossen to Mrs. Bernice Ossen, both of Quincy, Mass., October 20.

Deaths

Clarence Martin Jackson ⊕ Minneapolis; born in What Cheer, Iowa, April 12, 1875; University of Missouri School of Medicine, Columbia, 1900; an affiliate Fellow of the American Medical Association; president of the Minnesota State Board of Examiners in the Basic Sciences; since 1941 professor emeritus of anatomy at the University of Minnesota Medical School, where he had been professor and head of the department of anatomy since 1913; first became associated with the school in 1900 as assistant professor of anatomy, became professor in 1902 and head of the department in 1913; served as dean from 1909 to 1913; in 1917-1918 and in 1925 dean of the University of Minnesota Graduate School, where he was professor of anatomy; at one time secretary of the Missouri State Anatomical Board; formerly professor of anatomy and head of the department at the University of Missouri and later appointed dean of the medical school; in 1923-1924 chairman of the medical division of the National Research Council; past president and served as chairman of the committee on anatomic nomenclature, American Association of Anatomists; the local chapter of Phi Beta Pi medical fraternity, of which he was a member, for several years sponsored the annual "Jackson Lecture," in which many distinguished scientists participated; in 1923 awarded the LL.D. degree by the University of Missouri in recognition of his services to education; author of "Effects of Inanition and Malnutrition upon Growth and Structure"; co-author of the "Measurement of Man" ; at one time editor of Morris's Human Anatomy; died January 17, aged 71, of Parkinson's disease.

Frank Earl Bass, Shelbyville, Ind.; Medical College of Indiana, Indianapolis, 1903; member of the American Medical Association; served as secretary-treasurer of the Shelby County Medical Society; died January 4, aged 65, of carcinoma.

Roger Bernard Brewster, Siloam Springs, Ark.; Kansas City (Mo.) Medical College, 1905; formerly on the staff of the Kansas City General Hospital in Kansas City, Kan., where he had been physician for the Missouri Pacific Railroad and the Kansas City Gas Company; served during World War I; died January 6, aged 71, of lobar pneumonia.

Michael Brown, Dalton, Ky.; University of Louisville (Ky.) Medical Department, 1890; died January 12, aged 83, of heart disease.

Fred Welden Caudill ⊕ Louisville, Ky.; University of Louisville School of Medicine, 1926; commissioned passed assistant surgeon in the U. S. Public Health Service in 1927; formerly health officer of Scott and Perry counties; served as epidemiologist of the state health department; on the staff of Crippled Children and Children's Free hospitals; died January 12, aged 46, of encephalitis.

Clarence Alonzo Cheever, Boston; Harvard Medical School, Boston, 1883; member of the American Medical Association; died Dec. 31, 1946, aged 88, of cerebral hemorrhage.

Harry Louis Claassen ⊕ Cincinnati; University of Cincinnati College of Medicine, 1918; professor of dermatology at his alma mater; specialist certified by the American Board of Dermatology and Syphilology; member of the American Academy of Dermatology and Syphilology; director of the department of dermatology at the Cincinnati General Hospital; died January 11, aged 54, of coronary occlusion.

William Jasper Curry, Rogers, Ark. (licensed in Arkansas in 1903) ; member of the American Medical Association; health officer; died January 4, aged 95, of heart disease.

Isaac Davis ⊕ Pittsburgh; Johns Hopkins University School of Medicine, Baltimore, 1914; died Dec. 25, 1946, aged 58.

George Claude Dittman ⊕ St. Paul; University of Minnesota College of Medicine and Surgery, Minneapolis, 1904; served during World War I; affiliated with St. Joseph Hospital, where he died January 9, aged 64, of cardiac infarction.

Stephen Edward Donlon ⊕ Chicago; Rush Medical College, Chicago, 1895; an affiliate Fellow of the American Medical Association; fellow of the American College of Surgeons; at one time on the faculty of his alma mater; on the staff of St. Anthony de Padua Hospital; died January 6, aged 82, of cerebral hemorrhage.

Earl Bishop Downer, Youngstown, Ohio; Ohio Medical University, Columbus, 1907; U. S. Army Medical School in 1914; at one time instructor at the Ohio Medical University; served as American Red Cross surgeon in Belgrade, Serbia, during the typhus epidemic and German invasion; director of the Edwin Gould Relief Mission to Russia; formerly on the staff of St. Elizabeth's Hospital; author of several books; died January 1, aged 61, of coronary thrombosis.

George Estle Embry, Morgantown, Ky.; University of Louisville Medical Department, 1910; member of the American Medical Association; died January 10, aged 60, of cerebral hemorrhage.

Hannibal Claude Fortune, Payson, Ill.; St. Louis University School of Medicine, 1905; veteran of the Spanish-American War; died January 4, aged 74, of coronary thrombosis.

George Freiman ⊕ Brooklyn; Long Island College Hospital, Brooklyn, 1914; clinical professor of ophthalmology at his alma mater; specialist certified by the American Board of Ophthalmology; member of the American Academy of Ophthalmology and Otolaryngology; member of the courtesy staff of the Brooklyn Eye and Ear Hospital; fellow of the American College of Surgeons; served during World War I; affiliated with the Long Island College Hospital, where he died January 3, aged 53, of coronary occlusion.

Oliver George Grady, Orrville, Ohio; Starling-Ohio Medical College, Columbus, 1909; member of the American Medical Association; served during World War I; president of the county health department; died in the City Hospital, Massillon, January 11, aged 62, of carcinoma of the bladder.

Daniel Heimlich ⊕ Los Angeles; Western Reserve University Medical Department, Cleveland, 1892; member of the Ohio State Medical Association; served during World War I; died in the Cedars of Lebanon Hospital January 7, aged 78, of coronary sclerosis.

Maurice Alphonsus Regis Hennessy, Cleveland; St. Louis University School of Medicine, 1926; member of the American Medical Association, American Psychiatric Association and the American Orthopsychiatric Association; specialist certified by the American Board of Psychiatry and Neurology; demonstrator of nervous diseases at Western Reserve University School of Medicine; on the staff of St. Vincent Charity Hospital; died Dec. 31, 1946, aged 46, of heart disease.

Samuel W. Hervey, Fortville, Ind.; Medical College of Indiana, Indianapolis, 1887; Medical College of Ohio, Cincinnati, 1891; member of the American Medical Association; died in the Methodist Hospital, Indianapolis, January 8, aged 81, of abdominal carcinomatosis.

John Elmer Hughes ⊕ Shawnee, Okla.; Northwestern University Medical School, Chicago, 1906; past president of the Pottawatomie County Medical Society; later founder and co-owner of the Anderson, Carson and Hughes Hospital; on the courtesy staff of the Shawnee Municipal Hospital; on the staff of the Shawnee Indian Sanatorium; division radiologist for the Rock Island Railway; died off the coast of Acapulco, Mexico, January 15, aged 68, of coronary occlusion.

Robert James Hutchinson ⊕ Grand Rapids, Mich.; Detroit College of Medicine, 1896; fellow of the American College of Surgeons; affiliated with the Blodgett Memorial Hospital, St. Mary's Hospital and Butterworth Hospital, where he died January 8, aged 77, of glomerular nephritis and hypertension.

Victor Eugene Kaufman, Canton, Ohio; Starling-Ohio Medical College, Columbus, 1912; died January 9, aged 67, of coronary embolism.

Joseph Henry Kerrigan ⊕ Manchester-by-the-Sea, Mass.; Tufts College Medical School, Boston, 1907; a member of the board of health in Stoneham and the school committee; served during World War I; past president of the Middlesex East District Medical Society; on the staff of the Choate Memorial Hospital, Woburn, and on the associate staff of the Winchester (Mass.) Hospital; died in Miami, Fla, January 3, aged 61, of heart disease.

Thomas Otis Klingner, Springfield, Mo.; Missouri Medical College, St. Louis, 1898; member of the American Medical Association and of the American Academy of Ophthalmology and Otolaryngology; specialist certified by the American Board of Ophthalmology; on the staffs of the Louise G. Wallace Hospital, Lebanon, Springfield Baptist Hospital, St. John's Hospital, City Hospital and the Burge Hospital, where he died January 7, aged 72, of carcinoma.

Sylvester Maxwell Lambert ⊕ Walnut Creek, Calif.; Syracuse University College of Medicine, 1908; an Associate Fellow of the American Medical Association; served for many years in the South Sea Islands with the International Health Division of the Rockefeller Foundation; author of "A Yankee Doctor in Paradise" died January 10, aged 64, of heart disease.

Harold Arthur Morris, Brooklyn; Long Island College Hospital, Brooklyn, 1907; member of the American Medical Association; fellow of the American College of Surgeons; affiliated with the Swedish Hospital in Brooklyn and the Harlem Valley State Hospital in Wingdale; died January 17, aged 62, of cerebral thrombosis.

Joseph Andrew Novelli ⊕ Brooklyn; Fordham University School of Medicine, New York, 1918; on the staff of the Evangelical Deaconess Hospital, where he died January 14, aged 53, of coronary thrombosis.

Julius E. Pinguely, Melbourne, Ky.; Medical College of Ohio, Cincinnati, 1888; member of the American Medical Association; died in the Speer Memorial Hospital, Dayton, January 16, aged 88, of gastric hemorrhage.

Rosa Caldwell Turnbull Powell, Grants Pass, Ore.; Cleveland Homeopathic Medical College, 1904; member of the American Medical Association; died January 6, aged 74, of heart disease.

William Lightfoot Powell, Palmyra, Ill.; Bennett Medical College, Chicago, 1897; died in the Macoupin Hospital, Carlinville, Dec. 25, 1946, aged 86, of cerebral hemorrhage.

George S. Price, Fairport, N. Y.; Eclectic Medical Institute, Cincinnati, 1892; member of the American Medical Association; served during World War I; formerly county coroner, health officer of Fairport and secretary of the board of health; at one time treasurer of the New York State Health Officers Association; served on the staff of the Genesee Hospital, Rochester, N. Y.; died January 18, aged 78, of cerebral hemorrhage.

Michael Leo Ravitch, New York; University of Moscow Faculty of Medicine, Russia, 1889; Central Medical College of St. Joseph, Mo., 1895; consulting dermatologist to Camp Zachary Taylor, Ky., during World War I; formerly on the staffs of the Michael Reese Hospital, Chicago, and the Eastern Kentucky Insane Asylum and Jewish Hospital in Louisville, Ky.; author of "Romance of Russian Medicine" died January 11, aged 79, of coronary thrombosis.

Mark S. Reuben, New York; Columbia University College of Physicians and Surgeons, New York, 1906; at one time assistant and associate in pediatrics at his alma mater; formerly chief of clinic, pediatric department of Vanderbilt Clinic; served as associate in pediatrics and visiting pediatrician at the Beth Israel Hospital; died January 15, aged 63, of coronary sclerosis and pernicious anemia.

David Robins ⊕ Newark, N. J.; University and Bellevue Hospital Medical College, New York, 1905; for many years an examining physician for the health department and the board of education; member of the staff of the City Hospital; died in the Newark Beth Israel Hospital January 16, aged 61, of sarcoma.

William Nicholas Senn, Chicago; Rush Medical College, Chicago, 1900; member of the American Medical Association; served during the Spanish-American War and World War I; at one time on the faculty of his alma mater; on the staffs of the Presbyterian and St. Joseph's hospitals; died in Wesley Memorial Hospital January 2, aged 70, of bronchopneumonia and arteriosclerosis.

Adelard Simard, Saginaw, Mich.; M.B., School of Medicine and Surgery of Montreal, Faculty of Medicine of the University of Laval at Montreal, 1905 and M.D. in 1906; died Dec. 6, 1946, aged 79.

Claude Adams Stearns ⊕ Alto Pass, Ill.; Barnes Medical College, St. Louis, 1911; died in Anna, Dec. 2, 1946, aged 61, of pneumonia.

George Brinton Sturgeon, Orwell, Ohio; Homeopathic Hospital College, Cleveland, 1892; died Dec. 1, 1946, aged 81, of cerebral embolism.

Joseph Thompson, Cleveland; University of Wooster Medical Department, Cleveland, 1906; member of the American Medical Association; affiliated with St. Ann's Maternity Hospital; died in Hershey, Pa., Dec. 22, 1946, aged 61, of coronary thrombosis.

Olga C. Thoren, Chicago; Bennett Medical College, Chicago, 1900; died January 13, aged 74, of carcinoma of the stomach.

W. E. Ticen, Mooreland, Ind.; Indiana Medical College, School of Medicine of Purdue University, Indianapolis, 1906; affiliated with the Henry County Hospital in New Castle; died January 4, aged 71, of coronary thrombosis.

George Connor Trawick, Chesterfield, Mo.; Vanderbilt University School of Medicine, Nashville, Tenn., 1899; local medical director of the Equitable Life Assurance Society of the United States; died in Jefferson Barracks, Mo., Dec. 7, 1946, aged 67, of heart disease.

Carden Frederick Warner ⊕ Washington, D. C.; Hahnemann Medical College and Hospital of Philadelphia, 1904; served on the staff of the National Homeopathic Hospital; died Dec. 5, 1946, aged 64, of coronary thrombosis.

George S. Wells, Santa Barbara, Calif.; Pulte Medical College, Homeopathic, Cincinnati, 1891; fellow of the American College of Surgeons; died Dec. 3, 1946, aged 83, of dissecting aneurysm of the abdominal aorta.

Fred Donnell West, Beaumont, Calif.; Ohio Medical University, Columbus, 1903; member of the American Medical Association; died Nov. 24, 1946, aged 69.

Abraham E. White, Philadelphia; University of Pennsylvania Department of Medicine, Philadelphia, 1890; died Dec. 29, 1946, aged 86, of heart disease due to carcinoma of the prostate.

Charles M. White, Clinton, Ind.; Jefferson Medical College of Philadelphia, 1876; member of the American Medical Association; at one time mayor of Clinton; on the staff of the Vermillion County Hospital, where he died January 2, aged 93, of senility.

Joel Govan Williams, Norway, S. C.; Baltimore Medical College, 1890; died Dec. 12, 1946, aged 85, of heart disease.

John Williams Wilson, Monticello, Miss.; Medical Department of Tulane University of Louisiana, New Orleans, 1909; member of the American Medical Association; served during World War I; died in the Mississippi Baptist Hospital, Jackson, Dec. 8, 1946, aged 61, of carcinoma of the stomach and liver.

Calvin Homer Wyker ⊕ Columbus, Ohio; Starling-Ohio Medical College, Columbus, 1909; on the staff of the Grant Hospital; died Dec. 23, 1946, aged 63, of metastatic epithelioma.

Eugene L. Youngue, Lakin, W. Va.; Leonard Medical School, Raleigh, N. C., 1908; medical superintendent of the Lakin State Hospital; died Dec. 24, 1946, aged 61, of coronary heart disease.

DIED WHILE IN MILITARY SERVICE

Arnold Breckenridge ⊕ Lieutenant M. C., U. S. Navy, Chapel Hill, N. C.; McGill University Faculty of Medicine, Montreal, Que., Canada, 1942; interned at St. Mary's and Naval hospitals in San Francisco; began active duty as a lieutenant (jg) in the medical corps of the U. S. Navy in 1943; promoted to lieutenant; a flight surgeon; died in Santa Ana, Calif., May 3, 1945, aged 29, in an explosion and crash of naval aircraft.

Ralph Edward Costanzo, Stamford, Conn.; Bennett Medical College, Chicago, 1914; member of the American Medical Association; served overseas during World War I; began active duty as a captain in the medical reserve corps of the U. S. Army in April 1941; assigned to Fort H. G. Wright, N. Y., where he was promoted to the rank of major and appointed post surgeon; died in the Stamford Hospital Dec. 26, 1946, aged 59, of coronary occlusion while on leave.

Howard Earling, Seattle; McGill University Faculty of Medicine, Montreal, Que., Canada, 1940; interned at the Charity Hospital in New Orleans and the Seattle General Hospital; began active duty as a lieutenant (jg) in the medical corps of the U. S. Naval Reserve on Dec. 21, 1942; promoted to lieutenant and lieutenant commander; died April 21, 1946, aged 42, of a malignant tumor.

Frederic Reid Fenno, Syracuse, N. Y.; Syracuse University College of Medicine, 1938; interned at the Boston City Hospital; began active duty as a first lieutenant in the medical reserve corps of the U. S. Army in February 1941; promoted to captain; served in this country, Africa, Italy and Burma; died in Bermuda July 20, 1945, aged 30, of acute hepatitis.

William Robert Galbreath ⊕ Bloomsburg, Pa.; University of Nebraska College of Medicine, Omaha, 1916; fellow of the American College of Surgeons; formerly resident physician at the Presbyterian Hospital in San Juan, P. R.; served during World War I; began active duty as a lieutenant colonel in the medical corps, Army of the United States, in July 1942 and, chief of the surgical service at the Station Hospital in Fort Eustis, Va.; later became commanding officer of the Station Hospital at Camp Patrick Henry, Hampton Roads; promoted to colonel; received a certificate of commendation for his services at Camp Patrick Henry; died in the Valley Forge General Hospital, Phoenixville, Nov. 3, 1946, aged 61, of myocardial infarction while on terminal leave.

Julius Robert Kaufman, St. Louis; St. Louis University School of Medicine, 1931; member of the American Medical Association; interned at St. Louis City Hospital; began active duty as a captain in the medical corps, Army of the United States, in July 1942; died in the Oakland (Calif.) Regional Hospital July 14, 1946, aged 39, of hernia.

British Association Decides to Negotiate With the Minister of Health

As anticipated in the preceding letter, the representative meeting of the British Medical Association has decided to negotiate with the government in regard to the National Health Service, in accordance with the recommendation of the council. In moving a resolution to this effect Dr. Dain, chairman of the council, said that this alteration of the council's first recommendation (to refuse to negotiate) did not mean any weakening in its policy of opposition to the act as it stands. In no sense was it a climb down. It was obvious that the letters of the presidents of the Royal Colleges, the plebiscite and the council's strong recommendation not to negotiate had produced in the minister of health a more conciliatory attitude than he had hitherto shown. His weakening on the question of a basic salary was helpful. The council proposed to discuss the conditions of a complete health service comprehensively and not to be bound by the terms of the act. If the minister refused to negotiate, no harm had been done and the association had the opportunity of putting itself right with the public.

Much opposition to the proposal to negotiate was made in the discussion which followed. It was argued that the act violated the principles set out by the council as fundamental. On the other hand, it was argued that the majority against negotiation obtained in the plebiscite was not great and that diplomacy rather than brute force was indicated. The amendment not to negotiate was defeated by a large majority. Lord Horder then moved an amendment "that the association confirms the already expressed policy in that it is anxious and willing to cooperate with the government in evolving the best possible health service for the country and realizes that this cooperation will require some new legislation." He held it to be vital that the minister should be aware from the first of the necessity for some fresh legislation. This amendment also was lost by a large majority. A vote was taken on the resolution of the council to negotiate, and this was carried by a majority of 252 to 17.

A New Safety Code for Anesthetic Apparatus

The Medical Defense Union, which has had to deal with many legal actions following the fatal administration of anesthetics, recently arranged a conference to discuss methods of minimizing errors in the use and assembly of anesthetic apparatus. A committee was formed consisting of representatives of the union, the Association of Anesthetists and the manufacturers of anesthetic apparatus and gases. The committee has put forward both a short term and a long term policy. The former includes plans for the distinctive marking of cylinders and pipes, planned storage, and the selection and instruction of personnel. The long term policy calls for a complete system of noninterchangeable connections for gas apparatus, which will make wrongful coupling impossible. But this will require the introduction and universal use of a new type of cylinder valve, with consequent changes of the apparatus attached to the cylinders. Until such time as this foolproofing can be done, the risk of a wrong connection must remain, but a code has been formulated which should reduce the risk to a minimum.

A British Standard Code of Practice has been prepared under the authority of the Chemical Engineering Divisional Council in response to the joint request of the Medical Defense Union and the Association of Anesthetists. This code lays down a color scheme for cylinders used for anesthetic gases, oxygen therapy and other medical purposes. Thus for a cylinder containing carbon dioxide for inhalation the upper three fourths is sea green and the lower fourth black; for making snow the cylinder is sea green throughout. For cyclopropane the color of the cylinder is aluminum, for ethylene mauve, for helium brown, for nitrous oxide black, and for oxygen black with a white shoulder. It is also recommended that no cylinder should be encased in any covering; that the encircling label should be in the characteristic color with the name of the gas. The visible connecting tubing should also bear the identification color.

Is Pleurisy with Effusion an Indication for Artificial Pneumothorax?

Two studies undertaken in different hospitals in Norway suggest that the answer to this question is still to a certain extent in dispute. Drs. Anton Jervell and Boye Istre of the Vestfold Hospital have undertaken a follow-up study of 143 cases of primary exudative pleurisy after an observation period of one to five years and with a subsequent tuberculosis morbidity of 7.7 per cent. A close analysis of the 11 patients developing pulmonary tuberculosis showed that in only 3 of them would pneumothorax treatment possibly have been of value. So they have little to say in favor of it. But Dr. P. Agnar Nilsen of the Drammen City Hospital has reexamined 138 patients with a history of primary exudative pleurisy and has come to the conclusion that pneumothorax treatment is indicated when pulmonary infiltration is demonstrable on the pleurisy side or when the sputum contains tubercle bacilli and there is no demonstrable pulmonary infiltration in the side opposite the pleurisy. His routine treatment of primary exudative pleurisy is replacement of the fluid by air under atmospheric pressure, but only on one occasion.

The Salaries of Junior Hospital Doctors

In the past the competition for hospital internships, including appointments for several years, has been so keen that hospital boards have secured these services cheaply. For that matter competition is still pretty keen in the larger hospitals. But now a coordinated movement for better pay of juniors is being sponsored by the Norwegian Medical Association, which marks with an asterisk those advertisements of hospital appointments to which an inadequate salary is attached. This asterisk tells a prospective applicant to stipulate that he will not accept the appointment unless the Norwegian Medical Association approves of it. The *Journal of the Norwegian Medical Association* frankly charges several hospital boards with sabotage in connection with the claims of juniors to a revision of their salaries.

The Prognosis for Acute Nephritis

Dr. Ruth Ramberg of the Drammen City Hospital has undertaken a follow-up study of 175 patients treated for acute nephritis in this hospital in the period 1935-1944. Ten of these patients died while still in hospital and 4 after discharge. As many as 148 subsequently underwent ophthalmoscopy and measurement of the blood pressure, the sedimentation rate and urea clearance. The urine was also carefully examined. It was found that 108 could be considered cured, while 29 were not cured and 11 had suffered from relapse. It would seem that a considerable degree of proteinuria and definite edema are signs of bad omen. As high a proportion as 89 per cent in the "cured" group had undergone some acute infectious disease before the onset of signs of nephritis.

Congress on Brucellosis

The first Inter-American Brucellosis Congress in Mexico City from Oct. 28 to Nov. 2, 1946 was attended by delegates from most of the American countries. Over sixty papers were presented, covering various subjects:

EPIDEMIOLOGY

A considerable diffusion of brucellosis throughout the continent has occurred during the last few years. Evans, Jordan, Schmidt and Campbell showed that the increment of human cases was due not only to better means of diagnosis but to a real increase in the occurrence of the infection. Huddleson pointed out that after the attempt to suppress bovine brucellosis in the United States through radical measures, the infection is again as extensive as before and consequently the chances of transmission to man as high as ever. Furthermore, to the bovine strains which produced the majority of human cases in the past must be added cases due to the suis and melitensis types of infection. Pasteurization of milk obviously has not been sufficient to stop brucellosis; therefore other sources of infection must be taken into account. Direct contact with infected animals is a source of infection. Man to man infection has to be taken into consideration. Evans advanced the opinion that the great adaptability of Brucella may bring about at any moment "canine strains" and even "human strains." If this occurs the epidemiology of the disease may become greatly complicated. Argentine delegates (Molinelli and his associates, Criscuolo) presented reports from which it appears that the distribution of the three types of Brucella is conditioned by that of cattle, goats and hogs. In the province of Cordoba, one of the important foci of the infection, Brucella melitensis has been found to be prevalent. It appears from the work of Purriel and his collaborators that in Uruguay infection by Brucella abortus is predominant. A similar situation has been found in Brazil by Pacheco. The cases reported from Colombia are mainly due to Brucella melitensis, which was also the cause of the infection in the few cases reported from Central America (Menendez). In Puerto Rico and Cuba (Pomales-Lebron and Martinez de la Cruz) the prevalent variety is Brucella abortus. Ortiz-Meriotte, Angelini and other Mexican epidemiologists presented brucellosis as growing into a serious public health problem. The northern and central states show considerable incidence. Surveys by means of skin tests have shown percentages ranging from 25 to 45 reacting to the antigen. According to Castañeda Brucella melitensis has been found prevalent. The disease in the city of Mexico was related to the consumption of goat's cheese, butter and cream, which are prepared from unpasteurized milk. Epidemics of brucellosis have been reported in the state of Jalisco, where raw cow's milk is consumed. It seems that the caprine organism has been adapted to bovines.

BACTERIOLOGY

Molinelli, Ithurrat and their collaborators described methods of isolation and identification of the infecting agent. They obtain better percentages of isolation by collecting the blood in citrate and then seeding in liver infusion agar with or without carbon dioxide. They recommend shaking the flasks daily. Brucella may be detected from the fourth day on. Huddleson presented studies on a new medium for isolating and growing Brucella. The organisms grow better if the medium is shaken in order to have a constant interchange of fluid and gases. It has been found that Brucella abortus for isolation requires a reduced oxygen tension (5 per cent) as well as an increased carbon dioxide (10 per cent) tension.

LABORATORY DIAGNOSIS

Various speakers indicated that the agglutination test continues to be the most useful procedure in the diagnosis of active brucellosis. The blood culture is not yet a method which can be employed outside well equipped laboratories, and the allergic and opsonic tests are of difficult interpretation. The rapid agglutination test developed by Huddleson continues to be in the favor of most physicians, while the tube test remains restricted to well equipped laboratories. The bedside test recommended by Castañeda is a screen test which may be useful in zones where no laboratory facilities exist.

The general opinion was that we lack a reliable method of detecting chronic brucellosis. Some authors rely on the skin test with the reservation that it should be restricted to cases in which clinical evidence points to a possible Brucella cause. D'Antoni stated that a "therapeutic test" which he developed has been useful for patients with intestinal brucellosis. The test consists in the administration of M. B. P. vaccine at intervals of five days, with increasing doses. Possible reactions include severe malaise, fever and flaring up of the intestinal manifestations. Schmidt, Harris and Ithurrat suggested that complement fixation might solve the problem of diagnosis.

ALLERGY

Leon, Criscuolo, Molinelli and his associates and Maldonado-Allende recommended the skin test for detecting skin allergy. Some delegates warned against the possibility of misleading reactions in persons with past contact with Brucella material. Leon stated that it is possible to detect the type of the infecting Brucella by using simultaneously melitensis and abortus antigens. Clinical papers by Maldonado-Allende, Morones and Guerroro-Ibarra described the appearance of skin manifestations related to Brucella allergy. Major allergic disturbances such as nasal and bronchial asthma and migraine were reported by Villafañe-Lastra, which were readily relieved by specific vaccine therapy.

CLINICAL PICTURE

A majority of the delegates were inclined to consider brucellosis a disease with an initial acute phase followed by a chronic phase. Variants of this general type are the acute disease not followed by the chronic stage and the chronic disease of Evans's type. Goobar advanced the opinion that the infection remains in the organism for the remainder of the life of the individual. Therefore it must be considered as a chronic disease with acute or subacute episodes which may appear at the beginning or in later stages of the infection. Brucella melitensis, which prevails in Argentina and Mexico, takes a severe course and is followed by a large variety of complications. Villafañe-Lastra, Goobar, Maldonado-Allende and Molinelli reported that, besides the well known symptomatology of acute brucellosis, there is a high incidence of bone complications and spondylitis. Guerroro-Ibarra presented a study of 800 cases of melitensis infection in Mexico City with symptoms closely conforming to the typical picture described by Hughes in 1897. Certain manifestations such as painful localizations near the sacroiliac joint have been common in Mexico. Villafañe-Lastra, Goobar and Guerroro-Ibarra emphasized the high incidence of nervous manifestations in brucellosis, such as meningomyelitis, meningitis, neuritis, blindness through lesions of the optic nerves and paralysis of various regions due to neuritis or central lesions. Mental disturbances were considered to be quite frequent.

SPONDYLITIS

Villafañe-Lastra, Di Rienzo, Maldonado-Allende and others reported experience illustrating various types of vertebral lesions observed. In several cases the observation was completed by necropsy. Di Rienzo has followed his patients year after year, and the comparison of x-ray films taken at various stages of the disease give, among other findings, information concerning the early lesions, the manner in which Brucella destroys the vertebral body or the disks and the process of healing that is characteristic of brucellosis. Both Villafañe-Lastra and Di Rienzo emphasized the importance of the lesions of the intervertebral disks, which may become herniated and protrude either into the spinal canal or into the destroyed vertebral body.

RADIOLOGY

Di Rienzo recommended x-ray examination of all brucellosis patients regardless of actual symptomatology, since vertebral lesions may be detected at the earliest stages of the localization. Furthermore, the multiplicity of the bone lesions and the frequency of localizations in the lungs, circulatory system and joints require a systematic radiologic exploration. The exploration of the teeth was discussed by Martinez, who finds it necessary to perform careful x-ray examinations and remove all defective or infected teeth.

HEMATOLOGY

Sanchez-Yllades reported blood and bone marrow studies on 104 patients with acute brucellosis. He finds moderate anemia and normal white blood cell and lymphocyte counts and lower percentages of neutrophils. The bone marrow showed slight lymphocytosis and lower percentages of granulocytes. Gonzalez-Guzman studied 50 cases of acute and subacute brucellosis, finding a shift to the left of Arneth's index of lymphoid cells, decrease of lymphocytes with azurophilic granules and increase of the nucleolar richness, expressed by the Rn index corresponding to a greater youth of the lymphoid cells in the blood stream. Hematologic studies presented by Villafañe-Lastra indicate that there is relative or absolute increase in lymphocytes with decrease in polymorphonuclears. In a high percentage of the patients the total number of leukocytes has been lower than normal.

PATHOGENESIS

Castañeda discussed the pathogenesis of brucellosis, considering the intracellular growth of Brucella. He followed the organism through the stages of the acute experimental infection, finding it within macrophages, fibroblasts, endothelial and reticular cells, interstitial cells of the testis, alveolar cells and others. A cell to cell propagation of the infection was considered a possible explanation for the survival of the organism in spite of the high degree of immunity of the host. The constant discharge of antigenic material may be responsible for the general and local reactions observed in subacute and chronic brucellosis. The intracellular position of Brucella would prevent the action of antibodies and chemotherapeutic agents. This manner of understanding the pathogenesis would explain most of the symptoms and complications observed in brucellosis.

PATHOLOGY

Mazza reported that the main lesions found in men were in the spleen, where the lesions consist of hyperemia, hyperplasia and epithelioid hypertrophy of the splenocytes are so frequently seen that the author considers them characteristic of brucellosis. In the liver he finds fatty degeneration; the Kupffer cells are hypertrophic, and their phagocytic properties are increased. The kidney shows glomerulonephritis. Nyka, who works with Castañeda, found that guinea pigs inoculated intratesticularly developed panorchitis with an initial proliferating and a terminal suppurating stage. In mice inoculated intranasally, interstitial pneumonia developed, killing some of the animals in forty-eight hours. The spleen, liver, kidneys and brain showed inflammatory lesions of nodular type or foci of necrosis. Some of the pathologic aspects in experimental brucellosis were similar to those found in man by Mazza and himself. Nyka records 3 cases of fatal subacute brucellosis by Brucella melitensis, and all 3 showed considerable damage in the kidneys, spleen and liver. The main interest in Nyka's paper is the demonstration of the correlation of Brucella with the lesions and the constancy of the intracellular growth of the organism. However, in some necrotic spots Brucella was found extracellularly.

THERAPY

Several speakers have used successfully vaccine prepared with Brucella abortus in the treatment of subacute and chronic cases. Moss used detoxified vaccines, while other authors applied small doses of the bacterial suspensions with the main purpose of desensitizing the patients rather than increasing the immunity. Carrillo-Cardenas reported the results of eight years' experience in Castañeda's service at the Mexico General Hospital, using M. B. P. as a desensitizing agent. A group of 600 cases were reported cured by this method; in 30 cases the treatment was of little or no help, and there were 10 fatal cases having persistent bacteremia and severe complications. Information gathered from various physicians using M. B. P. in Mexico and in the United States indicates that desensitization relieves the patients.

D'Antoni reported satisfactory results in desensitizing patients suffering from intestinal brucellosis (a form of the chronic infection). He used M. B. P. (soluble antigen prepared from Brucella). Cases of amebiasis occurring in persons afflicted with chronic brucellosis were prompt and permanently cured by the combined treatment of amebiasis and brucellosis.

Considering the intracellular life of Brucella, Castañeda stated that in the subacute and chronic phases of the disease all one may expect at present is to reduce the hypersensitivity of the patients, modifying the course of the disease by lowering the intensity of the general and local reactions. In his experience most complications are prevented by systematic elimination of foci of secondary infection.

BLOOD THERAPY

Mena-Brito warned against the use of so-called immune transfusions, since Brucella may be found in the blood of apparently immune donors. He has observed shock in patients after immune blood transfusion or intravenous plasma therapy. However, Videla considers immune plasma useful in the treatment of his patients.

CONTROL OF BRUCELLOSIS

Epidemiologists from the most seriously affected zones of Mexico supplied information concerning plans for the organization of a campaign for the control of Brucellosis appropriate to each region, since general regulations have failed. Goobar and Oulton presented a plan for a large scale campaign in the province of Cordoba, Argentina. The plan is based in the organization of special boards for the direction of the campaign, vaccination with suitable vaccines and segregation of positive reactors. These recommendations would be enacted into law regulating the transportation of cattle, sanitary certification of breeders and other measures aiming at promoting the maintenance of healthy herds; tax exemption to encourage pasteurization plants, clinical examination of animals, and so on. Finally, the sale of unpasteurized dairy products is prohibited.

Most delegates agreed that a wide educational campaign, particularly among persons living in contact with goats and hogs, is highly necessary. It became apparent that we are far from a good plan for the control of brucellosis in animals.

Huddleson suggested that vaccination as a widespread measure should be held up until a suitable vaccine is developed that will immunize adult animals. Such a vaccine should be effective without causing blood changes that will confuse the diagnosis of the disease. He discussed experiments carried out in Michigan, where vaccination with one of the "mucoid" phases of Brucella suis appears to check the spread of the disease in susceptible animals in recently infected herds of cattle. Many reacting animals that are treated with the vaccine become negative to the agglutination test. The vaccine does not cause the development of a high serum agglutination titer. The noninfected animals become negative to the agglutination in from sixty to ninety days after treatment.

Correspondence

CANCER TREATMENT BY AUTOVACCINATION

To the Editor:—In the editorial comment on "Cancer Treatment from Russia" in the January 11 issue of The Journal you stated that according to a release (*U. S. S. R. Information Bull.* **6**:12 [Oct. 23] 1946) from the Russian embassy a method of autoinoculation of human cancer was used by Krasheninnikov with promising results and that this method was based on observations made by Besredka.

The Russian author undoubtedly referred to the work which I did with Besredka at the Pasteur Institute in Paris (Besredka, A., and Gross, L.: *Ann. Inst. Pasteur* **55**:402, 491, 1935; **57**: 343, 1936; **60**:5, 465, 1938; **62**:253, 1939). In these studies we observed that the intradermal implantation of an appropriate dose of tumor cell suspensions into susceptible animals results in the development of cutaneous tumors that may spontaneously regress. The spontaneous regression of such intradermal tumors is accompanied with the establishment of an active immunity directed specifically against the particular tumor which was used for the inoculation. Such spontaneous regression of the implanted tumors with the resulting immunity readily occurs in the case of certain tumors such as the Brown-Pierce epithelioma in rabbits, but this occurs with less frequency in the case of other neoplasms, such as certain sarcomas in mice and chickens.

In any event, only preventive immunization was possible. The question immediately arose in our minds, however, whether a similar immunity could not be produced in animals that already had tumors—that means whether a therapy of tumors could not be attempted by autovaccination. Accordingly, a series of experiments was performed for the purpose of determining an answer to this question. It can be stated briefly that all these experiments gave negative results and that in no case an animal that already was carrying a tumor could be immunized by means of the intradermal method against its own neoplasm.

Our experiments were not limited to animals; in a few cases we also inoculated patients that had tumors with their own neoplasms. The experiments on human beings were of course limited to persons who already had metastatic tumors so as not to endanger them by these studies (*Cancer Research* **4**:293, 1944). In these few instances in which we inoculated human beings with their own tumors it was found that the implants appeared within several weeks after the intradermal inoculation and that these implants then grew rapidly so that they had to be promptly removed. There was no evidence whatever of any spontaneous regression of either these implants or the primary neoplasms.

Similar experiments were also made by the French surgeon T. de Martel (*Bull. et mém Soc. nat. de chir.* **60**:1390, 1934), who transplanted carcinoma of the breast in 3 patients and carcinoma of the bowel in 1 patient under the skin of the abdomen and each into the patient in whom it had originated. A latent period of approximately five months was observed in all 4 instances; after that time had elapsed, however, the implants began to grow very rapidly so that they had to be destroyed by x-rays. No evidence of a spontaneous regression of either the implanted tumors or the primary neoplasms could be observed in these cases.

We have performed additional studies on animals along this line, and there appears little doubt, if any, that under the present conditions of experiments an autoinoculation of a tumor may only lead to the establishment of an artificial metastasis. For that reason the news on the autovaccination experiments of Krasheninnikov should be regarded with criticism. Experiments thus far performed appear to indicate that autoinoculation of untreated cancerous tissue in man, be it wrapped in a piece of omentum (as the Russian author suggests) or not, be it into or under the skin, is highly dangerous. The result can only be the artificial creation of a progressively growing metastatic tumor.

Ludwik Gross, M.D., New York.

USE OF AMPHETAMINE SULFATE IN MANAGEMENT OF OBESITY

To the Editor:—Dr. S. Charles Freed deserves a great deal of praise for his intelligent and practical approach to the treatment of obesity.

There has been considerable criticism relative to the use of amphetamine sulfate for this purpose because of unpleasant side reactions, toxic manifestations and the possibility of addiction. Also there are some who feel that it is useless with respect to controlling appetite.

I agree with Dr. Freed and wish to emphasize the value of amphetamine sulfate in managing obesity in children. Over a number of years I have experienced no serious untoward reactions or addiction in several hundred cases. In my original report (Experience with Benzedrine Sulfate in the Management of Obesity in Children, *J. Pediat.* **17**:490 [Oct.] 1940) no remarkable effects on basal metabolic rate, blood pressure and pulse rate were noted, and unpleasant reactions such as nervousness, insomnia and occasional abdominal pains can be controlled with barbiturates.

Recently Dr. Heinrich Necheles and I studied the effect and mechanisms of amphetamine sulfate on weight reduction (Studies on the Effect and Mechanism of Amphetamine Sulfate on Weight Reduction, *Am. J. M. Sc.* **205**:820 [June] 1943). We believe that the psychic effects of amphetamine plus depression of gastric hunger motility and of hunger can explain the ability to control appetite and food intake in the obese child.

There is no question that the psychogenic factor in obesity is of paramount importance. In the treatment of children in particular the problem of controlling appetite is extremely difficult. The will power is usually poor and adherence to a low caloric diet is difficult. In many hospitals and clinics psychiatric consultation is available and psychotherapy is practical at little or no expense to the patient. In private practice however the problem is different. Usually such treatment is not readily available or may be a financial burden on the family. Under such circumstances the family physician or pediatrician must practice his own psychotherapy to his best ability. Amphetamine sulfate is a valuable adjunct.

Ralph H. Kunstadter, M.D., Chicago.

PENICILLIN AS A BLOOD COAGULANT

To the Editor:—Supplementing my letter of January 24 regarding the effectiveness of penicillin as a blood coagulant, today I found in The Journal February 1, page 354, under Current Medical Literature, the review of an article published in the *Giornale di Medicina*, Palermo: "Fradà directs attention to the frequency of embolism of the large blood vessels occurring in the course of penicillin therapy in acute and subacute endocarditis. . . . The author believes that penicillin increases coagulability of the blood."

Mort D. Pelz, M.D., St. Louis.

CAUDAL ANESTHESIA

To the Editor:—My attention has been drawn to your editorial comment on caudal anesthesia in the January 25 issue of The Journal.

I recall the several favorable references on this form of obstetric relief that appeared in your columns shortly after Hingson and Edwards first announced their method. At that time I wrote a word of warning against the acceptance of the method as a safe procedure, calling attention to one maternal death in approximately every 1,600 cases, having occurred in 15,950 deliveries performed under this form of analgesia. Four of these deaths, one of which happened in their own hands, were included in the 10,000 case reports of Hingson and Edwards. In the same report they cited two fetal deaths attributed to the method. Also at that writing I mentioned two fetal disasters that occurred at our clinic at Indiana University.

During the past three years I have known of five additional maternal deaths, one of which occurred within the past year at one of the larger Chicago teaching centers. In this instance the administrator of the analgesia had had an experience of over 800 cases and therefore properly could have been considered an expert. Following this death the institution has discontinued the method.

With the resulting continued mortality I cannot refrain from once again raising a strong note against caudal anesthesia in obstetrics as a safe procedure.

The current editorial indicates the success of the method by referring to its low incidence of failure, 5.3 per cent. Although this percentage is comparable to that of other methods, it does not include the relatively high percentage of patients eliminated because of clinical and anatomic reasons.

While many of the advantages of caudal anesthesia can be highly stressed, emphasis should by no means be placed on its simplicity and safety.

C. O. McCormick, M.D., Indianapolis.

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

BOARDS OF MEDICAL EXAMINERS
BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Examinations of the boards of medical examiners and boards of examiners in the basic sciences were published in The Journal, Mar. 8, page 716.

NATIONAL BOARD OF MEDICAL EXAMINERS

National Board of Medical Examiners: *Parts I and II.* Various centers, March 17-19. *Part III.* Various centers, June. Durham, Oct. 21-23. Sec., Mr. Everett S. Elwood, 225 S. 15th St., Philadelphia 2.

EXAMINING BOARDS IN SPECIALTIES

American Board of Anesthesiology: *Oral.* Los Angeles, April 11-12. Sec., Dr. P. M. Wood, 745 Fifth Ave., New York.

American Board of Dermatology and Syphilology: *Oral.* New York City, April 25-27. Sec., Dr. George M. Lewis, 66 E. 66th St., New York 21.

American Board of Internal Medicine: *Written.* Chicago, March 17. *Oral.* Philadelphia, June 5-7. Final date for filing application is April 1. Asst. Sec., Dr. W. A. Werrell, 1 W. Main St., Madison 3, Wis.

American Board of Obstetrics and Gynecology: *Part II.* Pittsburgh. June 1-7. Sec., Dr. Paul Titus, 1015 Highland Bldg., Pittsburgh.

American Board of Otolaryngology: Chicago, Oct. 7-11. Sec., Dr. D. M. Lierle, University Hospitals, Iowa City, Ia.

American Board of Pathology: Philadelphia, June 3-4. Final date for filing application is April 15. Sec., Dr. Robert A. Moore, Euclid Ave. and Kings Highway, St. Louis 10.

American Board of Pediatrics: Effective May 1, application fee will be $125.

American Board of Radiology: Atlantic City, June 4-8. Final date for filing application is April 1. Sec., Dr. B. R. Kirklin, 102-110 Second Ave., S. W., Rochester.

American Board of Urology: Chicago, February. Final date for filing application is Nov. 1. Sec., Dr. G. J. Thomas, 1409 Willow St., Minneapolis 4.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Privileged Communications: Testimony of Consulting Physician.—This was an action to recover damages for personal injuries resulting from the alleged negligence of the defendant employer. After a verdict for the plaintiff, the defendant filed a motion for a new trial, which was heard by the U. S. district court, D., fifth division, Minnesota.

In arguing his motion, the defendant contended, among other things, that the trial court erred in rejecting certain testimony which he offered. It appeared that Dr. McHaffie, employed by the defendant, attended the plaintiff on his arrival at the hospital and during the period of his convalescence. Irrespective of the source of employment, said the court, the doctor attended the patient in a professional capacity, and the relation of physician and patient existed. The information obtained by Dr. McHaffie in that capacity was therefore privileged, if the patient desired to claim it, under section 9814(4), Mason's Minnesota Statutes 1927, which provides:

> A licensed physician or surgeon shall not, without the consent of his patient, be allowed to disclose any information or any opinion based thereon which he acquired in attending the patient in a professional capacity and which was necessary to enable him to act in that capacity. . . .

But Dr. McHaffie was called by the plaintiff as an adverse witness, said the district court, and the privilege as to him was thus waived so there was no question as to the admissibility of his testimony. Seven weeks after the accident, however, Dr. McHaffie and Dr. Dittrich called at plaintiff's home for an examination and consultation. The testimony of the latter was offered by the defendant and an objection thereto by the plaintiff sustained on the ground of the privilege. The defendant contended, on motion for a new trial, that the plaintiff waived his right to object to the testimony of Dr. Dittrich by waiving the privilege as to Dr. McHaffie.

The oral examination of Dr. Dittrich pertaining to the relationship of physician and patient revealed that Dr. Dittrich examined the plaintiff on Feb. 5, 1946 at the request of Dr. McHaffie for the purpose of advising about treatments for him; that the doctors discussed the matter and that Dr. Dittrich made some suggestions regarding the treatment and that he went there "just like you would go to any patient that you were called to take care of." Dr. McHaffie also called Dr. Haukom for consultation and to read x-ray films while the plaintiff was at the hospital, but his testimony was not offered at the trial. If these doctors were called for consultation and for advice in the treatment of the plaintiff, said the court, ordinarily they would not be permitted, over the objection of the patient, to divulge what they learned. The defendant argued, however, on the basis of a prior Minnesota case that an examination and treatment of a patient by two or more physicians or surgeons was an unitary affair and that, where the patient permits one of them, as his own witness, to testify as to the whole matter, privilege is waived. The district court noted, however, that the courts of many other jurisdictions have held that the privilege under the statute is not waived by permitting one of two or more attending physicians to testify on the theory that the privilege extends to the individual witness and not to the consultation or transaction in which the physician was engaged. Citing with approval a prior Idaho case the district court said that "the decided weight of authority is in favor of the view that a waiver of the privilege as to one physician does not waive the privilege as to any other physician. It is also very clear that our [Idaho] statute forbids and prohibits the examination of a physician without the consent of the patient, and this privilege extends to the individual witness and not to the consultation or transaction in which he was a physician. In other words, each individual physician is a witness within the meaning of this statute, rather than a number of physicians who may be present or participate in a consultation, being treated as one witness. . . ." On principle, said the district court, the basis of the rule is sound. A patient may attend a clinic or hospital to consult an individual physician. While there, other physicians, for the best of reasons, may be called into consultation. Possibly the one called is at the time the duly appointed physician of some person having interests adverse to that of the patient. The physician called for consultation should refuse either to serve or to violate the privilege resulting from the relation of physician and patient. After the examination has been made the privilege should be respected.

Accordingly, the court ruled that the plaintiff's privilege as to Dr. Dittrich had not been waived by allowing Dr. McHaffie to testify and that the motion for a new trial must be overruled.—*Tweith v. Duluth, M. & I. R. Ry. Co., 66 F. Supp. 427 (Minn., 1946).*

Medical Practice Acts: Chiropractic as Practice of Medicine.—The plaintiff, State Board of Medical Examiners of New Jersey, filed a complaint charging that the defendant practiced medicine in the state of New Jersey without first having obtained a license authorizing him so to do. The trial court, without a jury, held that the defendant did not practice medicine, from which judgment the plaintiff appealed to the supreme court of New Jersey.

The uncontradicted evidence showed that the defendant was licensed to practice chiropractic in Kentucky and Nevada but was not licensed to practice either medicine or chiropractic in New Jersey. He held himself out as a chiropractor and practiced accordingly, however. While engaged in such practice, the defendant was visited by two female investigators employed by the plaintiff board, each of whom complained of a "lame back," made arrangements with the defendant for a fixed period of treatments and paid him $15 on account. They also signed contracts which, among other things, emphasized that defendant did not, as a doctor, treat, operate or prescribe but, as a chiropractor, merely adjusted the spinal column. Under these contracts the defendant treated one witness eleven times and the other three times, during the course of which the defendant took x-rays of each witness, took neurocalometer readings of the neck and spine and gave each various chiropractic treatments.

The defendant contended that he did not practice medicine "in its true sense" within the meaning of the statutes but that what he did constituted the practice of chiropractic. The position taken by the defendant is without merit, said the court, for the defendant did not in fact practice chiropractic within the statutory definition of that term. The practice of chiropractic is defined as "the detecting and adjusting, by hand only, of vertebral subluxations." Clearly, the defendant's manner or method of treatment embraced extra instrumentalities. However desirable the use of such instruments may be, their use is not treatment by hand only. Moreover, continued the court, the statute provides that ". . . the practice of medicine . . . shall be deemed to include, inter alia, the practice of . . . chiropractic. . . . No argument to the contrary, however ingenious, can cloud the clear and explicit classifications into which the legislature placed the practice of chiropractic. The provisions which defendant allegedly violated are those which the legislature defined as constituting the practice of medicine and those which define a penalty for so practicing without a license. The reason for such statute is simply to make abundantly clear that the legislature intended to include the practice of chiropractic within the meaning of the practice of medicine as set forth in the statutes. Thus, the court concluded, whether, as claimed by defendant, one who practices chiropractic merely analyzes and adjusts the ailment, while one who practices medicine diagnoses and treats the ailment, the end result, apart from the play on words, is that each undertakes by his particular means or methods to relieve the patient from his ailment or disease. That is practicing medicine within the meaning of the statutes as charged.

Furthermore, the court continued, there is nothing in the proofs adduced and the law applicable thereto to support the defendant's claim that the inclusion of the practice of chiropractic within the meaning of the practice of medicine operated unreasonably to deny his asserted rights under the state and federal constitutions. In a prior Louisiana case which was affirmed by the Supreme Court of the United States it was held that "to practice chiropractic is to practice medicine" and that such holding did not violate the chiropractor's rights under the state constitution and under the federal constitution.

Accordingly, the court having determined that the trial judge erred as a matter of law in determining that the defendant had not illegally engaged in the practice of medicine, the judgment in favor of the defendant was reversed.—*State Board of Medical Examiners v. Grossman, 48 A. (2d) 700 (N. J., 1946).*

Medical Motion Pictures

NEW FILMS ADDED TO A. M. A. LIBRARY

The following medical motion pictures have been added to the American Medical Association library of films:

HYDROTHERAPY.

16 mm. Black and white. Sound.

Running time twenty-two minutes.

Film shows how to administer sedative baths (Nauheim and continuous flowing) and wet sheet packs; tonic showers, douches and sprays; special types of therapeutic baths; rehabilitation hydrotherapy in the Hubbard bath and rehabilitation pool, and the physiologic effects of hydrotherapy on the body.

RADIOTHERAPY: HIGH DOSAGE TREATMENT.

16 mm. Black and white. Sound.

Running time seventeen minutes.

Film explains the nature of x-rays, the varying degrees of penetration of low voltage and high voltage rays, and the effect of x-rays on human tissue and shows how the nurse technician prepares a patient and administers an x-ray treatment, and how radon seeds are sterilized and implanted in diseased tissue.

RECREATIONAL AND OCCUPATIONAL THERAPY.

16 mm. Black and white. Sound.

Running time thirteen minutes.

Film shows recreational and occupational activities fitted to the patient's condition; passive diversion during an immobile state following traumatic injury; limited physical activities carried on in bed; individualized occupational therapy as supervised by the nurse; group occupational work in hospital and community, and social recreation projects.

THERAPEUTIC USES OF HEAT AND COLD. PART I: ADMINISTERING HOT APPLICATIONS.

16 mm. Black and white. Sound.

Running time twenty-one minutes.

Film explains the nature of heat and shows how it is transferred by conduction, conversion and convection; explains body reactions to heat and the use of these reactions in the alleviation of pain; shows how to apply hot water bottles, electric pads, chemical pads and paraffin bath; how to use hot soak, compresses, infra-red lamp and short wave diathermy, and precautions which must be taken when applying heat.

THERAPEUTIC USES OF HEAT AND COLD. PART II. ADMINISTERING COLD APPLICATIONS.

16 mm. Black and white. Sound.

Running time twenty-two minutes.

Film shows the body's responses to cold stimuli and how these responses are used to alleviate pain; how to administer contrast baths and ice bags; how to apply ice packs as anesthesia, and how to use refrigerating blankets and cold chamber.

THE DIODE.

16 mm. Black and white. Sound.

Running time seventeen minutes.

Film explains the principles of electron flow across a gap; basic features of the diode tube; control of electron flow in the tube; photoelectric cells; x-ray tubes, and the diode as a rectifier.

THE TRIODE.

16 mm. Black and white. Sound.

Running time fourteen minutes.

Film reviews the diode principle; explains the electric field in a diode; electric field in a triode; a triode amplifier circuit; amplification of direct current voltage changes; amplification of alternating voltages; distortion; amplification of audio frequency signals, and reviews the triode principle.

These films, produced in 1945 by the Division of Visual Aids, U. S. Office of Education, are available on a loan basis from the American Medical Association to medical societies, medical schools, hospitals, and other scientific groups. The transportation charges (both ways) will be paid by the borrower. Requests should be submitted as far in advance as possible to the Secretary, Committee on Medical Motion Pictures, American Medical Association, 535 North Dearborn Street, Chicago 10.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1937 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied with stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Disparity in Appearance of True Hansen's Bacilli and Cultured "Leprosy Bacilli" When Stained for Fat. K. L. Burdon.—p. 679.
*Comparative Action of Extract of Brain Tissue and Penicillin on Staphylococcus Aureus Infections. L. G. Nutini and Eva Maria Lynch. —p. 681.

Bactericidal Detergent for Eating Utensils.—Guiteras and Shapiro believe that an ideal dishwashing compound would be one that combines the detergent properties of the anion active agents with the bactericidal properties of the cation active. Since these two types of surface active agents are incompatible it is impossible to combine them, because they would neutralize each other. The purpose of this investigation was to develop a detergent suitable for washing and sanitizing eating utensils. It was found that when cation active agents are used as bactericides in detergent compositions it is essential that the detergent be emulsifying but not saponifying. If the alkalinity of the detergent is sufficiently high to saponify fat, the resulting soap will inactivate the cation active agent and render the solution completely ineffective germicidally.

Action of Brain Tissue Extract and Penicillin on Staphylococcic Infections.—Nutini and Lynch say that for a number of years their laboratories have investigated the effects on bacterial growth of certain substances obtained from plant and animal sources. Extracts of beef spleen, heart, kidney and brain were effective against Staphylococcus aureus infections. The mortality in experimental animals receiving S. aureus and the brain extract subcutaneously was 0.9 per cent in the prophylactic series of 223 animals and 3 per cent in the therapeutic series of 116 animals, mortality in the control series being respectively 75 and 87 per cent. The present paper is a report of the comparative value of brain extract and penicillin as therapeutic and prophylactic agents against S. aureus in vivo. From the evidence presented it is apparent that there is in brain tissue a factor that functions effectively against Staphylococcus aureus in vivo. Whether the extract is used as a prophylactic or therapeutic measure, it is superior to penicillin in the dosages used for Staphylococcus aureus infections in these experiments.

Effects of Demerol in Obstetrics. W. M. Mallia.—p. 2753.
*Surgical Treatment of Dysmenorrhea. C. J. Duncan.—p. 2757.

Surgical Treatment of Dysmenorrhea.—According to Duncan dysmenorrhea is divided into two main groups: the essential, unassociated with demonstrable pelvic disorder and the secondary, in which some organic reason for the pain can be found. Section of the superior hypogastric plexus has been employed in recent years for the essential cases with dramatic results. Whether the excision of the presacral nerve accomplishes its effect by interruption of the true sensory pathways or because of changes in the vascularity of the fundus is debatable. When limited to cases of true uterine colic or so-called miniature labor, adequate presacral resection gives most comforting results. Secondary dysmenorrhea in the younger group may be treated conservatively with a high expectation of secondary surgery. Secondary dysmenorrhea in the older group should be treated by total hysterectomy and bilateral salpingo-oophorectomy.

Control of Heat in Industry. W. Machle.—p. 350.
Suggested Plan for Preventive Medical Program in Federal Employees' Health Service.—p. 360.

Ragweed Dermatitis.—According to Slater and his associates the rash of ragweed dermatitis is usually distributed on the exposed surfaces of the body such as the face, neck, forearms, hands, legs and feet but may, like other forms of dermatitis venenata, involve the whole body. An important factor in the diagnosis is the seasonal incidence and recurrence. Symptoms usually appear in August and end with the frost, corresponding with the period of pollination of ragweed; however, the eruption may appear as early as May, when the ragweed plant begins to grow, and may continue well up to November, as the ragweed plant maintains its vitality up to that time. The best advice to give a patient who is afflicted with ragweed dermatitis is to go to a place where ragweed does not grow. If this is not possible, the treatment of choice is by oral desensitization, the ragweed oleoresin being used in corn oil.

Fibromyositis and Referred Pain.—Slobe asserts that ailments classed under the broad grouping of "fibromyositis" are among the commonest diseases of adults. They are neither confined nor peculiar to industry. Their industrial significance arises from the frequency of involvement among the age groups employed in industry, the frequency of actual or alleged asso ciation with strains, sprains, contusions, continued exertion and minor repetitive motions, the vast number of lost workdays and the huge amount of impaired efficiency caused by these ailments. The author defines fibromyositis as a localized (occasionally diffuse) area of infiltration. The causation is not known. Referred pain and tenderness are frequent manifestations and are likely to cause errors in diagnosis. Characteristics of referred pain from the four most frequent sites of origin are described, namely the dorsolumbar region, the lower part of the back, the shoulder girdle and upper dorsal region and the cervical region. Special emphasis is placed, on the diagnostic and therapeutic value of injections of procaine hydrochloride.

*Ascaris in Common Bile Duct: Report of 10 Cases. F. Guzman and P. Morales.—p. 299.

Ascaris of Common Bile Duct.—Guzman and Morales report 10 cases in which Ascaris was found in the common bile duct during operation. The history and symptoms were characteristic of a gallbladder disease. Since gallbladder disease was coexistent with the presence of Ascaris, the authors advance the hypothesis that a preexisting gallbladder disease attracts the parasite into the common bile duct or at least makes it possible for the wandering worms to penetrate into the biliary system by causing a dysfunction in the sphincter of Oddi which normally would impede such an entrance. In the presence of a gallbladder disease, the removal of the parasites alone will not cure the disease; the gallbladder may also have to be removed.

Potassium and Sodium Metaphosphates as Sources of Phosphorus for Animals. H. F. Fraser, E. R. Smith and W. C. White.—p. 1810.

Calcifications in Spleen in Histoplasmin and Tuberculin Reactors.—High says that, although it is recognized that calcifications of the spleen can be produced by phleboliths, parasitic infections, abscesses, arteriosclerotic plaques, perisplenitis, infarcts, hemorrhage and many other conditions, tuberculosis in the opinion of most authors, is by far the most frequent cause of such calcifications. Twenty instances of splenic calcification were observed as incidental findings in a survey conducted in Kansas City, Mo. Tuberculosis did not seem the most frequent cause of such calcifications. The frequency with which splenic calcifications were noted in histoplasmin reactors suggests that the agent producing the sensitivity to histoplasmin is frequently responsible.

Infection with Bacillus Pyocyaneus (Pseudomonas Aeruginosa): Review of Literature and Case Report. E. H. Robitzek and G. Prausnitz.—p. 245.

False Acid Fast Bacilli.—Berczeller and Frank report observations from which they conclude that acid fast bacilli found in specimens originating from sites treated with fatty substances should be looked on critically. Acid fast bacilli found under these circumstances may only be fat coated gram positive or gram negative saprophytes. Before conclusive diagnosis is attempted by direct examination as to the presence of tubercle bacilli, fat (ointment) treatment should be discontinued for at least seven days. When a search for tubercle bacilli is made during this interval, the smears must be treated with fat solvents before staining.

Interpretation of "Doubtful" Congo Red Test.—Selikoff maintains that Bennhold's congo red test is of great value in the diagnosis of amyloidosis despite several limitations. He shows that the criticism of the "false positive" test is misdirected. The fault lies not with the test but with its interpretation. It has been customary to regard tests showing over 40 per cent absorption as positive. There is evidence that 40 to 89 per cent absorption is not at all diagnostic of amyloidosis. Most patients who show this result have no amyloid. Less than 90 per cent absorption in the congo red test should be considered as a negative result with the realization that, in a few cases showing this, amyloid will be present. Other means of diagnosis are necessary for these cases.

Revision Thoracoplasty.—Hochberg and his associates are concerned with 89 revision thoracoplasties, patients failing to have a conversion of the sputum within a reasonable period after the initial surgical procedure was completed and who were later subjected to revision of the original operation to enhance the collapse of the lung. The causes of failure in the original operation are operation over a pneumothorax, greatly thickened parietal pleura, anterior position of cavity and paravertebral thoracoplasty, pulmonary fibrosis, inappropriate surgery and giant and/or parahilar cavities. Approximately two thirds of the patients with the supposedly favorable upper-outer segment cavities failed to convert to negative. Twenty-four of the 89 patients died. The chance of success of a revision thoracoplasty is approximately 1 in 4.

Socialized Medicine. W. B. Rawls.—p. 448.

Cholecystography.—This study by Frank comprises a total of 600 cholecystographic examinations. Of these, 150 were done with Priodax, 150 with Dikol, and 300 with tetraiodophenolphthalein. It seemed only fair to contrast the methods used in this proportion, as there is no essential difference between Priodax and Dikol, which are trade names for beta-(4-hydroxy-3,5 diiodophenyl) alpha-phenylpropionic acid. This substance is preferable to tetraiodophenolphthalein because disagreeable side reactions are absent. Reference is made to the surgical findings in 83 cases used as a control of the preoperative diagnoses. The necessity of repeated oral examinations is stressed when the gallbladder does not fill or fills insufficiently. The diagnostic value of the nonemptying or too slowly emptying gallbladder is doubted in cases in which no other evidence of pathologic change can be demonstrated.

Effect of d-Tubocurarine Chloride on Sensation in Man. J. H. Kellgren and A. J. McGowan.—p. 898.

Diet and Canine Hysteria.—Mellanby says that canine hysteria, sometimes called running fits or fright disease, is a nervous condition in dogs that has been observed in Britain and the United States for the last twenty years. This condition can be produced experimentally in growing dogs by including in their diet flour that has been bleached with nitrogen chloride, the agene process. The same flour when untreated did not produce the nervous malady. Dogs recovered and the typical hysteria and fits stopped when the agenized flour was removed from the diet and replaced by unimproved flour.

2-Thiouracil in Treatment of Congestive Heart Failure.—Sharpey-Schafer tried to diminish thyroid activity of patients with congestive heart failure by administering 2-thiouracil. Patients with severe congestive heart failure showing no response to bed rest, digitalis and mercurial diuretics were given 2-thiouracil in doses of 1 or 2 Gm. a day over long periods. Life may be prolonged both in the low cardiac output cases (valvular and hypertensive heart disease) and in the high cardiac output cases (heart failure with emphysema). In the low cardiac output group the arteriovenous oxygen difference may decrease as well as the resting oxygen consumption. The work of the heart may be unchanged, but output is maintained at a lower venous pressure, and in relation to oxygen consumption cardiac output is relatively increased. Patients with high cardiac output heart failure with emphysema may improve sufficiently to leave the hospital in spite of permanent reduction of arterial oxygen saturation.

Venous Intravasation Following Intrauterine Injection of Iodized Oil.—Since intrauterine injection of radiopaque oils, such as iodized poppyseed oil, is now a common method of investigation of uterine abnormalities, especially of tubal patency in cases of subfertility, Bloomfield puts on record 6 cases of venous intravasation following this operation. Conditions predisposing to this accident include (1) injection of iodized oil within a period of less than eight days after the termination of menstruation, (2) injection immediately after dilatation of the cervix, (3) injection after curettage, before a proper interval has elapsed to allow of regeneration of the mucosa, (4) injection just prior to the onset of menstruation, when the congested and edematous mucosa readily allows of traumatization, and (5) injection with excessive force. In the first of the reported cases the contraindication listed under point 1 had been disregarded, owing to a misunderstanding. In the second case disregard of contraindication 4 or perhaps also 5 may have been responsible. Three other cases occurred within about two weeks. Since all the aforementioned conditions of safety were fullfilled, it is assumed that a new and rather rough surfaced rubber covering to the oil bearing cannula may have traumatized the cervix and permitted the ingress of iodized oil to the pelvic veins. Although as a rule this complication has few if any consequences, it may have serious and even fatal results.

Observations on Fibrinolysis.—Macfarlane and Biggs cite observations which suggest that fibrinolysis occurs in association with a variety of disturbances in which the common factor is obscure. The phenomenon is almost certainly due to the proteolytic digestion of fibrin resulting from activation of plasmin, a component of the enzyme system existing in normal blood. They state that fibrinolysis occurs not only after surgical operations but immediately before them in about 50 per cent of cases. The drugs used for premedication may be responsible for some cases of preoperative fibrinolytic activity. Fear of impending operation appears to cause a further proportion of positive results. Traumatic shock does not seem to be a major factor in determining fibrinolysis. The activation of the proteolytic system of normal blood, almost certainly responsible for the phenomenon of fibrinolysis, may be a part of the "alarm reaction" of Selye.

Amphetamine in Pulmonary Tuberculosis.—Houghton and Corrigan say that, contrary to popular belief, euphoria or spes phthisica is not often encountered during the active phases of pulmonary tuberculosis. The prevailing mood is commonly one of depression and overanxiety. They resorted to medication with amphetamine sulfate (benzedrine) and say that the drug appears to have value, particularly during the difficult phases of thoracic surgery and for the restoration of confidence in the depressed or overanxious patient.

Fatal Use of Dangerous Universal Donor.—A patient with group A blood died after transfusion with group O blood which contained exceptionally high alpha agglutinins. Agglutination of the recipient's corpuscles was followed by hemoglobinuria, uremia and death. Such incompatibility is not revealed by the standard cross matching tests (donor's cell against recipient's serum) and was brought to light only by subsequent titering of the donor's serum. Morgan and Lumb present the clinical, postmortem, histologic and serologic aspects of this case.

*Effect of Cerebrospinal Fluid on Interaction Between Rh Agglutinins and Agglutinogens. Rachel Jakobowicz and Lucy M. Bryce.—p. 740.

Interaction of Cerebrospinal Fluid and Rh Agglutinins.—Jakobowicz and Bryce point out that specimens of human serum containing strong anti-Rh agglutinins did not agglutinate group O Rh$_1$ cells when chemically normal cerebrospinal fluid was used (instead of saline solution) as the diluent for the serum dilutions and the red cell suspensions. The inhibition occurred irrespective of whether the cerebrospinal fluid was obtained from Rh-positive or Rh-negative persons. The inhibition of Rh agglutination by cerebrospinal fluid can be overcome by the addition of human serum or human albumin. Artificially prepared fluids containing the main known chemical components of cerebrospinal fluid do not mask Rh agglutination, nor does the chemically similar allantoic fluid of the chick embryo, but cerebrospinal fluid from 1 rhesus monkey and 1 rabbit had a similar effect on human Rh agglutination, as did 15 samples of human cerebrospinal fluid. The inhibiting effect of the cerebrospinal fluid may be related to the blocking phenomenon.

Aspects of Wrist Injuries in Elderly Patients.—Griffiths says that it is still inadequately realized that, apart from quite trivial injuries, the most frequent result of injury in the region of the wrist is a fracture. The majority of these fractures are undisplaced, or insufficiently displaced to produce visible deformity. They are therefore easily overlooked, and the possibly disastrous effects of their neglect will continue until every practitioner is aware that a genuine "sprained wrist" is a rare occurrence. The facile diagnosis of "sprain" has meant failure to recognize many fractured carpal scaphoids in young adults, and in older people the so-called sprain is all too often an impacted fracture of the lower end of the radius. If a wrist injury is severe enough to make the patient seek medical advice, it is severe enough to require an x-ray examination and, to be adequate, the films must include anteroposterior, lateral and oblique views. The author discusses Colles's fracture, fractures of the radial and ulnar styloid process and carpal injuries in elderly patients.

Lesions of Nervous System in Carbon Monoxide Poisoning.—According to Lhermitte and Ajuriaguerra the changes in the brain in carbon monoxide poisoning differ widely, depending on the time elapsed between the exposure and necropsy. Hemorrhages, necrobiosis, necrosis and edema characterize the anatomic picture in cases in which death occurred rapidly. These changes may involve primarily the lenticular nuclei but also the subcortical white matter, the hippocampus, the substantia nigra and the cerebellum. Changes in the vascular network with infiltration of the walls by neutral lipids and by a peculiar substance containing ferric salts, calcium and lipids may be observed in cases in which the poisoning continues for a prolonged period or in which death is delayed. A diffuse demyelinization of the entire white matter of the brain similar to Schilder's diffuse cerebral sclerosis may be observed in cases in which death occurs after a long period of remission. It is suggested that in carbon monoxide poisoning a toxic factor in addition to the anoxic factor affects the neuroglia and the vascular network, with specific involvement of the basilar region and the white fibers of the centrum ovale.

Urobilinogen Tolerance Test as Functional Liver Test. T. K. With. —p. 588.

Pancreatic Lithiasis.—Dalgaard reports 1 case of pancreatic lithiasis in a woman aged 76. Necropsy revealed a highly atrophic and lipomatous pancreas, particularly in the head. The pancreatic duct was dilated and contained several pea-sized stones. A gram-positive mycelium with spurs, obviously an actinomycete, was demonstrated in the stones on microscopic examination. Gram-positive cocci and a few coarse gram-positive bacilli were observed. The mycetes in combination with these bacteria are to be considered as the cause of the lithiasis. Fifty-eight cases (0.43 per cent) of pancreatic lithiasis were observed in a study of 13,350 necropsies which were performed at a hospital in Stockholm during the period 1926 to 1943. The incidence was considerably higher (1.56 per cent) during the period 1940 to 1943, when special attention was paid to the pathology of the pancreas.

Hygiea

Is Benign Lymphogranulomatosis Fungous Disease? E. Törnell. —p. 2149.

Frequency of Rheumatic Fever.—Harving states that the increased frequency of grave and moderately grave cases of rheumatic fever observed in the Odense District and City Hospital during the last three years is reflected in a general increase in the Danish population. The 225 cases were evenly apportioned between men and women. Heart disease was diagnosed in 109 (48 per cent) of the cases; men were more often and more gravely affected than women. On the whole the increased frequency does not seem attributable to conditions due to the war. Increased cyclonal character of the climate is suggested as contributing to the rise in frequency of this disease.

Book Notices

Diabetic Care in Pictures: Simplified Statements with Illustrations Prepared for the Use of the Patient. By Helen Rosenthal, B.S., Associate Dietitian in the Food Clinic, The Boston Dispensary, Boston, Frances Stern, Chief of the Food Clinic, The Boston Dispensary, and Joseph Rosenthal, M.D., Chief of Diabetic Clinic, Assistant Medical Director, Medical Supervisor of the Domiciliary Medical Service, The Boston Dispensary. Boards. Price, $2. Pp. 150, with 137 illustrations. J. B. Lippincott Company, 227-231 S. 6th St., Philadelphia 5; Aldine House, 10-13 Bedford St., London, W. C. 2; 2083 Guy St., Montreal, 1946.

This little volume, designed for diabetic patients, is profusely illustrated and presents an appealing approach to the problem of diabetes and its management. The text is short and to the point, thus not confusing the average patient. It presents all that a person with diabetes needs to know. The illustrations are good. A diabetic patient who sees these is encouraged from the start in the knowledge of how much he really can eat. Such an encouragement presents diabetes to the patient as a simple dietary problem. Pictures with a light text tell more than just text alone. The illustrations "Carbohydrate Exchange," "Protein Exchange" and "Fat Exchange" are excellent as far as they go, but much teaching will be needed to show an average diabetic patient how to use them for the simple reason that they present just one item, namely either the carbohydrate, the protein or the fat content alone. They do not tell the patient what else (carbohydrate, protein, fat, calories) that particular portion contains. As exchanges they are excellent but since they do not present the other food constituents, the patient will have to spend much time in hunting up the rest of the information which is essential. A complete analysis of carbohydrate, protein, fat and calories at the bottom of each square would have simplified this point. The illustrations on the use of the syringe are good and should be easy to grasp. However, here again we run into an anachronism. Why burden a patient with antiquated procedures of a tray set up for an insulin outfit when such simple and practical adjuncts as the B & D insulin outfit is available? This covers only one tenth of the space as does the tray, eliminates boiling the syringe, saves time. Progress has made the "horse and buggy" obsolete and we should keep up with it. The same applies to the urine tests, another tray with paraphernalia, the use of the spoon, the messiness of the whole procedure, when all that is needed is a small bottle of tablets and a small test tube such as the "Clinitest," with no boiling, no messing around and a prompt reaction. We must learn to conserve the patient's time as well as our own. On these two points one certainly could improve much. The color plates for the sugar, diacetic acid and acetone and the various kinds of insulin are good. Also the illustrations for the care of the feet. All in all it is a spendid little book, a good addition to the lay literature on diabetes.

Operative Gynecology. By Richard W. Te Linde, M.D., Professor of Gynecology, Johns Hopkins University, Baltimore. Fabrikoid. Price, $18 Pp. 751, with 324 illustrations. J. B. Lippincott Company, 227 S. Sixth St. Philadelphia 5, 1946.

"The author has attempted to fill this void [field of gynecologic surgery] with the present volume." He continues with the idea of bringing operative gynecology up to date in a single volume and then adds "this volume should be of value to those who, by self instruction, must acquire a certain degree of operative skill." He invites general surgeons to use the book.

The book contains many drawings. Like all first editions certain errors are present. For instance, there is one chapter entitled "Retrodisplacement of the Uterus" and yet in the index there is no reference to retrodisplacement or retroversion of the uterus. Prolapse is treated in a separate chapter. There is a limited number of colored reproductions. No doubt the author is most disappointed in their poor reproduction.

A good amount of space is set aside for proper diagnosis, preoperative care, armamentarium and anesthesia. The preoperative care and complications, armamentarium and anesthesia fill thirty-seven pages, while postoperative care and complications are disposed of in thirty-two pages. He uses only a page and a half for the treatment of postoperative peritonitis. By contrast, under the heading of "Gonorrhea and Its Complications" two full pages are given for the description of laboratory methods, three pages for treatment of the lower genital tract gonococcic infection, and then general discussion before approaching the subject of surgery for residual gonococcic disease. He described many operations for residual damage to the tubes and ovaries.

Discussion of the indications for surgery and the type of operation which one should perform is not direct or positive. The discussion of estrogen therapy for the menopause is limited almost exclusively to pellet implantation without comparison or adequate reference to other routes and types of therapy. As one reads the book the impression develops that it is more of a gynecologic textbook, with major emphasis on surgery rather than a gynecologic surgical volume. It gives the impression in some portions that the author is removed from obstetric problems and hence the intimate relationship of obstetrics and gynecology. He emphasizes the virtue of the use of the finger in the completion of abortion. Yet most gynecologists condemn this procedure.

The medical profession should expect a superior gynecologic volume because of the author's stature in the field of gynecology, his institutional connection and appointment, his scientific and clinical ability and his rich clinical experience. Probably the shortcomings have been the product of the stress and strain of the past few years. The next edition, and there is reason to believe there should be one in the near future, will undoubtedly come up to the level which we expect of Te Linde's efforts.

The many illustrations with the several operative steps are valuable and easily followed, so much so that they serve their purpose very well. Obviously the better portions (there are several) deserve full credit and strong recommendation. In spite of these criticisms this book on operative gynecology represents a major contribution in this special field. Special comments should be offered about the illustrations, for they were done by well known medical artists. The publishers (except for colored reproductions) have maintained their usual standard. Te Linde has presented his views concisely, easily and clearly. This book will undoubtedly be used generally and referred to frequently by a large number of the profession.

Jewish Luminaries in Medical History. By Harry Friedenwald, M.D. And a Catalogue of Works Bearing on the Subject of the Jews and Medicine from the Private Library of Harry Friedenwald. Cloth. Price, $3. Pp. 199, with 3 illustrations. Johns Hopkins Press, Homewood, Baltimore 18, 1946.

This deals with the most important contributions of Jewish medical men to medical science. The first part of the book contains a delightful essay of twenty-four pages on Jewish luminaries in medicine. The rest of the volume is devoted to a catalogue of books, pamphlets and manuscripts written by Jewish physicians or about Jewish physicians through the ages. The catalogue is limited to the collection in the private library of the author but it is quite complete, as Dr. Friedenwald happens to possess the largest collection of works on Jews in medicine. Although the catalogue of Steinschneider published at the end of the nineteenth century contains a greater number of references, Dr. Friedenwald's volume has the advantage of bringing the material up to date. Furthermore, the interesting comments and explanatory notes that accompany many of the listings make Dr. Friedenwald's catalogue much more than a mere listing of books and manuscripts. This little volume adds a great deal of information to our knowledge of the Jewish contributions to the progress of medical science. It can be read with interest and profit not only by the student of Jewish medical history but by any one interested in general medical history. Dr. Friedenwald has made a life study of the subject, and his work is authoritative.

Ocular Prosthesis. By J. H. Prince, F.B O A., F.S M.C., F.I.O. Cloth. Price, $4. Pp 134, with 76 illustrations. William Wood and Company, Mt. Royal & Guilford Aves., Baltimore 2, 1946.

The author, a sight testing optician in Great Britain, corresponding to an optometrist in this country, presents an interesting little book on the artificial eye. When he sticks to the subject of making and fitting artificial eyes his words are perhaps authoritative. Unfortunately, like so many other nonmedical practitioners, when he enters the realms of anatomy, physiology, diagnosis and treatment many of his statements are misleading. He seems unable to resist mentioning, lightly to be sure, clinical syndromes, using as one of his authorities Haskel

J. Kritzer, whose system of "Iridiagnosis" is without scientific standing. The treatment Prince advocates for gonorrheal conjunctivitis, who states that "it can be minimized by the use of an undine and one in five thousand solution of perchloride" is criminal in the light of present knowledge. He names papillitis as one of the diseases calling for enucleation, and his statement that "scars [of the conjunctiva] are healed with silver nitrate pencil" is highly improper. These and other inaccurate remarks will lead astray readers whose medical knowledge is as garbled as his own. Ophthalmologists will have little use for this book.

The Second Forty Years. By Edward J. Stieglitz, M.S., M.D., F.A.C.P. Foreword by Anton J. Carlson, A.M., Ph.D., M.D. Cloth. Price, $2.95. Pp. 317, with illustrations by Ann Stieglitz. J. B. Lippincott Company, 227 S. Sixth St., Philadelphia 5, 1946.

The customary attitude toward advanced age is one of fear disguised as disregard. At best, old age is looked on as a necessary evil, an undesirable accessory of a state which all of us hope to reach. What do we do about it? The individual's effort may culminate in the provision of an old age annuity. The attitude of the individual is reflected in the attitude of the community and of the country as a whole: federal funds to the amount of more than $400,000,000 are annually allocated to old age assistance, but not one cent of this is used to study the disabilities which prevent these elderly dependents from earning their own way. Dr. Stieglitz, editor of *Geriatric Medicine* and a recognized student of gerontology, has undertaken to present to the lay reader what is known scientifically about old age. The first four chapters deal with the general problem of senescence. Heart, hypertension, nutrition, sex and cancer are discussed in the following five chapters. Then follow chapters on the mental and emotional processes of the aging person, on the importance of proper utilization of leisure, on social significance of aging, and a concluding chapter on constructive medicine. The book is intended for the intelligent reader. It is refreshingly different from most books which attempt to popularize medicine by talking down or by sensationalism. Even the physician will find in it a well written introduction of a new branch of medical practice and research.

Líquido céfalo-raquídeo L. C. R. Por el Dr. Ernesto Daniel Andia, jefe del servicio de clínica neurológica del Hospital municipal "P. Fiorito" de Avellaneda. Paper. Pp. 246, with 108 illustrations. Buenos Aires: Librería y editorial "El Ateneo," 1946.

Every phase of cerebrospinal fluid in its application to clinical medicine is covered. In addition there is a chapter on the origin, circulation and absorption of the fluid. This chapter is profusely illustrated by x-rays of the ventricles and subarachnoid spaces. Most of the illustrations are visualizations through iodine preparations, a method now rarely employed in this country because iodine does not absorb well from the subarachnoid spaces. The author also makes use of encephalograms among his illustrations. The methods of examination presented are those in popular use except for the urea determination. The usefulness of the quantitative determination of this substance is questionable, as is the value of bilirubin, to which the author attaches some importance. Of special interest are the chapters on cerebrospinal fluid in kidney disturbances, in jaundice and in multiple sclerosis and the discussion of stasis of the cerebrospinal fluid. The text is followed by a bibliography of studies by the author and his associates. One feels that additional reference to the work of other investigators would have made the book much more valuable. The volume is a useful compendium for the clinical examination and interpretation of the cerebrospinal fluid.

Monocular Vision Training. By Mildred Smith Evans. Cloth. Price, $3. Pp. 93, with illustrations. Williams & Wilkins Company, Mt. Royal & Guilford Aves., Baltimore 2, 1946.

The unusually large print in this volume is certainly conducive to stimulation of the child with a poor eye. In addition the drawings with the tissue paper for copying are an excellent method to induce the child to take interest in this one-eyed book. There are two suggestions that could be made to make it of more value: some of the drawings should have been in color; then too the price is somewhat high. However, the need of such a book will make available for the many one-eyed children a worth while addition to the armamentarium for orthoptic training.

The Principles of Neurological Surgery. By Loyal Davis, M.S., M.D., Ph.D., Professor of Surgery and Chairman of the Division of Surgery, Northwestern University Medical School, Chicago. Third edition. Cloth. Price, $7.50. Pp. 540, with 197 illustrations. Lea & Febiger, 600 S. Washington Square, Philadelphia 6, 1946.

For over a decade this text book has been one of the standard reference works in neurosurgical problems for students and general practitioners. The fact that it is now in its third edition is ample evidence of its proved usefulness. The stated purpose of the author is to "present easily assimilable facts which will aid in the development of a more accurate concept of neurological surgery" in those practitioners who are not expert neurologists or neurologic surgeons. The volume is carefully divided into chapters on neurologic diagnosis, cranial and intracranial injuries and disease, spinal cord injuries and disease, peripheral nerve injuries, pain, the autonomic nervous system, epilepsy and the lesions more difficult to classify, such as cervical rib and syringomyelia. Of special value and reflecting the progressive outlook of the author are the discussions on the newer concepts in the treatment of the paraplegic and the use of chemotherapy in the infections. Of interest to the general practitioner is an accurate but conservative evaluation of the surgical treatment in essential hypertension. This book can be freely recommended to all those desiring an accurate, interestingly written and well illustrated statement of the principles of neurosurgery.

Conduction Anesthesia: Clinical Studies of George P. Pitkin, M.D., F.A.C.S., F.I.C.A. Edited by James L. Southworth, M.D., and Robert A. Hingson, M.D. With chapters prepared by Winifred Pitkin, M.D., M.R.C.S., and others. Fabrikoid. Price, $18. Pp. 981, with 606 illustrations prepared for the clinical studies under the direction of Dr. George P. Pitkin. J. B Lippincott Company, 227 S. Sixth St., Philadelphia 5, 1946.

This book was begun by Dr. George P. Pitkin. After his death it was completed with chapters prepared by Drs. Winifred Pitkin, A. R. McIntyre, Frederick M. Allen, Waldo B. Edwards, Louis A. Palmer, William T. Lemmon, Lyman W. Crossman and Henry G. Hager Jr. It was edited by Drs. James L. Southworth and Robert A. Hingson. Following a historical introduction there are chapters on anatomy of the cranial nerves, anatomy of the spinal nerves, the autonomic nervous system, pharmacology and toxicology of cocaine and synthetic local anesthetics, shock and principles of conduction anesthesia. A variety of chapters deal with anesthesia in anatomic regions such as the head, blocking the trigeminal nerve, cervical block and other subjects. There is a chapter on spinal anesthesia by the late Louis A. Palmer and one on continuous spinal anesthesia by William T. Lemmon. Refrigeration anesthesia is discussed, as is also therapeutic nerve block. An attempt has been made to present many methods of doing each of the blocks. This book is an attempt to deal in great detail with one phase of anesthesiology. It is to be hoped that the book will be useful, although possibly it will be somewhat confusing to those who are not expert enough to do without it.

Spanish-English Medical Dictionary. Compiled by Maurice McElligott, F. R. C. S., D. P. H. Fabrikoid. Price, $3; 12s. 6d. Pp. 250. Paul B. Hoeber, Inc. (Medical Book Department of Harper & Brothers), 49 E. 33d St., New York 16; H. K. Lewis & Co., Ltd., 136 Gower St., London, W. C. 1, 1946.

This dictionary is now given to the Spanish speaking medical world with confidence but with full knowledge of its limitations. The compiler asks all who consult it to apprise him of any lacunae which they may observe for correction in future editions. Acknowledgment for help is presented through the book to Dr. Josep Trueta of Barcelona and Dr. J. Perera y Prats of Madrid and to Mrs. Isobel W. Brocklehurst, M.R.C.V.S., of the Department of Veterinary Pathology of the University of Liverpool for the list of veterinary terms which appears at the end of the book. More than 14,000 medical terms are translated into English. In these days it is almost imperative for Spanish speaking physicians and scientists to be familiar with English medical terms. On this account the dictionary will be a great help, especially in Spanish medical libraries. The author gives credit to Dr. Joaquin Pi for Pi's Spanish Medical Dictionary, but he does not mention Moll's Spanish-English Medical Dictionary (Dicionario Médico Español Inglés), which was published by the American Medical Association. This omission probably can be excused since copies of Moll's dictionary have not been available for many years. Some of the medical terms are slightly misspelled, as for instance the Spanish word "amoratado-a," which is erroneously written "amoratodo" and the English words "chemiotaxis" and chemotherapy," which are erroneously written "chimiotaxis" and chimiotherapy," although this failing could be corrected in future editions.

Medical Research: A Symposium. Edited by Austin Smith, M.D. Cloth. Price, $5. Pp. 169, with 17 illustrations. J. B. Lippincott Co., 227 S. Sixth St., Philadelphia 5, 1946.

The book opens with a classically beautiful essay by Torald Sollmann, in the style of Claude Bernard, on the fundamentals of medical research. After discussing training, materials, supplies and the like he comes to motives and objectives. Research is seen either as pioneering and adventurous, with "plenty of fun and disappointments," in which a ten-strike is the goal; or, as developmental, an engineering problem, comprising long and carefully planned work. The latter type lacks some of the romance of the former but is more certain to return a yield, even though it be a gleaner's. The systematic and meticulous are most happy with this type, the dreamers of heights with the first. Fortunately, however, men are not simply made, and even "classicists have some of the gipsy in them." Cooperative research, which is at times "a method of production rather than of discovery," is of little use to the pioneer but may be utilized by the developer who can better outline the mechanics of his work. Finally, research is truth. It is also a game of skill and luck, and he wins "who fights for the prize of prizes, the devotion to an exacting ideal."

In the next essay Austin Smith discusses the more practical aspects of research, its expense and financing and the necessity of providing the individual young investigator with freedom for thought, bonuses for ideas and family security. Again, at the present time some problems have answers beyond our horizons; for instance, what will be the ultimate effect of penicillin and the sulfonamides, and of DDT, on the complexity of human environment? Research, even though it is costly and often fruitless, must be pressed to solve such ever new problems in health.

The late Herbert Calvery of the Food and Drug Administration then discusses the laboratory, its building, equipment and supplies, and then its organization. S. DeWitt Clough, chairman of the board of a large pharmaceutical house, describes the manufacture of drugs and particularly the part of industry in the development of new drugs. Also he describes the requirements for safety of the Federal Food and Drug Administration before a drug can be marketed, and the great desirability of cooperation with the Council on Pharmacy and Chemistry of the American Medical Association. If the remedy is "accepted" by this body, the individual practicing physician is impressed that it will be effective as well as safe, because this committee of experts represents his best source of unbiased therapeutic information.

Eldon M. Boyd reviews university research, and especially that principal hazard, administrative responsibilities, when, at the age of 40, the researcher becomes a department head. The solution is, in many cases, a losing one for research. The sometimes forgotten but ever present opportunities for "clinical research with a notebook" are described by Walter Alvarez in his usual interesting and tantalizingly thoughtful case stories. Morris Fishbein concludes the general discussion with a consideration of the publicizing of medical research and the hazards and abuses of public information, yet its necessity.

The last chapter, on photography, is like the laboratory exercises appended to a lecture course. In it is shown what research in one particular field can produce. The most breath-taking picture in the chapter is figure 16, which is the picture of a molecule of hexamethyl benzene, magnified 15 million times by x-ray diffraction, to show the carbon atoms individually in their true spatial arrangement. It is like the boy's first look through a microscope at an utterly new realm.

The book as a whole is delightful reading in itself for researchers. It is additionally valuable because it cannot fail to stimulate other readers to participate in, or to support, ventures into newer knowledge.

Victory Over Pain: A History of Anesthesia. By Victor Robinson, M.D., Cloth. Price, $3.50. Pp. 338, with 47 illustrations. Henry Schuman, 20 East 70th St., New York 21, 1946.

This is a book which should prove both readable and informative to physicians and laymen alike. It is the last of four histories published during the two years preceding the ether centennial. Keys' History of Surgical Anesthesia and Raper's Man Against Pain were published in 1945. Ellis's Ancient Anodynes preceded Victor Robinson's Victory over Pain in 1946. All four are distinct contributions to the subject. However, one cannot avoid the feeling that no comprehensive and accurate history of anesthesia has yet been written in a manner completely satisfying to the physician whose life work is the relief of pain. Doubtless the lack of general use of the word anesthesia previous to 1846 and the frequent publication under other titles of matters dealing with anesthesia since then have caused many of the inaccuracies, omissions and conflicts in opinion found in historical writing.

The termination of the contributions of Victor Robinson to medical literature will be keenly felt among American physicians. His familiarity with the history of medicine obviously stood him in good stead in writing this, his last book. His pleasing style of expression, together with his wide acquaintance with medical history, has produced a book not seriously lacking in accuracy, comprehensiveness or readability. No attempt was made at documentation if one excepts the brief bibliography appended. It is therefore in no sense a reference book for the bibliophile. An adequate index, however, is of aid to the casual student who is not interested in sources. Anecdotes and brief character sketches, together with many illustrations reproducing old prints, portraits and photographs, add interest. This is not a book for scholarly study by the physician in his more serious moods; rather is it a reasonably accurate and fairly comprehensive story, well told, of the world's struggle to date toward the relief of pain.

Renal Diseases. By E. T. Bell, M.D., Professor of Pathology in the University of Minnesota, Minneapolis. Cloth. Price, $7. Pp. 434, with 119 illustrations. Lea & Febiger, 600 S. Washington Sq., Philadelphia 6, 1946.

This monograph is a worthy product of an expert on renal disease. It is in part a compilation of studies made by the author during the past twenty-five years and includes a large amount of previously unpublished data. The text is clearly written and is illustrated by a superb choice of photomicrographs. Only the four color plates could be improved on in their reproduction. The development of the subject follows Bell's classification of renal disease. The text is introduced by chapters on normal renal histology and normal and abnormal renal function. In addition to the discussion of the structural changes in the kidneys, the pathologic physiology and the clinical manifestations of each disease are well treated. Although only the rationale of treatment is presented, the author indicates his choice for further study of special papers on therapy. The field of renal diseases is thoroughly covered, including renal function and structural changes associated with hypertension, the toxemias of pregnancy and the renal lesions of diabetes. This monograph undoubtedly will help to bring about closer cooperation between the pathologist and the clinician and will be of value to all interested in the problems of renal disease.

La cultura in vitro del midollo osseo: Problemi di fisiopatologia ematologica studiati con la tecnica della cultura dei tessuti. Di Aminta Fieschi e Giovanni Astaldi. Prefazione di Cesare Frugoni. Paper. Price 1,000 lire. Pp. 309, with 122 illustrations. Tipografia del Libro di S. Bianchi, Pavia, 1946.

This excellent book presents the results of the study of human marrow (normal and in pernicious anemia, chronic and acute leukemia, erythroblastosis and Cooley's disease) by the tissue culture method. Plasma cells were found to originate from plasma cell blasts and megaloblasts from histioblasts, with replacement, under liver therapy, by transitional and later normoblastic forms. Cells from acute leukemia have a long survival time in contrast to those of chronic leukemia. The book is well printed, with beautiful illustrations, some in color. The conservative attitude toward controversial subjects makes it a valuable authority on the subject.

Queries and Minor Notes

The answers here published have been prepared by competent authorities. They do not, however, represent the opinions of any official bodies unless specifically stated in the reply. Anonymous communications and queries on postal cards will not be noticed. Every letter must contain the writer's name and address, but these will be omitted on request.

ESTIMATION OF SERUM ANTIBODIES AGAINST INFLUENZA VIRUS

To the Editor:—Where can one obtain antiserum for influenza A and B for measuring antibodies in the serum of patients? How stable is this material and how long will it remain potent in an ordinary refrigerator?

Robert B. Rodman, M.D., Wilmington, N. C.

Answer.—Antibodies against influenza A or influenza B viruses in serum of patients have been estimated by a number of different technics, including tests for virus neutralization, for complement fixation and for the capacity to inhibit the agglutination of chicken erythrocytes in vitro. For each of these procedures a suspension of virus or a preparation of viral antigen is required.

The simplest and most convenient technic available at present for measuring antibodies against influenza viruses are based on the capacity of influenza viruses to cause the agglutination of erythrocytes in vitro and the fact that the hemagglutination can be specifically and quantitatively inhibited by appropriate antibody (Hirst, G. K.: *J. Exper. Med.* **76**:195 [Aug.] 1945). Virus is grown in the chorioallantoic fluid of developing chick embryos and, for use in tests of this kind, may be kept in an ordinary refrigerator at approximately 4 C. for many months.

As far as we have been able to determine, preparations of influenza viruses suitable for use in tests to measure antibody in serum are not yet available from commercial sources. Strains of virus can probably be obtained if requested from laboratories in which the influenza viruses are being propagated and studied.

PLACENTA ACCRETA

To the Editor:—Are there any statistics available as to the recurrence of placenta accreta? The placenta accreta was found in a patient who was delivered by cesarean section. The placenta was removed with the loss of some uterine tissue. What would be the possibility of a recurrence of this condition in a subsequent pregnancy? Would this condition occurring in the first pregnancy increase the possibility of spontaneous rupture of the uterus in subsequent pregnancies?

M.D., Minnesota.

Answer.—Reports of a repetition of placenta accreta in the same patient have not been found. Theoretically if the uterus is not removed for placenta accreta, as it should be in most cases, there can often be a recurrence of the condition. In most cases of partial as well as complete placenta accreta the decidua basalis is either absent entirely or it is present as groups of cells in the compact layer. Hence the fertilized ovum is implanted directly on the myometrium and not on a decidua. This occurrence explains the failure of separation of the placenta after delivery and also the profuse hemorrhage which takes place when an attempt is made to separate the placenta from the uterine muscle manually. If the decidua is absent this may mean that the endometrium was deficient before gestation occurred or that the endometrium failed to be transformed into a satisfactory decidua because of hormonal disturbances. In either event, if the uterus is not removed it is possible for the endometrium to be regenerated sufficiently to permit normal implantation of an ovum followed by a normal pregnancy and labor. In the literature there are reports of 14 women in whom the placenta was permitted to remain intact without any attempt at removal and no operative procedure was followed other than packing or draining. All of these women survived. In fact 2 women treated in this way subsequently gave birth and had no complications in the third stage of labor.

In a case like that cited, if considerable uterine tissue was removed with the placenta there may be a distinct risk of rupture of the uterus in a subsequent pregnancy, not only because of the thinning of the uterus at this point, but also because all the decidua, if there was any, was removed, including the compact layer. In 11 cases of placenta accreta reported in the literature spontaneous rupture of the uterus took place. In 15 cases the diagnosis of placenta accreta was made at cesarean section, the indications for which were placenta previa, fibroids, disproportion and other conditions. (See Kaltreider, D. F.: *Bull. School of Med., Univ. Maryland* **30**:1 [July] 1945.)

SEDATIVES AND POSTOPERATIVE VOMITING

To the Editor:—Not rarely one sees patients who must have opiates for relief postoperatively but who have intractable vomiting from any of them that I have tried, including morphine, pantopon, dilaudid and codeine. Demerol seems less likely to bring about vomiting but frequently seems to give little pain relief. Is there any means of obviating the vomiting occurring after the administration of these drugs?

M.D., Alabama.

Answer.—The question may well be raised as to whether or not the drugs in question produce the vomiting or whether the vomiting is due to ileus, acute dilatation of the stomach or some other complication. Certainly in the hands of many surgeons these drugs are only infrequently accused of producing severe vomiting.

However, the opiates as a group are capable of inducing vomiting in occasional persons, even to the point of precluding their further use. Codeine and dilaudid (dihydromorphinone hydrochloride) are presumed to be more easily tolerated than morphine. The concomitant use of atropine or sedatives may also be helpful. Demerol (meperidine hydrochloride) is often a satisfactory alternative and, although not a highly potent analgesic, is ordinarily adequate to control postoperative pain.

NURSING BY SYPHILITIC MOTHER

To the Editor:—Please discuss the use of mother's milk when it is positive for syphilis. Kline and Kolmer serologic tests of the baby are negative. The mother's blood is Kline and Kolmer positive.

E. W. Pillstrom, M.D., Ozark, Ark.

Answer.—The inquirer's meaning as to mother's milk which is "positive for syphilis" is not clear. Does this mean that the milk has been demonstrated to contain Treponema pallidum by means of its injection into experimental animals or that a serologic test for syphilis has been done on the milk? Both of these seem highly improbable. Little is known about the infectiousness of milk for animals. Serologic tests on milk have been done experimentally, but their result is not an indication of the infectiousness of the milk.

Whether a normal infant born of a syphilitic mother should be breast fed depends not on the mother's blood test but on the duration of her infection and the character and amount of antisyphilitic treatment she has had prior to the infant's birth. If the mother has been recently infected, i. e. within two years of the birth of the infant, and regardless of the amount of treatment she may have had before delivery, it is probably undesirable for the infant to nurse unless the mother's treatment is continued during the period of lactation. This has to do not with the possible infectiousness of milk, which is unlikely, but instead with the possibility that the mother may develop a relapsing infectious lesion on or about the nipple, through which the infant may develop an extragenital chancre.

If the mother has had syphilis more than two years before the birth of the infant and whether or not she has been previously treated, it is probably entirely safe for the infant to nurse.

This question is discussed in detail on page 499 of Moore, J. E.: The Modern Treatment of Syphilis, ed. 2, third printing, Springfield, Ill., Charles C Thomas.

NIKETHAMIDE FOR HICCUP

To the Editor:—Based on the rationale that powerful stimulation of the respiratory center as by carbon dioxide inhalation terminates an attack of hiccup in most cases, I have tried the intravenous injection of nikethamide in 2 to 5 cc. doses, just enough to produce deep respirations. Most of the patients had cardiovascular disease. The action of the drug was prompt and reliable in stopping the attack. If the hiccup returned after the drug action wore off, the dose was repeated, with the same effect. References have not been found in any standard textbook on the use of nikethamide in this condition. It would be interesting to try this drug on patients who are or have become refractory to the inhalation of carbon dioxide.

Felix Schell, M.D., Passaic, N. J.

Answer.—The inhalation of 7 to 10 per cent carbon dioxide acts as a powerful stimulant to the respiratory center and probably takes precedence over the reflex stimulation of the diaphragm. However, in most cases the hiccup stops when the patient verges on loss of consciousness and appears to be in part related to the generalized muscular relaxation that follows. Nikethamide is a powerful respiratory stimulant which might also take precedence over the habit reflex diaphragmatic spasm.

Subcutaneous injection of 0.5 cc. of ether also promptly stops hiccup. This results in intense momentary pain. With the use of ether and carbon dioxide the cessation of hiccup is frequently temporary, but repeated use of either procedure usually results in permanent cure. It would be interesting to try other cases with nikethamide and probably also with metrazol.

VICARIOUS MENSTRUATION

To the Editor:—What recent information is there with reference to vicarious menstrual bleeding? A patient for many years has had a Vincent's infection in her mouth, having also a good deal of bleeding from her gums. This infection was treated with apparent success and the bleeding from the gums stopped, except during the normal menstrual period, at which time her gums bled rather profusely. I have given no treatment to date. Can you advise me what I might do? Would I be correct in assuming that pregnancy would discontinue this bleeding?

James Frenkil, M.D., Baltimore.

Answer.—There has been no new information concerning vicarious menstruation. The type which this patient has is called "supplementary vicarious menstruation" to distinguish it from true "vicarious menstruation," a condition in which the periodic bleeding occurs from various parts of the body, usually mucous membranes, but not from the uterus. The cause of this condition is unknown. According to many investigators there is during menstruation an increased capillary permeability involving the whole body which may have a bearing on vicarious cyclic bleeding. The periodic bleeding will almost certainly cease during pregnancy. There is some relationship between the mucous membranes, especially of the nose, and the estrogens. However, true vicarious menstruation has been reported in women after the menopause, after hysterectomy and following bilateral oophorectomy; hence the relationship between this type of bleeding and the sex cycle may be questioned.

Unfortunately there is no specific treatment for vicarious menstruation; hence therapy is empirical. The estrogens have helped some patients but have had no effect in others. If bleeding points can be seen they should be cauterized. Vitamins C and K should be administered, although they may not do any good.

SYNCOPE

To the Editor:—A woman aged 59 has had attacks or spells for about two years in which she has dizziness and a sensation of cessation of circulation with numbness embracing the entire body. During this period of syncope the veins in the fingers and hands suddenly swell and become pronounced. After stimulative treatment, rest and massage these veins disappear completely, the body circulation is resumed and the sensation of numbness leaves her. The patient has had two severe attacks in the two year period and numerous mild ones. Her first warning of the oncoming attack is a sensation as if there were running water inside the head with a sort of sizzling noise in the back of the head. The patient had the menopause thirteen years ago. She has had no operation nor serious illness. At the time of the first serious attack her blood pressure was very low. At present the blood pressure is 130/85. The heart is normal. The weight is 170 pounds (77 Kg.), the height 5 feet 7 inches (170 cm.). The patient has varicose veins.

Morris H. Pett, M.D., Gloucester, Mass.

Answer.—In order to arrive at a definite diagnosis, additional data are required. If the syncope is transitory in nature and the attacks occur in the standing or sitting position, a reflex syncope is suggested probably caused by a hypersensitive carotid sinus. The diagnosis can be established by artificial reproduction of the spontaneous attacks through stimulation of the carotid sinus (Weiss, Soma; Capps, R. B.; Ferris, E. B., Jr., and Munroe, Donald: Syncope and Convulsions Due to a Hyperactive Carotid Sinus Reflex, *Arch. Int. Med.* **58**:407 [Sept.] 1936). If the attacks occur at the time the patient assumes the erect position, blood pressure determinations may show a postural hypotension. On the other hand, if the attacks occur in any position an epileptic seizure is more likely. It would be useful to know the condition of the pulse in attacks, as various forms of cardiac arrhythmias may be the causative mechanism.

The swelling of the veins is probably the result of vasodilatation, which may involve the veins as well as the rest of the vascular bed.

MATURATION OF SPERMATOZOA

To the Editor:—What is the length of time for development of spermatozoa from the primitive germ cell to mature spermatozoa?

M.D., Arizona.

Answer.—Little is actually known on this problem. It is probable that different species require different lengths of time for the process. In the newborn rat and hamster, seminiferous tubules are solid and show a lumen and cellular activity about the sixteenth day, with spermatozoa appearing about the thirty-sixth day; this would represent a total period of twenty days from lumen formation to spermatozoa. In mature rats, on the basis of length of a spermatogenetic wave it has been estimated that from the spermatogonium to spermatozoon requires twenty days. Data are not known for man.

Just formed spermatozoa are probably not physiologically mature. The epididymis appears to exert some influence on sperm as they pass through, and apparently some days are required (estimated at six to ten or more days) to gain full physiologic maturity.

POSTTRANSFUSION DEATH IN INFANT

To the Editor:—A boy aged 4 months was hospitalized because of extreme emaciation and dehydration resulting from chronic diarrhea and improper feeding. The birth weight was 6 pounds 9 ounces (2,983 Gm.), the admission weight 7 pounds 6 ounces (3,176 Gm.). On admission he was given 250 cc. of citrated whole Rh positive blood by marrow transfusion. This was followed by clysis of lactate-isotonic solution of three chlorides, milk formula and other fluids by mouth. The patient improved during the next two days. Forty-eight hours after the first transfusion another 250 cc. of blood was given by bone marrow transfusion from the same donor. Immediately after completion of the transfusion the temperature rose to 105 F. and the skin became bluish. About two hours later a firm ecchymotic area developed in the lower abdominal wall and upper part of the left thigh. Puffiness of the subcutaneous tissues developed, particularly about the eyes. There was hemoptysis of bright red blood and passage of a small amount of blood by rectum. The subcutaneous bleeding continued until the entire surface of the body was involved, with the exception of the face. The patient's blood was Rh positive. Postmortem examination showed bleeding into most of the soft tissues of the body. Please discuss the course of events in this case. Under such circumstances how rapidly could Rh antibodies be formed so as to cause a similar succession of events? Is it possible that the patient had an Rh negative blood and that the transfusion of large amounts of Rh positive blood accounted for the laboratory's report of Rh positive blood?

M.D., Arizona.

Answer.—Posttransfusion hemorrhages are rare, and those recorded have occurred almost without exception in patients with a hemorrhagic tendency prior to the transfusion. They included retinal hemorrhages and occasional meningeal hemorrhages.

The theoretical blood volume of this infant (weight 7 pounds 6 ounces) was in the vicinity of 300 cc. He was given 250 cc. of blood, or approximately five sixths of his whole blood volume. This is equivalent to giving about 5,000 cc. of whole blood to a person weighing 140 pounds (63.5 Kg.).

It has been recommended not to give infants more than 10 cc. of blood per pound of body weight. According to this the infant received at least three and one half times the maximum permissible amount of blood.

The findings are best explained by a summation of three factors: (1) the possible hemorrhagic tendency, (2) the damaged myocardium and (3) the tremendous overloading of the circulation (approximately twice the total normal blood volume was added within forty-eight hours over and above the child's own blood). All three contributed to the heart and circulatory failure and hemorrhages.

The Rh factor had nothing to do with the reaction. Even if the infant was Rh negative the antibodies could not develop forty-eight hours after the first transfusion in an infant of this age. Transfusion reactions due to the Rh factor are of hemolytic nature with a clearcut clinical picture, and necropsy findings which are not described in this case.

If this child was Rh negative the finding of Rh positive blood could have been explained by the transfusion of large amounts of Rh positive blood, though the method of differential agglutination could show the presence of some Rh negative blood remaining unclumped.

CHEMICAL DÉBRIDEMENT OF BURNS

To the Editor:—What are the advantages of using saline-glycerin-acetic acid mixture of pH 3.8 in the treatment of burns? How is it used? Have any later methods of treatment of burns appeared?

M.D., New York.

Answer.—The use of saline-glycerin-acetic acid mixture for burns is a method of chemical débridement. The need for such measures is predicated on the common observation that the frequently necessary skin grafting in third degree burns is often needlessly delayed for several weeks by slow separation of the slough.

Chemical débridement attempts to hasten slough dissolution and to permit early skin grafting. Acetic acid was used for this purpose by Dorrance and Bransfield. Connor and Harvey used pyruvic acid at a p_H of 1.9 in 8 per cent corn starch both clinically and experimentally and found that the slough of experimental burns could be removed in forty-eight to seventy-two hours and could be followed with early skin grafting. Certain of the burns treated after the Hartford circus disaster received this treatment. Lam and Puppendahl did experiments that indicated little value in the method. The latter authors suggested that the favorable effect on sloughing obtained with pyruvic acid paste is due more to maceration than to the acid p_H. Chemical débridement is, however, still used by certain specialists in the field. Generally, however, surgical débridement is used in the form of excision of the slough at or shortly before the time of grafting.

Chemical débridement can also be applied in the form of an enzymatic digest as used by Cooper, Hodge and Beard.

If the saline-glycerin-acetic acid mixture is used, it should be applied to the burn as a compress, either immediately or at the first change of dressing.

The most widely accepted form of burn treatment at the present time is the compression method. This involves rapid covering of the burn under aseptic precautions, holding of the dressing in place with a voluminous compression bandage and keeping the cover intact without change for at least ten days after the injury (Allen and Koch). The inner layer of this dressing is of fine mesh gauze and may be applied either dry, moistened with saline solution or petrolatum or, more rarely, impregnated with other medicaments.

INTRAVENOUS BARBITURATES FOR ORAL SURGERY

To the Editor:—Please discuss the use of pentothal sodium in oral surgery, particularly dental surgery. G. A. Goshgarian, M.D., Waukegan, Ill.

Answer.—The intravenous barbiturates have been used extensively to provide anesthesia for operations in the mouth, and many workers have produced satisfactory results in this way. There are certain reasons, however, for which intravenous anesthesia for these purposes is open to criticism. Complete patency of the respiratory passages is of paramount importance because of the depression of respiration to which the barbiturates give rise. Because of the nature of the operation the "airway" is prone to become obstructed. Laryngospasm may easily occur unless a large dose of the drug is given before the intensely "painful" stimulus of dental extraction. Operations in the mouth are often performed in the sitting position, and some feel that the relative cerebral ischemia in this position predisposes to circulatory collapse. Reference is made to Intravenous Anesthesia by R. Charles Adams (New York and London, Paul B. Hoeber, Inc., 1944, pp. 517-519).

MIGRAINE ASSOCIATED WITH MENSTRUATION

To the Editor:—A woman aged 30 has suffered severe premenstrual migraine headache, lasting three days and ending with the onset of menstruation, during the past two years, since marriage. A year ago she had her first and only pregnancy, ectopic, requiring resection of a tube and ovary. This did not affect the migraine, which is relieved only by repeated injections of sodium nicotinate intravenously during the attack. Last month she received 10,000 units of estrogenic substance twice weekly for the entire menstrual cycle, and the migraine was worse than ever. Physical examination is negative; blood count and urine are normal. Would desensitization with autogenous serum help if taken between attacks?

Bernard Marcus, M.D., Raritan, N. J.

Answer.—Migraine associated with the menstrual cycle is extremely difficult to treat satisfactorily. A specific treatment thus far has not been brought forth.

GENERALIZED PRURITUS

To the Editor:—A woman aged 38 has had severe pruritus for the past eighteen months which is generalized over the entire body including the vulva and anus. Her past history is entirely negative except for an amenorrhea for twelve months. *The patient has been given sedatives,* theelin and local applications without effect. Because of the severity of the pruritus, especially at night, she has indulged in alcohol for the past six months "to be relieved." *Mental sequelae are feared unless the* patient improves. A recent thorough study was made in a Philadelphia hospital including a dermatologic examination. "Nerves" was the only diagnosis established. Please suggest further treatment.

M.D., Pennsylvania.

Answer.—The generalized pruritus almost certainly has no connection with the amenorrhea, which it preceded by about six months. Therefore it is hardly likely that restoration of regular menstruation, even if it can be accomplished, will relieve the itching. The fact that the pruritus involves the entire body and that careful physical and dermatologic examinations have failed to reveal a cause leads one to believe that there may be a large psychic element in the pruritus. In this event sedatives and local treatment will not give permanent relief. The patient should be seen by a psychiatrist, but it may be wise first to have another dermatologic consultation.

TREATMENT OF MIGRAINE

To the Editor:—Please let me know the rationale concerning the use of nicotinic acid, nicotinic acid amide and sodium nicotinate in the migraine variety of headache. Which of these preparations would be most helpful in migraine? Would you also please let me know where sodium nicotinate may be obtained? Is the use of gynergen for migraine any longer acceptable?

M.D., Connecticut.

Answer.—The treatment of migraine is still not as clearcut as might be desired. The explanation for the use of vasoconstricting drugs in some cases and vasodilating preparations in others is to be found in the apparent recognition of two types of migraine: (1) attacks with primary vasodilatation and (2) attacks with evanescent primary vasoconstriction followed by more prolonged vasodilatation. Nicotinic acid and sodium nicotinate are rationally employed in the early, transient vasoconstriction phase of the second type of migraine. The use of nicotinic acid amide is totally irrational for either type of migraine; the drug possesses neither vasodilating nor vasoconstricting properties. Nicotinic acid and sodium nicotinate would seem to be equally effective when used in equivalent quantities. Sodium nicotinate may be obtained from the Drug Products Company, Inc., Long Island City, N. Y.

Ergotamine tartrate (gynergen) is still one of the most effective drugs for use in the majority of migraine attacks, the resultant vasoconstriction acting against intracranial vasodilatation whether primary or secondary.

ANTIHISTAMINE DRUGS AND HYPERTENSION

To the Editor:—A man aged 49 has been having attacks of hay fever for the past several years. During the last year or two he has developed a hypertension which responded to medical attention and rest. During the past year benadryl was prescribed and relief obtained from his hay fever. At the same time, however, he developed a high blood pressure, 192/120. Kindly advise whether or not the use of benadryl or pyribenzamine is indicated in this type of case. His pressure now is normal, 140/80.

M.D., New Jersey.

Answer.—It is definitely not the customary action of either benadryl or pyribenzamine to produce a hypertension. As a matter of fact, although extensive studies have not as yet been reported on that phase, the present evidence (Friedlaender, Sidney, and Feinberg, S. M.: *J. Allergy* **17**:129 [May] 1946) seems to indicate that there is a tendency for these drugs to lower blood pressure. It should be added that any drug may on rare occasion exhibit side reactions decidedly different from its usual ones: hence the inquirer's observation should be rechecked on the particular patient.

ASTHMA AND ALTITUDE

To the Editor:—A patient with long standing asthma is under my care and is contemplating a trip from Ohio to California. Would traveling in an airplane be harmful to him? Would the high altitude affect him in any way?

M.D., Ohio.

Answer.—Asthma is not caused by anoxia, nor is the usual attack of asthma associated with anoxemia. The latter phenomenon is discernible only in the severe stages of status asthmaticus. On the other hand the high altitudes, owing in part to lesser amounts of air borne allergenic and nonallergenic irritants, lesser humidity and other conditions less easily understood, frequently improve the asthmatic condition. Unless the patient has cardiac decompensation the altitude should not harm him.

ANGULATION OF PENIS DUE TO SHORT FRENUM

To the Editor:—A patient complains that on complete erection the head of the penis bends sharply downward interfering seriously with intromission. There is no history of venereal disease. This is not a case of plastic induration of the penis (Peyronie's disease). Examination is otherwise negative. What can be done for this condition?

M.D., New York.

Answer.—An abnormally short and probably fibrous frenum can cause downward angulation of the head of the penis on erection. The treatment for the condition is surgical division of the frenum.

Q FEVER IN THE UNITED STATES

I. Epidemiologic Studies of an Outbreak Among Stock Handlers and Slaughterhouse Workers

NORMAN H. TOPPING, M.D.
CHARLES C. SHEPARD, M.D.
Bethesda, Md.
and
J. V. IRONS, D.Sc.
Austin, Texas

During the month of March 1946 there occurred in Amarillo, Texas, an explosive outbreak of an acute febrile illness which has since been identified as Q fever. The other papers in this series will give the details of the clinical features observed in the cases and the evidence on which the diagnosis of Q fever depends. It is the purpose of this report to give the background of the outbreak with descriptions of the industries involved as well as the sequence of events pertinent to the epidemiologic investigations.

Amarillo is a city of about 70,000 inhabitants located near the center of the Texas panhandle. It is surrounded by country well suited to the raising of livestock and thereby has become a center for this industry. Since the city is situated at the junction of several large railroads by which cattle are shipped to the east, a feeder station has been established there for cattle in transit. The owners of this stockyard which serves as the feeder station also own a livestock auction company, one of the largest in the United States. Nearby, under entirely separate ownership and management, is a packing plant where livestock are killed and dressed for the local market.

All the cases of Q fever which occurred during the explosive outbreak in March were among the employees of these three places or those associated with the handling of the livestock. Three cases occurred in a train crew of 3 occupied in switching cattle trains in and out of the stockyards. Three cases occurred in 4 brand inspectors employed by the Southwestern Cattlemen's Association. They inspected the brands on cattle being sold at auction and occupied a small office in the stockyards. Fifteen cases occurred among 22 employees of the stockyard, 3 cases occurred among 10 regular employees of the auction sales company, and there were 31 cases among 97 employees of the packing plant. There was, then, a total of 55 cases of Q fever among 136 people exposed, an attack rate of 40 per cent.

As the epidemiologic investigations were made from four to six weeks after the outbreak, it was decided to use the employers' absentee records to establish approximate dates of onset for those sufficiently ill to require time off from work. The 15 cases at the stockyard occurred between March 7 and 29, 50 per cent of the cases occurring on or before March 10. The 31 cases at the packing plant occurred between March 10 and 19, with 50 per cent on or before March 14. The cases in the employees of the auction company and those in the members of the train crew occurred about the same time as the cases in the employees of the stockyard.

All the stockyard employees except 1 were engaged in loading and unloading livestock from railroad cars and trucks and in feeding and watering them while they were in the pens of the yard. The 1 exception was a woman bookkeeper in the stockyard office which was alongside the loading docks and in the midst of the pens. She and 14 men employees had Q fever.

The train crews bring the cars to the loading dock and often stand there while cattle are loaded or unloaded. They also spend considerable time in the stockyard office, where there is a stove and a soft drink dispenser. The brand inspectors occupy an office in the same building but work in the pens. Frequently it is necessary for them to clip the hair of cattle in order to see the brands properly.

The auction sales company office is less than 100 yards from the office of the stockyards. The space between is filled with innumerable pens for cattle. The livestock auctions are held on Monday and Tuesday of each week. There are only 10 regular employees, but on sales days between 80 and 100 people are employed, most of them as handlers of the cattle to be sold, the remainder as clerical help and auctioneers. On a usual sale day between 2,000 and 3,000 head of cattle are sold at auction, each animal being driven around a small ring before a crude amphitheater, in which the prospective purchasers are seated. For the most part, the cattle being sold are trucked in the evening before or the morning of the sale; occasionally some arrive by train. While in the pens they are fed and watered by the employees of the stockyard, as well as by some of the regular employees of the sales company. Two of these latter had mild illnesses; the third case among the sales company employees, which was also mild, occurred in a woman bookkeeper.

The packing plant lies about half a mile from the buildings and pens of the stockyards and sales company. It is composed of the main building of three stories and a one story office wing. There are many pens for stock along one side of the grounds connected with the killing room in the main building by an open cattle chute. In the month preceding and during the outbreak there were 18 employees on the killing floor primarily engaged in the killing, skinning and dressing of cattle and hogs.

From the Division of Infectious Diseases, National Institute of Health (Drs. Topping and Shepard) and Director of Laboratories, Texas State Health Department (Dr. Irons).

In 12 of these 18 men Q fever developed. There were 3 men employed in the boning department. Their job consists in cutting the meat from the skulls of cattle and hogs. Q fever developed in all 3, and 1 of them died. Three men were employed in the tankage department which opens onto the killing room, where they frequently work in the event of illness of the regular employees They handle the remains of the carcasses and process them into tankage. Two of these 3 men acquired Q fever. Five men were employed in the curing department, which is a large room in the basement directly under the killing room and connected with it by way of an open chute. The hides are stripped from the freshly killed animals and dropped through this open chute from the killing floor. The men in the curing department then stretch them on piles of hides and place the curing materials on them. Three of the 5 men employed in this department contracted Q fever. Eighteen persons, 10 women and 8 men, are employed in the sausage department. The sausage is of various types and is made from both beef and pork. The men do most of the handling of the raw meat in sausage preparation, and most of the women are occupied in the handling after the sausage has been placed in the casings. In 5 of the men in this department Q fever developed, and 1 of them died. There were no cases among the women.

Summary of Number and Occupation of Employees and Incidence of Q Fever at the Packing Company

Department	No of Employees	No of Cases of Q Fever
Killing floor	18	12
Boning	3	3
Lard	1	1
Tankage	3	2
Curing	5	3
Sausage	18	5
Upkeep	9	1
Cooler and bacon	5	0
Buyer	2	0
Delivery	15	2
Office	18	2
Totals	97	31

The 1 man employed in the lard department also doubled frequently on the killing floor. He contracted Q fever. Of 9 employees having to do with upkeep, such as engineers and carpenters, only 1 had the disease. He was a yardman who took care of the stock in the pens and drove them up the chute to the killing floor. In neither of the 2 cattle buyers did the disease develop; this was also true of the 5 employees engaged in the preparation of bacon or working in the pork cooler. Among 18 employees in the offices there were only 2 cases, both in workers who handled fresh meat for delivery to consumers' trucks. Of 15 plant delivery men, only 2 contracted the disease. The accompanying table summarizes, by occupation, the number of employees at the packing company as well as the cases of Q fever.

In reviewing the experience at the packing company it will be noted that the disease primarily affected those engaged in killing the animals and handling the freshly killed meat. If the 8 men who worked in the sausage department are added to the first five categories in the summarization table, we see that of 38 employees there were 26 cases, an attack rate of 68 per cent. The remainder of the employees, including the 10 women in the sausage department, total 59 with only 5 cases of Q fever, an attack rate of only 8 per cent. These 5 also had rather close contact with the animals or their products.

The slaughtering records for the packing company revealed that from February 15 to March 22 only one lot of sheep was killed, and this was a small group of 18, on March 9. The first case of Q fever here was on March 10.

Since the incubation period for Q fever is thought to be fourteen to twenty-six days, the sheep obviously were not involved in the beginning of the epidemic. Large numbers of hogs were killed during the same period, but the companies' records indicated that these were purchased in lots of 1 to 20 from individual farmers who truck the hogs into the packing plant. At no time were any of these hogs in the pens of the stockyards, nor did they go through the sales company. Therefore these hogs could have been the cause of the outbreak of Q fever among the packing plant employees but certainly were not the cause of the outbreak among the employees of the other two companies.

During the period February 15 to March 22 many cattle were slaughtered. Some were purchased from individuals, but most were purchased from one or the other of the two livestock auction companies in the city. More than half the cattle purchased during this period had been purchased through the sales company in whose employees Q fever had occurred. The other auction company had had no cases among its help as far as could be determined and therefore was dismissed from further consideration.

By checking the records of the sales company it was found that with the exception of one lot the cattle were trucked into the pens either the evening before or the morning of the sales. The one lot that was the exception consisted of 41 white faced heifers that were shipped into Amarillo, Texas, by rail and were unloaded at the stockyard on February 23. They went through the auction ring of the sales company on February 25, were delivered to the packing plant on the morning of February 26 and were slaughtered the same day. This single lot of 41 cattle fulfilled the necessary requirements of having arrived by rail, of having spent several days in the pens of the stockyard, of having been sold through the sales company and, finally, of having been slaughtered and processed at the nearby packing plant. The time interval between reception of this lot of cattle in the stockyard (February 23) and the date on which 50 per cent of the cases of Q fever among stockyard employees occurred (March 10) is sixteen days. The time interval between the date (February 26) the cattle were slaughtered and processing begun at the packing plant and the date (March 14) on which 50 per cent of the cases among packing plant employees occurred is seventeen days. These agree well with the fourteen to twenty-six day incubation period thought to exist in Q fever.

Nothing unusual was found on further investigation of these 41 head of cattle. They were approximately yearlings when slaughtered. They, together with other cattle, had been purchased in November 1945 from around Portales and Clovis, N. Mex., and Wheeler, Texas. They had grazed on a ranch near Bovina, Texas, from November 1945 until Feb. 22, 1946, when they had been shipped by rail to Amarillo for sale. No history of illness could be elicited. This is not an unusual history of frequent sales and movement of cattle in Texas. From the same ranch and same lot of cattle 171 steers had been shipped to Colorado on February 26. They were unloaded, fed and watered but then reloaded at the stockyards in Amarillo while in transit to Colorado.

In search of a history of possible vectors on the cattle coming into the packing plant in Amarillo, we were told by many that the presence of ticks on the cattle in that vicinity was extremely rare. On examination of many cattle in the yards, no ticks were found during the early part of May 1946. Rats were trapped both at the packing plant and the stockyards, but nothing unusual was noted either in the gross pathology or the ectoparasites found on the rats. Eleven samples of serums from the rats had no agglutinins for Rickettsia burneti.

COMMENT

In the analysis of the data several interesting inferences can be drawn. First, even though the employees of the stockyards, sales company and packing plant had for the most part been long engaged in their respective occupations, they as a group did not exhibit immunity to Q fever. It might be inferred that this outbreak represents their first effective exposure to the disease. Second, since no evidence was obtained implicating arthropods and since there was no evidence of spread from person to person, the mode of infection is in doubt. In the packing plant the handling of freshly killed meat certainly carried with it a high risk of infection. There the outbreak was explosive, since all 31 cases occurred within a nine day period. This leads one to the assumption that the infectious agent did not long remain in the packing company; although there were still persons who were susceptible, more cases did not occur after the nine days. The situation in the stockyards, however, was different. Here the risk involved every one exposed to living cattle, and although the first case among these employees occurred three days before the first case at the packing company, the last case occurred ten days after the outbreak at the packing company was over. Therefore, it would seem that the infectious agent was present in the stockyards for a considerable period. It may have been in the dust, as was suggested in one laboratory outbreak,[1] and it may have gotten there from the excreta of the cattle. The rickettsia of Q fever has been isolated from the urine of guinea pigs for considerable periods of time subsequent to infection,[2] and R. burneti is known to be resistant to many agents which are lethal for most micro-organisms.[3] Third, it would seem that cattle can be infectious for stock handlers even though the cattle themselves do not appear ill or exhibit any remarkable gross pathologic conditions during processing.

SUMMARY

An outbreak of Q fever occurred in stock handlers and slaughterhouse workers in Amarillo, Texas, in 1946. There were 55 cases and 2 deaths among 136 employees of three establishments, an attack rate of 40 per cent. The epidemiologic investigations revealed that cattle were probably the source of the human infections in this particular outbreak.

Q FEVER IN THE UNITED STATES

II. Clinical Data on an Outbreak Among Stock Handlers and Slaughterhouse Workers

J. V. IRONS, D.Sc.
Austin, Texas
and
JOHN M. HOOPER, M.D.
Amarillo, Texas

In March 1946 there occurred at Amarillo, Texas, an explosive outbreak of acute febrile illnesses which was shown [1] to be closely related to or identical with Q fever. The other papers in this series deal with the epidemiologic, serologic and rickettsial data on this outbreak. It is the purpose of this report to present some of the clinical features observed in these cases. The clinical data were obtained mainly from the 18 hospitalized patients since the remaining 37 patients treated at home, although the cases were similar, were not so completely observed. While several of those who remained at home were seriously ill, other employees contracted mild, influenza-like illnesses and in 1 or 2 instances remained at work during the illness. Six instances of probable subclinical or inapparent infection were uncovered through serologic tests for Q fever on workers presumably exposed to the disease but without a history of subsequent illness.

The onset in nearly all cases was fairly sudden but usually was not severe. In an occasional case the onset was somewhat insidious. The illness was usually ushered in by constitutional symptoms, with few if any symptoms referable to the respiratory tract. Two patients complained of troublesome and persistent nasal discharge, possibly resulting from recurrence of sinusitis. The onset usually was characterized by headache, chilly sensations, general malaise and, sometimes, nausea or vomiting. Frequently there was a latent period of from one to three days following the onset, and in some instances the patient returned to work or continued to work while feeling ill.

Severe and persistent headache was a common complaint, which developed early in the illness. Occasional patients also complained of nuchal pain. Other common complaints on admission to the hospital were feverishness, weakness, anorexia, soreness of the chest, generalized bodily aches and pains and chilly sensations. Frank rigors were experienced by 5 patients. Some patients experienced nausea and vomiting. Diarrhea and other evidence of gastrointestinal infection were uncommon. During the period of hospitalization drenching sweats were frequent and insomnia also was troublesome. In 5 of the most severe infections the patients became drowsy or even stuporous.

Several patients contracted a slight cough, which generally was nonproductive or productive of a small amount of thick, tenacious, white or occasionally blood-tinged mucus. More than half of the patients experienced thoracic pain in the substernal area or on the side of the demonstrated lesion of the lung; the pain was at times referred to the lower ribs and back. The pain in the chest generally was more of a neuralgic than of a pleuritic character and usually was not associated with respiratory difficulties.

Director of Laboratories, Texas State Department of Health (Dr. Irons) and Director of Public Health Department, Amarillo (Dr. Hooper).

[1] Irons, J. V.; Topping, N. H.; Shepard, C. C., and Cox, H. R.: Outbreak of "Q" Fever in the United States, Pub. Health Rep. **61**: 784-785, 1946.

Abnormal findings on physical examination in most instances were particularly negligible at the time of hospitalization, even though illness in some instances had been present for several days and the patients were moderately toxic, usually with moderately high fever on admission.

The respiratory rates generally were not unusual and averaged about 24 to the minute. With few exceptions the patients were without respiratory difficulty, and with only 1 or 2 exceptions there were none of the obvious symptoms of pneumonia, such as dyspnea, inspiratory-respiratory grunt or cough with typical rusty or blood-streaked sputum. Mild cyanosis was observed in 4 patients who were without evidence of respiratory difficulty. On admission the average pulse rate was 94 beats per minute and the average temperature was 101.5 F. Temperatures on admission varied from 97 to 105 F. The pulse rate, although elevated, frequently was somewhat low in proportion to the fever and did not always parallel the temperature curve. On admission the 2 cases which terminated fatally exhibited the highest temperatures and pulse rates in the series. In most instances the duration of fever was from one to two weeks.

Roentgenologic examination of the chest was the main source of evidence of pulmonary lesions. The lesions frequently were the patchy type seen in bronchopneumonia. A soft, diffuse type of infiltration, singular or multiple and usually lacking the uniform density observed in lobar pneumonia was seen on the roentgenograms. The lower lobe of the left lung perhaps was more often involved than the lower lobe of the right. More than one lobe seldom was involved. There apparently was little correlation between the severity of illness and the degree of pulmonary involvement. For the most part roentgenologists reported the films as showing atypical or beginning pneumonia or pneumonitis. Since the physical signs of lung involvement were minimal, without roentgen ray examination several patients hardly would have been seriously considered to have suffered from a pneumonic process. In view of the common complaint of pain in the chest in some degree by nonhospitalized patients, it seems certain that pulmonary or pleural involvement occurred in the great majority of cases in this outbreak.

A summary of the clinical data on hospitalized patients is shown in the accompanying table, and the roentgenologic data and the physical signs are given later in the form of brief case reports.

The rash frequently noted in other rickettsial diseases was minimal or absent. Mention was made in 2 or 3 instances of a few small spots of doubtful significance on the ankles or chest. In no instance was there pronounced jaundice. The spleen was recorded as palpable only in 1 case. Enlargement of lymph glands was not noticed in any case.

For the most part the red blood cell counts and hemoglobin determinations were within normal range. In all except 2 or 3 patients the total white cell count at the time of admission to the hospital was within normal limits. In cases in which the count was elevated as the illness progressed the count showed a decrease or no increased elevation. The differential count showed an average of more than 70 per cent neutrophils in all instances. Blood for culture was taken on one or more occasions from 4 or 5 patients. On two or three occasions a diphtheroid of no significance was encountered, otherwise the cultures were reported as bacteriologically negative. Agglutination tests, with Eberthella typhosa, Salmonella paratyphi A, Salmonella paratyphi B, Brucella abortus, Proteus OX 19 and Pasteurella tularensis as antigens, were performed on serums from 7 hospitalized and several nonhospitalized patients; the results were essentially negative.

Urinalyses were negative except for occasional transient mild albuminuria during the febrile period. Typical pneumococci were not found in sputum from 5 patients. Mice injected with sputum from 3 patients were reported negative for pneumococci. Staphylococci, streptococci and similar organisms were found.

Clinical Data on Eighteen Patients Hospitalized with Q Fever

			On Admission

R L R	3/15	3/15	103.4	100	24	7	3/22	Nausea, headache	+	—	No consolidation

* All cases listed occurred in white males.
† Temperature was normal March 27 to 29, the course of the disease was complicated by pleural effusion later.

Complement fixation tests for typhus and spotted fever also were performed on late convalescent serums from several patients. In each instance the results of the tests were essentially negative. Several late convalescent serums tested for cold agglutinins[2] of atypical pneumonia gave essentially negative results. With serums obtained in convalescence or a few weeks after recovery, complement fixation and rickettsial agglutination tests almost without exception were positive for Q fever.

The usual supportive treatment was followed with hospitalized patients. In addition the sulfonamide compounds and penicillin were employed, but it was not believed that these drugs, either alone or in combination, exerted any appreciable effect on the course of the illness. Certainly the fever did not show the prompt and decided diminution which might be expected with successful therapy of pneumonia. Para-aminobenzoic acid (PABA), which has been reported to be beneficial in the treatment of other rickettsial diseases,[3] was not tried.

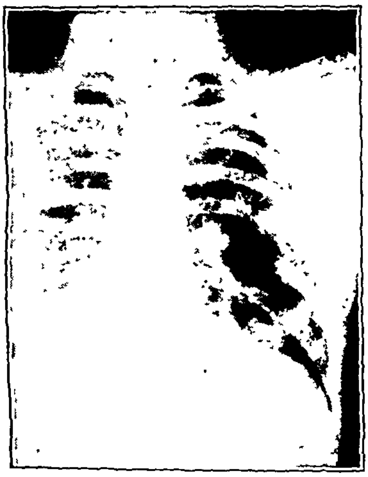

Fig. 1 (E. M.).—Small area of increased density in the lower lobe of the left lung.

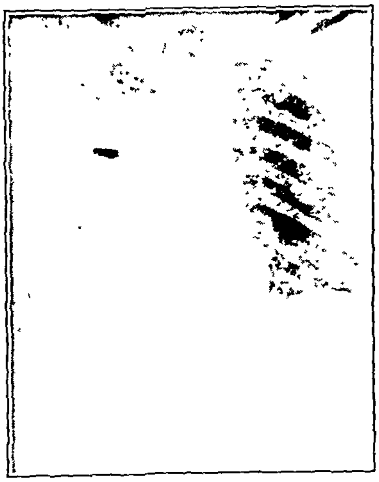

Fig. 2 (D. W. M.).—Areas of increased density involving both lobes of the left lung.

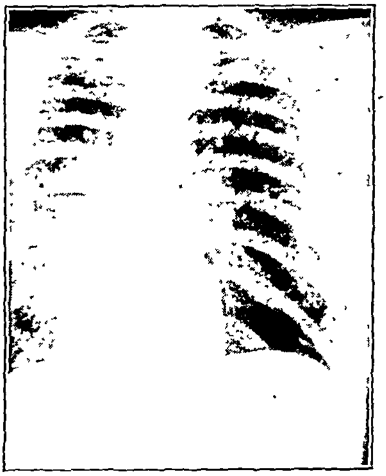

Fig. 3 (S. T .O.).—Diffuse area of opacity in the upper part of the lower lobe of the left lung.

Most patients made an uneventful recovery. In the less severe illnesses the patients were up and ready to return to work shortly after the temperature had returned to normal. In several instances of more severe infection there was a loss in weight of 15 to 20 pounds (7 to 9 Kg.). At least 3 patients still complained of slight cough and slight pain in the chest several days after their return to work. In 3 patients the illness was complicated and in 1 instance much prolonged by pleurisy and effusion. In 2 patients there was a late complaint of arthritis which involved the wrists, fingers or knees. A painful knee with some swelling developed, apparently as a late complication, in 1 otherwise relatively mild uncomplicated case. In 2 cases a well defined unilateral orchitis and slight epididymitis developed late in the course of illness. Cultures in these 2 cases were negative for Neisseria gonorrheae.

Two deaths in brothers occurred in the series. One of these cases displayed definite evidence of pneumonia. Unfortunately, autopsies were not performed in these 2 fatal cases.

REPORT OF CASES

The physical signs and roentgenologic findings of the hospitalized patients are summarized in the following case reports.

A. R. W.—Bronchovesicular breathing and increased breath sounds; rales heard. March 22, 1946—Roentgenogram: area of increased density in upper and middle lobes of the right lung. March 29—Area of increased density in the right lung had decreased. Impression: atypical pneumonia.

E. M.—Area of consolidation in lower lobe of the left lung with soft peribronchial thickening in both lungs and scattered soft spotty infiltration. March 14—Roentgenogram (fig. 1): small area of increased density, lower lobe of the left lung. Impression: atypical pneumonia.

E. B. J.—Essentially negative. March 22—Roentgenogram: pneumonitis in the lower lobe of the right lung. April 17—Breath sounds in right axilla frankly tubular; no rales. Roentgenogram shows area of increased density, lower lobe of the right lung. Impression: atypical pneumonia; probably complicated with pleural effusion.

N. H. S.—Bronchovesicular breathing; a few fine rales. March 23—Roentgenogram: peribronchial thickening in both lungs; a diffuse area of opacity, upper part of lower lobe of the left lung. Impression: atypical pneumonia.

L. M. C.—Essentially negative, except for a few fine rales. March 18—Roentgenogram: slight diffuse area of increased density, lower lobe of the left lung; possible beginning pneumonia.

A. B.—A few rales heard in both lungs. Roentgenogram: increased area of density, perhaps more pronounced in lower lobe of the left lung. Impression: primary atypical pneumonia.

D. W. M.—Patient in respiratory distress with rapid shallow breathing; many rales heard. March 19—Roentgenogram: areas of increased density involving both the upper and lower lobes of the left lung (fig. 2). Impression: pneumonia.

S. T. O.—Occasional rales and bronchovesicular breathing. March 21—Roentgenogram: diffuse area of opacity, upper part of lower lobe of the left lung (fig. 3). Impression: central pneumonia.

L. E. S.—Occasional central rales with bronchial breathing throughout. March 22—Roentgenogram: large area of increased density, lower lobe of the right lung (fig. 4). Impression: atypical pneumonia.

W. A. S.—Occasional rales; bronchial breathing throughout both lungs. March 21—Roentgenogram: large area of increased density involving almost the entire lower lobe of the left lung. Impression: atypical pneumonia.

T. E. M.—Essentially negative; no rales. March 22—Roentgenogram: no demonstrable pneumonia; slight thickening of pleura, upper lobe of the right lung (fig. 5). Impression: pleurisy.

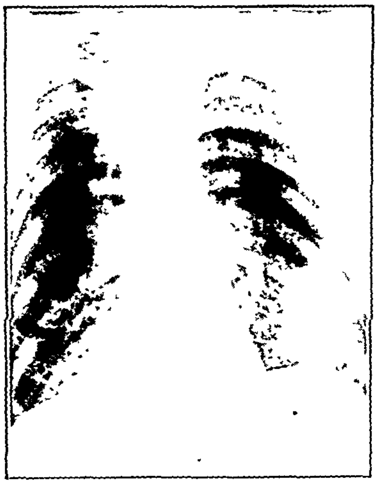

Fig. 4 (L. E. S.).—Large area of increased density in the lower lobe of the right lung.

E. L. W.—Occasional rales in right side of chest. March 27—Roentgenogram: pneumonitis in right lower lobe of lung at costophrenic angle. April 2—pneumonitis in right lower lobe of lung, with probable pleural effusion.

R. L. R.—Bronchovesicular breathing; occasional rales. Roentgenogram: no consolidation. Impression: acute bronchitis

COMMENT

The clinical features of an explosive outbreak of Q fever which occurred among stock handlers and slaughterhouse workers at Amarillo, Texas, have been described. The cases were similar except for wide variations in the severity of illness, which ranged from mild influenza-like attacks to grave illnesses with 2 deaths. The most outstanding observations were rather abrupt onset associated with frontal headache, chilly sensations and general malaise, high fever of five to fifteen days' duration, essentially normal white blood cell count, roentgenologic evidence of pulmonary lesions with minimal symptoms and physical signs referable to the respiratory tract and comparatively rapid convalescence. The cutaneous manifestations which are characteristic features of other known rickettsial diseases were not observed. Except for frequent evidence of pulmonary lesions, these cases seemed similar to those originally described in Australia by Derrick.[4] Hornibrook and Nelson[5] first called attention to evidence of pulmonary lesions in an institutional outbreak of Q fever at Washington, D. C. Roentgenologic examination showed the occurrence of pulmonary lesions in varying degrees in other recent outbreaks.[6]

In the absence of evidence of lesions of the lungs Q fever is not readily differentiated from the early stages of many acute febrile conditions such as typhoid, typhus and brucellosis. With recognition of pulmonary or pleural involvement, the problem of differentiation changes. In the Amarillo cases primary atypical pneumonia was excluded because of the acute onset, lack of symptoms referable to the upper part of the respiratory tract, comparatively rapid convalescence and lack of cold agglutinins in convalescent serums. Lack of history of contact with birds seemed to rule out the probability of psittacosis. While the clinical and epidemiologic observations were suggestive of Q fever, the diagnosis was established primarily on the basis of laboratory procedures, with particular reference to increasing complement fixation titers during convalescence and after recovery. Sulfonamide and penicillin therapy was ineffective. Para-aminobenzoic acid therapy was not tried.

The Amarillo epidemic of Q fever represents the first sizable outbreak of this disease acquired naturally in the United States. Previous reports[7] had suggested the natural occurrence of Q fever in this country. While a sizable outbreak of Q fever[6b] occurred among troops at Camp Patrick Henry, Virginia, in the spring of 1945, it was quite clear that the infections had been acquired in Italy. It is becoming increasingly clear that Q fever must require consideration in the differentiation of atypical and nonbacterial pneumonia and undiagnosed acute febrile illnesses. While the identification of Q fever is dependent on laboratory procedures, this disease should be suspected when clinical, roentgenographic or epidemiologic features of Q fever occur.

CONCLUSIONS

The clinical and roentgenographic aspects of a naturally occurring outbreak of 55 cases of Q fever is described. Eighteen hospitalized patients were studied, of whom the majority showed pulmonary lesions.

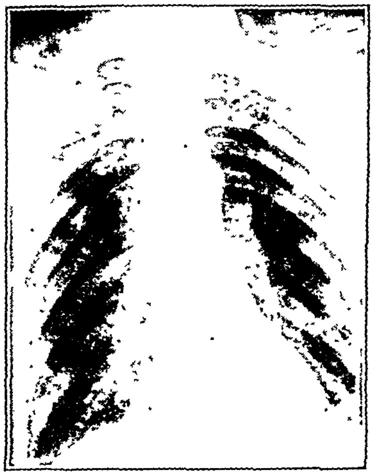

Fig. 5 (T. E. M.).—Slight thickening of pleura, upper lobe of the right lung.

The cases as a group presented a syndrome characterized by fever, headache, constitutional symptoms and minimal signs or symptoms referable to the respiratory tract.

Q FEVER IN THE UNITED STATES

III. Serologic Observations in an Outbreak Among Stock Handlers and Slaughterhouse Workers

J. V. IRONS, D.Sc.
J. N. MURPHY Jr.
Austin, Texas
and
DON M. WOLFE, Ph.D.
Pearl River, N. Y.

The preceding articles in this series cover the clinical and epidemiologic aspects of the outbreak of Q fever at Amarillo, Texas, in March 1946. The present report describes the results of complement fixation tests for Q fever obtained with serums from patients infected in this outbreak. The first significant indication that the Amarillo outbreak of illnesses was caused by the strain of rickettsia responsible for Q fever came from complement fixation tests done on convalescent serums.

Burnet and Freeman,[1] Cox [2] and Dyer, Topping and Bengtson [3] utilized direct rickettsial agglutination, while Bengtson [4] first applied the complement fixation technic using yolk sac antigen in serologic tests for Q fever. With serums obtained from patients infected in the Amarillo outbreak, a modified Kolmer, quantitative complement fixation procedure with overnight ice-box fixation was employed. The Q fever antigen [5] was prepared from a strain isolated in 1935 from Dermacentor andersoni in Montana—the American Nine Mile strain.[6] The antigen used was diluted 1:4 or 1:8. Complement was titrated in the presence of antigen, and 2 units of complement were employed in all tests. Tubes containing inactivated serum in serial dilution, antigen and complement were placed in the chillroom for about eighteen hours. The next morning the hemolytic system, consisting of 2 units of amboceptor and 2 per cent washed sheep cells, was added, and the tubes were incubated in 37 C. water bath. Tests were recorded as soon as the serum and antigen controls showed complete hemolysis. Positive and negative serum controls were included in each series of tests. Results could be duplicated without much variation in serum titers. Whenever possible serial blood samples obtained from the same person were tested simultaneously. Serologic confirmation of the diagnosis of Q fever was obtained with the majority of suspect cases, as shown in table 2.

Table 3 shows that significant complement fixation titers appeared during the second week after the onset of illness. However, in some cases the highest titers were not reached before the fourth or fifth week after the onset of illness. In most instances high titers were maintained at least for a few weeks.

The results obtained with paired serums from several patients are shown in table 1. The increased titers during convalescence and after recovery from illness are noticeable in most instances when the first bleeding was not too late. The relatively early samples of serum from patients A. R. W., N. H. S., S. T. O., E. M. H. and D. W. M. gave negative results.

The specificity of the complement fixation test for Q fever was shown by employing several of the same serums in identical tests except that endemic typhus and spotted fever antigens, respectively, were used in place of the Q fever antigen. None of the Amarillo

[4] Bengtson, I. A.: Complement-Fixation in Q Fever, Proc. Soc. Exper. Biol. & Med. **46:** 665-668, 1941.

[5] The antigen was prepared as follows: Yolk sacs from Q fever (American Nine Mile)-infected embryonated eggs that were living on the sixth day of infection were harvested and held in the frozen state in carbon dioxide snow until ready for processing. The frozen yolk sacs were thawed, weighed and diluted with an equal portion of isotonic solution of sodium chloride by weight containing 0.8 per cent solution of formaldehyde. The mixture was homogenized in a Waring blendor and allowed to inactivate overnight at 4 C.

The above suspension was diluted to a 10 per cent yolk sac content with isotonic solution of sodium chloride and ether-extracted for six hours at 4 C. with four-fifths volume of ether. The aqueous phase was recovered and further treated with a quarter volume of ether overnight at 4 C.

The aqueous phase was recovered and the excess ether removed by evacuation at room temperature. The resulting suspension was then placed

(Footnote 5 continued in next column)

in cellophane bags and concentrated to one third of its volume by perevaporation.

Such an antigen was usually found antigenic in a dilution as high as 1:32 by complement fixation methods and could be used in a dilution of 1:8 or 1:16 for subsequent testing of serums of patients suspected of having Q fever. This antigen did not give cross fixation reactions with serums from guinea pigs convalescent from infection with Rocky Mountain spotted fever, murine or epidemic typhus.

[6] Davis, G. E., and Cox, H. R.: A Filter-Passing Infectious Agent Isolated from Ticks: I. Isolation from Dermacentor Andersoni, Reactions in Animals, and Filtration Experiments, Pub. Health Rep. **53:** 2259-2267, 1938.

serums fixed complement with these antigens, although the antigens reacted in high titers with control serums from patients in known cases of typhus and spotted fever, respectively.

A control group of 14 serums collected at Amarillo in May and June, 1946 gave negative results. These serums were taken from the wives or mothers of 4 patients with Q fever, from 3 employees of a nearby packing company which apparently was not involved in the outbreak, from 4 office workers present at the time of the outbreak but presumably not exposed and from 3 butchers at the packing company who presumably were not exposed because they were employed shortly after the outbreak occurred. With one or two exceptions specimens of serum collected elsewhere gave negative results

TABLE 2—*Distribution of Cases of Q Fever at Amarillo, Texas, March 1946*

	Number of Suspect Serums Tested	Number of Serums with Diagnosis Serologically Confirmed
Packing plant	31	27
Auction company	3	3
Stockyards	21	19
Total	55	49

The occurrence of unrecognized illness or inapparent infection during the March outbreak possibly explains the titers obtained on serums from a small group of presumably exposed persons (table 4).

Mean titer . . .	<1 20	>1 80	>1 160	1 320	>1.320	>1 320

COMMENT

The complement fixation test for Q fever was utilized to good advantage in the investigation of the explosive outbreak of illnesses at Amarillo, Texas, in March 1946. From the results obtained it appears that the test is both sensitive and specific. It should be noted, however, that serums fixed complement only near the end of the acute phase of illness or in early convalescence. Our observations suggest that rising titers obtained from tests of serums taken during the first and third weeks after the onset of illness would indicate that the patient had Q fever. In this outbreak of Q fever the complement fixation test was of great assistance in retrospective diagnosis, since high titers persisted at least for a few weeks.

TABLE 4—*Q Fever Complement Fixation Titers on Serums of Persons Presumably Exposed but Not Ill*

Serum	Occupation	Titer	Date
A Ba	Stock handler	1 320	5/2/46
E. G	Sausage maker	1 640	5/2/46
J L	Tankage worker	1 40	5/2/46
D O N.	Stock handler	1 20	5/2/46
R W.	Butcher	1.160	5/2/46
L V	Deliveryman and beef cooler	1 160	5/2/46

It should be emphasized that as a laboratory diagnostic aid the use of killed antigen in serologic tests is preferable to attempts to recover and identify Rickettsia burneti because of the extreme infectiousness of this agent in the laboratory.

Derrick[7] and Cox[2] originally found that the Weil-Felix test, which is of value in the laboratory diagnosis of certain other rickettsial diseases, gives negative results in Q fever. It was noted in a preceding report[8] in this series that all serums failed to react in the Weil-Felix test.

CONCLUSIONS

With serums collected from patients infected in the Amarillo outbreak of Q fever and tested by the complement fixation method it appeared that:

1. Titers were low as a rule during the first week of illness.

2. Subsequently the titers generally reached and maintained high levels at least for a few weeks.

3. The serologic observations indicated that the illnesses were Q fever.

Q FEVER IN THE UNITED STATES

IV. Isolation and Identification of Rickettsias in an Outbreak Among Stock Handlers and Slaughterhouse Workers

HERALD R COX, D Sc.
WALTER C TESAR
Pearl River, N Y.
and
J. V. IRONS, D Sc
Austin, Texas

The preceding papers of this series deal with the clinical, epidemiologic and serologic observations concerning an outbreak of Q fever that occurred in 1946 among stock handlers and slaughterhouse workers in Amarillo, Texas. The present report deals with the isolation and identification of the causative agent, Rickettsia burneti[1] (Rickettsia diaporica,[2] Coxiella burneti[3]), from the serums of 2 patients, T. E. M.[4] and R. W.,[5] both white men employed by the Western Stock Yards and the Pinkney Packing Company, respectively.

EXPERIMENTAL

Passage in Dilute Brown Agouti (dba) Mice.—Serum samples obtained from T. E. M. and R W. during the acute phase of their illness on March 22 and 25, respectively, were diluted 1 : 10 with sterile isotonic solution of sodium chloride and inoculated in 0.5 cc. amounts into 4 mice of the dilute brown agouti strain (2 for each serum) by the intraperitoneal route. In none of the mice did there develop clinical signs of illness, nor did they show any abnormal gross pathologic condition when killed seven days later. Nevertheless, 10 per cent suspensions were prepared from their spleen

[4] In paper II of this series the case of T. E. M. is reported and illustrated (fig. 5).

[5] In paper III of this series data on R. W. appears in table 4

and brain tissues, and these were inoculated into a second series of the dilute brown agouti strain of mice by the intraperitoneal and intracerebral routes, respectively. After seven days the mice that received spleen tissue intraperitoneally were killed, and their spleens were passed by the intraperitoneal route to a third series of the same strain. Likewise, the mice that received brain tissue intracerebrally were killed and their brains passed by the intracerebral route to a third series.

Results in the Dilute Brown Agouti Strain of Mice.—The R. W. series of mice inoculated intracerebrally with brain passage material was discontinued after the third passage because none of the animals showed any signs of clinical illness or any abnormal gross pathologic conditions when they were killed on the seventh day. Furthermore, negative Q fever[6] complement fixation results were obtained with serum samples derived from the third passage mice just prior to their being killed. The Q fever antigen employed was prepared from a strain isolated in 1935 from Dermacentor andersoni in Montana—American Nine Mile strain.[6]

The R. W. series of mice inoculated intraperitoneally with spleen suspension showed greatly enlarged spleens, similar to those reported for Q fever in mice[6] in both the second and third passages. Rickettsial organisms identical to those described for Q fever[7] were also found in impression slides prepared from the third series mouse spleens stained by Machiavello's method.[8] Furthermore, serum derived from one of the third passage mice gave a positive (4 plus) Q fever complement fixation reaction in a 1:40 dilution (end point not determined).

The T. E. M. series of mice inoculated intracerebrally with brain passage material showed no gross or clinical evidence of Q fever infection until the third transfer, whereupon 1 of the mice showed a typically enlarged spleen. Typical rickettsia-like organisms were readily found in Machiavello-stained impression smears of the spleen, and the serum of this mouse gave a positive (4 plus) Q fever complement fixation reaction in a 1:40 dilution (end point again not determined).

The T. E. M. series of mice inoculated intraperitoneally with spleen suspension showed decidedly enlarged spleens in all three serial passages, beginning with the first transfer. Similarly, typical rickettsial organisms were found in impression slides prepared from spleen tissues of the third transfer.

Passage in Albino Swiss Mice and Guinea Pigs.—Five virus transfers were established from the previously described dilute brown agouti strain of mice to both albino Swiss mice and to guinea pigs. Two transfers were of the R. W. strain, using liver and spleen tissues, respectively, of the third intraperitoneal dilute brown agouti passage. The remaining three transfers were of the T. E. M. strain, these being a liver and spleen tissue passage, respectively, of the second intraperitoneal dilute brown agouti series and a liver tissue transfer of the third intraperitoneal dilute brown agouti series. The infection thus established has been readily maintained in Swiss mice by making transfers with spleen tissue injected intraperitoneally and in guinea pigs by passing blood or spleen tissue intraperitoneally or subcutaneously.

Results in Albino Swiss Mice and Guinea Pigs.—The gross pathology of the infection in Swiss mice and in guinea pigs is identical in all respects with that previously described for American Q fever in these animals.[6] Likewise typical rickettsias[7b] may be readily demonstrated in the spleen tissue of mice and guinea pigs as well as in the inflammatory exudate of the skin of guinea pigs injected by the subcutaneous route. In addition, the serums of guinea pigs convalescent from infection with either the R. W. or T. E. M. strain give positive complement fixation with Q fever antigen in dilutions as high as 1:2,048.

Cultivation in Developing Chick Embryos.—Both the R. W. and T. E. M. strains have been readily cultivated in series in the yolk sac tissue of the developing chick embryo.[9] The growth and staining properties are characteristic of those described for Q fever.[10]

COMMENT

A rickettsial agent apparently identical in all criteria to R. burneti, the causative agent of Q fever, was isolated from the serums of 2 naturally infected human subjects. The literature indicates that the guinea pig generally has been used for isolating R. burneti from human blood.[11] The work reported herein shows that the dilute brown agouti strain of mouse may be employed in place of the guinea pig with satisfactory results. This strain of mouse has been found to be of value in studies with murine typhus,[12] dengue fever,[13] Lymphogranuloma venereum[14] and Colorado tick fever.[15]

The recovery of Q fever rickettsias from 2 of the patients substantiates the epidemiologic, clinical and serologic observations made on the Amarillo epidemic.

SUMMARY

The isolation and identification of strains of Q fever from the serums of 2 naturally infected human subjects is described. The recovery of Rickettsia burneti in these cases substantiates the observations reported in the preceding papers of this series.

THE KNOWLEDGE OF HUMAN VIRUS INFECTIONS OF ANIMAL ORIGIN

K. F. MEYER, M.D., Ph.D.
and
B. EDDIE, Dr.P.H.
San Francisco

Present day information on the viral agents is in a state of flux; changes in fact and in point of view occur in kaleidoscopic fashion, and there is considerable hesitancy to make final conclusions. Although numerous papers have been published, they are scattered throughout scientific journals and are not always readily accessible to the clinician. A brief summary of the knowledge of virus diseases having their origin in the animal kingdom therefore seems warranted. From the increasing number of diseases which belong to this group, rabies, psittacosis and arthropod-borne encephalitides were selected for presentation in this paper because of the peculiar action of the respective inciting agents on children.

RABIES

That rabies is a major public health problem is evidenced by the continuing demand for information and advice concerning its diagnosis and postinfectional treatment with vaccine as well as the planning of effective rabies-control programs. The knowledge that rabies is invariably fatal once it has developed makes it one of the most feared and notorious of diseases.

The usual mode of transmission from the rabid animal is by means of a bite, the resultant wound being contaminated with infected saliva during the act of biting. However, many consultations on the necessity of rabies treatment for human beings mention the occurrence of a scratch on the bare skin rather than a bite. Several authentic cases are recorded of rabies which developed after the hands had been licked by an infected animal. Babès and Vesilu,[1] in their experiments, failed to cause infection when street virus was rubbed into superficially produced scratches on human subjects. Pawan [2] found the saliva of bovines, horses and human beings suffering from paralytic rabies highly infectious to rabbits. He also comments that although a large number of persons have scooped up saliva from the mouth of rabid animals with their hands, on which superficial wounds could be seen, no one had contracted rabies through this practice.

It occasionally happens that a number of dairy patrons who are enthusiasts for raw milk consume that from a cow subsequently proved to have suffered from rabies. The pertinent question then arises: Should the persons who have ingested the milk be subjected to antirabic treatment? A careful perusal of available literature fails to uncover a single case of human rabies conclusively proved to have followed the ingestion of milk from a rabid cow or other animal. Experimental studies, furthermore, conclude that the milk of rabid animals contains the virus only when the glandular structures have been torn through mechanical injuries and a means of entry provided for the disease.

PREVENTION OF HUMAN RABIES

If rabies is to be prevented in man following exposure, it is imperative to achieve an immunity sufficient to stop the multiplication of the virus in the nervous system.

Every biting dog or cat must be suspected of having rabies in an afflicted community. Each ensuing wound must be thoroughly cleansed with soap and water. When, in consultation with the veterinarian, the physician feels that a particular animal which has bitten a person has probably been or is now rabid, local treatment of the patient must be carried out by the physician. This must be done in order to inactivate any virus which may have been deposited with the saliva. Deep puncture wounds must be surgically exposed, and irrigation with a 20 per cent solution of medicinal soft soap, as recommended by Shaughnessy and Zichis,[3] instituted. Nitric acid, although an accepted chemical in the cauterization of bite wounds inflicted by rabid dogs, has proved impractical in caring for lacerations of the face.

The sanitary code of every modern health department contains provisions for the disposal of unowned, vicious and rabid dogs and for the confinement of animals to prevent the spread of rabies. No effort should be spared by the local health authorities to apprehend alive the dog that has bitten a person; it must be held under observation in a properly constructed kennel for a period of not less than two to three weeks. Even if the dog appears to have contracted rabies it should not be killed, since it is often impossible to demonstrate the characteristic Negri bodies in the brain of an animal prematurely killed in the early stages of the infection. If during the observation period the dog fails to show symptoms or to die, it is obviously unnecessary to begin vaccine treatment.

The physician is, as a rule, confronted by the problem of estimating the possibility of infection occurring in a bite victim; he must at the same time decide on the necessity for prophylactic treatment: two difficult decisions. Local treatment cannot be fully depended on, and since it takes several weeks for rabies to develop in man, the physician will decide to administer postinfectional vaccination as a safeguard.

It is well known that in rare instances the administration of rabies vaccine has resulted in a postpasteurian paralysis. The precise cause of this "treatment paralysis" is not known; it may be an allergic reaction to the nerve tissue protein injected. The number of these paralytic accidents or myelitides as a postvaccinal complication has greatly diminished since the introduction of the Semple vaccine. Piringer,[4] in a recent paper, reported that of 1,249 patients treated only 1, or 0.07 per cent, had developed postpasteurian myelitis. Experimental studies have shown that the subcutaneous injection of immune serum soon after the intramuscular injection of the virus does prevent the development of the disease in a significantly high percentage of infected mice. This type of treatment has not yet been subjected to clinical trial on mar

CONTROL OF RABIES

The Subcommittee on Rabies of the Committee on Animal Health, National Research Council, in a recent report (1945) has urged concerted action for the control of rabies. The report states that: "Rabies has gradually become more and more prevalent in the United States, because of the lack of a uniform policy and concerted action in combating the disease." The two procedures considered most efficacious—restraint and quarantine—have proved valuable in eliminating rabies from many communities, only to have the disease recur. It has therefore been recommended that a rabies control program be developed and coordinated on a nationwide scale either by the Bureau of Animal Industry, United States Department of Agriculture, or the United States Public Health Service.

Coordination is essential, since no quarantine control program can function effectually without a constantly alert dog pound and a staff of veterinary personnel adequate to supervise the impounding and effect the elimination of stray dogs. The licensing and taxation of dogs will provide the funds necessary to carry out the provisions of an enforcement act.

Preinfectional antirabic vaccination of dogs, when combined with other dog-control provisions, appears to be the most satisfactory method of assuring prompt recession of rabies. Now available are vaccines of superior potency, which can confer a high degree of immunity in a single subcutaneous injection of 5 cc. To promote public cooperation, vaccination of dogs should be performed free of charge A voluntary program of canine vaccination in Massachusetts has freed that area from the disease for the first time since its introduction there in the eighteenth century. Alabama's experience with the program was similarly gratifying.

Annual vaccination of dogs is advisable until rabies has been eliminated from every state in the Union. While the disease prevails in a community it is important to recommend to the owners of cats that their pets be vaccinated by the three injection method. The bite of a rabid cat is frequently more dangerous than that of an infected dog

Cooperation of the public is essential To this end, an educational program which has the fullest support of the medical profession, and particularly the family physician, is urgently needed if the national control of rabies is to be successfully launched and the disease eventually vanquished.

PSITTACOSIS

Numerous clinical and etiologic studies have in recent years focused attention on those acute infectious pulmonary diseases which, for want of a better name, have been called "atypical pneumonias." Any pneumonia proved to be neither bacterial nor nonbacterial uninfluenced by sulfonamide compounds and which fails to conform clinically to lobar pneumonia is diagnosed as "viral or virus pneumonia."

As investigation of the nature of the viral pneumonias progressed, it soon became evident that the clinical-pathologic entity of a pneumonitis could have a diverse etiology. As observations of the heterogeneous causation of the disease multiplied, it became imperative to establish, whenever possible, an etiologic diagnosis. This problem was solved with the aid of new virus technic; the complement fixation test was particularly helpful. These new research technics revealed that the sporadic and localized outbreaks of pneumonitis which were noted in certain sections of the country were caused by infection with strains of a virus belonging to the psittacosis-ornithosis group

Psittacosis, once an obscure and rare disease thought to be contracted only by persons associated with parrots, attracted some attention in 1929 and 1930 when importations encouraged by panicky South American parrot dealers resulted in pandemic dispersal of the disease to twelve different countries.[5] The dealers, on learning of several deaths among the members of a theatrical troupe which used a parrot on the stage, had quickly disposed of their birds with the foregoing results.

The wide distribution of psittacosis-like infections throughout the animal kingdom has been established. Since 1931, one member after another has been indicted: latent infections were found in the parakeet-breeding establishments of the United States, Canada and European countries (see Meyer, 1942); the psittacine birds in Australia (Burnet[6]); the fulmar petrels of the Faroe Islands and Iceland (Haagen and Mauer,[7] 1939, and Bedson,[8] 1940); and in the wild and caged pigeon population of the United States (Meyer, Eddie and Yanamura,[9] 1942, and Smadel[10]), Great Britain (Andrewes and Mills,[11] 1943), and South Africa (Cole,[12] 1940). Canaries, finches,[13] chickens,[14] sea gulls and Peking ducks were also found to be infected (Eddie and Meyer[15]).

The virus parasitism of spontaneous psittacosis infection in birds is characterized at first by viremia in the young. Latent localization of the infection in the spleen, liver and kidney in the later stage leads to elimination of the infective agent in the fecal discharges over a prolonged period Inhalation of desiccated bird droppings dispersed by aerial convection from cages, lofts and feathers constitutes the principal mode of transmission from birds to man

Viral agents morphologically similar to the viruses of psittacosis have in recent years been isolated from the respiratory tracts of laboratory mice (Nigg,[16] Karr,[17] Hilleman and others[18]), ferrets,[19] cats and kittens (Baker,[20] 1942) and human beings who were supposed to have had no contact with birds or mammals (Eaton, Becks and Pearson,[21] 1941; Louisiana outbreak,[22] 1945). The ecology of these viruses remains an enigma, although it is suspected that the feline pneumonitis agent can be transmitted to man. It is of interest to note that no proved infections due to contact with laboratory mice are on record; in fact, the assumed risk of handling large breeding colonies of infected animals has not resulted in a single human psittacosis infection (Meyer and Eddie [15]).

The massive discharge of virus, a condition which might be expected from the known pathology of the disease (localization in focal lesions of the respiratory tract, without a productive cough) seldom occurs. There is convincing evidence, however, that a patient who is fatally ill with psittacosis contracted from an avian source will eliminate virus in large amounts and thus could initiate in the hospital the human to human transfer of psittacosis. Several reports of such incidents have been recorded; the consequences were disastrous (Meyer,[5] 1942, and Olson and Treuting,[22] 1944). It is imperative, therefore, that the physician remember that the occupational hazard to himself and to the attending nurses is considerable. Every human case of severe pneumonitis should be held in strictest isolation and should not be examined or treated without the protection of a face mask.

Despite these incidents, there is thus far no suggestion that a humanized strain of the psittacosis group of viruses has developed. It is noteworthy, in fact, that several cases of psittacosis or ornithosis originally reported with the accompanying statement "no contact with birds" upon careful epidemiologic search were found to have been connected with an unsuspected avian source. It requires little imagination and foresight to visualize the possible future development of various new sources and pathways of psittacosis infection, since it is now proved that the virus may be harbored in the intestinal tracts of chickens and ducks. The host range of psittacosis is today much more extensive than any one imagined it to be ten years ago. The significant fact is that contact with birds of the parrot or pigeon family is no longer an essential forerunner to the suspicion that a patient's illness is psittacosis or ornithosis.

In regard to the possible future direction of the disease from a biologic point of view, one must agree with Burnet [23] and Smadel's [10] theory that the potentiality of an independently spreading human infection does exist. It appears highly desirable to search for such a humanized strain. Ever since Gerlach's [24] demonstration of virus in the sputum of 4 patients who lacked the clinical symptoms of psittacosis the problem of the human virus carrier has possessed both practical and theoretic interest.

A résumé of circumstances which led to the discovery of a human being who had apparently remained a convalescent carrier of the psittacosis virus for eight years is as follows:

In 1938, A. M., a 36 year old biochemist, contracted a severe psittacosis infection while working in a room which contained a centrifuge where virus studies were in progress. Early in the course of the infection virus was demonstrated in the blood (on the second and sixth days) and in the sputum (on the third and sixth days). His convalescence was slow. A productive cough persisted, but a filtered sample of sputum proved noninfective. Annual reexamination of the blood serum invariably yielded a positive psittacosis complement fixation in titers varying from 1:128 to 1:256. A persistently high complement fixation titer with a psittacosis-lymphogranuloma agent as antigen furnishes strong presumptive evidence of the survival of virus in a recovered patient. In the eight years after his initial infection the virus was repeatedly isolated from a twenty-four hour specimen of sputum before and after treatment with penicillin.

A. M. was for five years in close daily contact with 20 to 30 susceptible persons; 8 of his associates were constantly exposed to the aerial droplet nuclei of his coughing spells, without consequence. Five infections resulting from continuous work with viruses of the psittacosis group did develop during the period that A. M. was away, serving with the Armed Forces. It is therefore reasonable to conclude that his contagiousness as a psittacosis carrier is, in the light of recent laboratory findings, of a low order. A comparative study of the strains isolated from the carrier will be published in the near future. There is little or no convincing evidence that the strain acquired new properties.

DIAGNOSIS OF PSITTACOSIS IN CHILDREN

The observations which follow especially deserve the interest of the pediatrician. The laboratories at the Hooper Foundation have from time to time during the past five years been called on to aid in the diagnosis of cases of pneumonitis. Many thousands of serum specimens have been submitted for use in making complement fixation tests in the presence of the psittacosis antigen. Tentative classification of case histories and serologic data records a total of 228 psittacosis cases with 21 deaths, or a mortality rate of 9.3 per cent for the five year period. The exact nature of the infection was proved in 52 cases (22 per cent) when the virus was isolated from the sputum or from the organs at autopsy. The infections were definitely linked with exposure to birds in 219 histories, nearly one half of them after contact with psittacine species. Over 80 infections were connected with pigeons, while ducks, canaries, chickens and even grouse were also suspected as sources. The importance of infected parakeets and parrots as vectors cannot be overestimated; despite the various repeated attempts to control this source of psittacosis, it remains a prime infectional fount.

In performing laboratory diagnoses of submitted pneumonitis cases, samples of patients' serums were studied for antibodies against the psittacosis virus by a routine technic previously described.[25] Because of its close antigenic relationship to the psittacosis virus, the commercial antigenic form of the lymphogranuloma virus has been included in these routine tests during the past two years. It has been amply demonstrated that the coreactions of psittacosis virus with this particular preparation are irregular. The true etiologic nature of the pneumonitis would have been missed had the lymphogranuloma antigen been used as the sole reagent for detecting antibodies in the serums of patients. Even the concentrated and properly standardized lymphogranuloma antigen failed to give complement fixation reactions when serums derived from patients with bacteriologically proved psittacosis or ornithosis were used.

Unfortunately, the clinical histories furnished by physicians were frequently incomplete; only in 111 cases were ages listed. Persons of middle age and juveniles were involved but *no* children in the age group 1 to 9 years. This is not surprising, since previous experience had indicated that even if children of this youthful group were intimately exposed to the same birds which had infected their parents or older relatives, clinical infections had rarely resulted. Of the 160 psittacosis infected patients of known age in Germany, only 2 were under 10 years of age. These statistics are based on household infections in which clinical similarity rather than serologic or etiologic evidence had decided the diagnosis.

The age group 10 to 19 is known to be susceptible to a mild form of psittacosis. Since 15 of the 111 histories refer to psittacosis infections in this age group, it would perhaps be of interest to analyze the motivating evidence which led to the submission of specimens of serum for examination. The accompanying table may be of assistance to pediatricians.

Close cooperation between the virus diagnostic laboratory and the clinician is vital. The serologic tests which had been requested by the physician furnished no conclusive evidence that the pneumonitis afflicting the 15 children was etiologically connected with a virus of the psittacosis group. The existence of latent infections was, however, indicated. Study of the case histories of the children only served to emphasize the difficulties often encountered in attempting to establish

proof of recent infection with a virus of the psittacosis group. Particularly in children who are liable to subclinical infections, the demonstration of complement-fixing antibodies capable of reacting with psittacosis antigens in a single sample of convalescent serum must be considered inadequate. The mere demonstration of antibodies which have evidently persisted in the blood serum over a long period of time constitutes proof which is inadequate to justify the unreserved linking of pneumonitis with a psittacosis viral agent. It is imperative that in the future at least two criteria be adopted in the diagnosis of psittacosis: (1) isolation of the virus from the blood or sputum during the acute phase of the disease and (2) the demonstration of a significant rise in titer in complement-fixing antibodies. Blood collections taken during the acute phase of the disease may be of diagnostic assistance if used in making animal inoculations and serologic tests. Certainly, no effort should be spared in the attempt to isolate the virus. Modern technics which destroy concomitant bacteria encourage the use of nasal or throat washings, should the nonproductive cough fail to yield suitable specimens. Again, vomitus or gastric lavage specimens may be successfully injected into mice and examined for virus. In their present form, procedures for the isolation of virus are time-consuming and consequently furnish an etiologic diagnosis in retrospect. Repeated examination of serum samples collected during the first week of illness for complement-fixing antibodies may supply suggestive information. A twofold to fourfold increase in titer, for example from 1 : 2 to 1 : 8 ++++, together with objective signs of a pulmonary involvement warrants an early tentative diagnosis of psittacosis and the prompt institution of specific therapy.

TREATMENT OF PSITTACOSIS INFECTIONS WITH PENICILLIN

Heilman and Herrell[26] have produced evidence that mental psittacosis in the mouse responds to treat- ith penicillin. The results obtained by Parker efendorf[27] in testing the effect of the antibiotic ne multiplication of meningoencephalitis virus were not nearly so impressive as those obtained by Heilman and Herrell and still more recently by Bedson and May.[28] The workers at the Hooper Foundation, treating experimentally infected mice and ricebirds as well as spontaneously infected pigeons, have obtained encouraging results. The outcome was convincing in mice, provided treatment of the nasally infected animals was instituted early in the course of the infection and the antibiotic was used in large doses. Six ricebirds recovered from the infection under penicillin treatment, after having received 6,000,000 units intramuscularly and subcutaneously injected over a period of seventeen days. One ricebird died from psittacosis within twenty-two days and another within twenty-seven days, while the remaining 4 were proved to be carriers when they were killed on the fifty-ninth day after the completion of the treatment. The treatment of the spontaneously infected pigeons was complicated by a secondary invasion of Salmonella typhi murium, and definite evidence of the curative value of penicillin could not in this instance be secured.

Successful treatment of human psittacosis or ornithosis infection with penicillin has been reported by Turgasen,[29] Flippin, Gaydosh and Fittipoldi,[30] and has been communicated to us by others. An opportunity was afforded at the Hooper Foundation to conduct, under careful supervision, the penicillin treatment of 3 infections incurred in the laboratory. The psittacosis virus was demonstrated in the blood of the 3 victims and in the sputum of 1. One of the cases studied is that of patient D. W. Therapy was instituted on the sixth day of this patient's illness. She became afebrile after the initial administration on that day of 80,000 units of penicillin, followed during the next twenty-four hours by 160,000 units. Treatment was continued for six days on the large dosage, was reduced for one day to 110,000 units and finally reduced for two days to 80,000 units.

In patient M. H., more severely infected, treatment commenced on the tenth day of the disease and showed symptomatic and clinical improvement forty-eight hours later, following the administration on the first day of 220,000 and on the second day of 320,000 units of penicillin. On the third day after therapy had started the patient became afebrile and remained so. The dosage, though gradually decreased, was continued for ten days. The immunity response, as expressed in the rise of complement-fixing antibodies, was prompt. It seems worth while to state that at the end of ten months the titers of both patients dropped to 1 : 8 ++++. This definite decline in complement-fixing antibodies justifies the conclusion that the tissues had been largely freed of the viral agent. Whether this result was brought about by the antibiotic or by the immunity mechanism of the patients remains a matter of conjecture. It should be emphasized at this point that mice infected with psittacosis viral agents and successfully treated with penicillin are immune and become carriers (Heilman and Herrell, Bedson and May and Eddie and Meyer).

These observations suggest that when the virus is inside the cells it is protected against penicillin and that only in the extracellular phase, when it is not actually multiplying, is the disease agent apparently susceptible to the antibiotic. The action which takes place is bacteriolytic as well as bacteriostatic. The ultimate destruction of the surviving phagocytized psittacosis viral agent depends on the enzyme action of the parasitized cells, i. e., the immunity mechanism of the host. Early damage to the mechanism in mice renders their recovery from experimental psittacosis relatively difficult. The infection progresses slowly in the ricebird, and consequently penicillin therapy is effective. However, since the immunity mechanism develops slowly treatment must be prolonged for several weeks in order to prevent relapses.

Serious relapses have in several instances resulted from the inadequate treatment of human psittacosis infections. Small doses of penicillin continued for only two or three days after the patient has become afebrile have been found to be ineffective. The dynamic action of penicillin on the psittacosis virus specifies a high dosage level administered in rapid succession early in the course of the infection in order to cut the number of vital elements to a low level and permit the normal defense mechanism of the body to dispose of the few stragglers. Adherence to these principles will greatly reduce the now unduly high human case fatality rate from psittacosis and will prevent the future development of virus carriers.

ARTHROPOD-BORNE VIRUS TYPES OF ENCEPHALITIS

Shortly after the virus of Western equine encephalomyelitis was isolated from the brain of horses,[31] human infections were noted in persons who worked in close association with infected animals.[32] Conclusive proof of this was not forthcoming until 1938 when Howitt [33] in California and Fothergill, Dingle, Farber and Connerley [34] and Webster and Wright,[35] all working in Massachusetts, isolated the viruses of equine encephalomyelitis from the brain tissues of patients in fatal cases. Since then the Manitoba (Canada),[36] Minnesota and Dakota epidemics of 1940, and the annual outbreaks in the Yakima Valley [37] and in Kern and Fresno counties in California,[38] have attested to the ever increasing importance of this disease.

Surveys taken in many other regions, using neutralization tests on blood serum specimens, have demonstrated the existence there of previously unrecognized infections.[39] These studies disclosed the important fact that the virus of the St. Louis type of encephalitis was frequently active in the same areas. The significance of these observations became clear when Hammon and his associates [40] demonstrated the existence of the virus of both Western equine encephalomyelitis and St. Louis encephalitis in the Culex tarsalis mosquito of the endemic territories. The prevalence of these infections during the season of high temperature in areas subject to agricultural irrigation and periodic flooding of streams—both procedures conducive to extensive breeding of the mosquito—is thus readily explainable. Additional investigations by the same workers have given credence to the possibility that in certain regions fowls, and perhaps other birds, serve as virus-infective sources for mosquitoes. It is important to realize that contact with horses is without consequence to man and that mosquitoes in all probability acquire the viral agent by feeding on birds with subclinical virus infections.

Clinically and epidemiologically the equine and St. Louis types of encephalitis have a great deal in common. In fact, an accurate etiologic diagnosis cannot be made without laboratory aids. Furthermore, in regions where seasonal epidemics of poliomyelitis and encephalitis simultaneously make their appearance, the differential diagnosis of apparent virus infections of the central nervous system requires constant consultation with the laboratory. Nearly 50 per cent of the cases defy differential etiologic diagnosis, even with the best possible cooperation.

Experience [41] has taught that in the majority of the endemic areas the morbidity due to Western and Eastern equine virus is highest in children under 5 years of age. The problem of the arthropod-borne encephalitides thus enters the field of pediatrics.

The actual incidence of these infections is not definitely known, but data available from the annual encephalitis epidemics in Yakima Valley, Washington, reveal between 26 and 58 accurately diagnosed cases, while in Kern County, California, the number is estimated to be as high as 150; in Fresno county it approaches 100. Fatality rates for both infections vary between 3 and 22 per cent. They are particularly high in the age groups below 2 and above 50. In infants the sudden onset of fever followed by vomiting, twitching, strabismus, stiff neck, convulsions and cyanosis characterizes the clinical picture. Proper treatment may bring about complete recovery within a few days, or death may occur within forty-eight hours after onset. Permanent residual cerebral damage with blindness and epileptiform seizures is not uncommon in infants under 6 months of age.

The course of the disease is variable but destructive in children over 3 years of age. Encephalitic syndromes such as fever, headache, slow mental and motor response, aphasia and tremors, are common in the severe type. The observations with respect to the cellular elements in the spinal fluid may be similar to those of poliomyelitis. A final and specific etiologic diagnosis is usually made by serologic tests. The neutralization test is customarily used, but it is hoped that a complement fixation test may in time prove useful, since results may be obtained rapidly even in specimens of blood serum which have been carelessly collected and poorly handled. Convalescence from the disease is

usually prolonged, though residual manifestations are less frequent in the latter group of children than in infants.

Demonstration of the viral antibodies in a single sample of convalescent serum was formerly considered adequate for diagnosis. Evidence of this nature is no longer considered to be conclusive. Since antibodies to the St. Louis or equine encephalitis virus have been demonstrated in a large percentage of the normal population in regions where the infections are endemic, it is imperative that two specimens be made available in order to detect any significant rise in the antibody titer which may take place during the time elapsing from the onset of the acute phase of the disease to the end of the convalescent period. The virus has in rare instances been isolated from the spinal fluid or blood. It is more frequently demonstrated in the brain tissues of patients surviving for six days or more after the onset of their illness.

While treatment of the encephalitides must be entirely symptomatic, the prevention of the equine type in susceptible persons may be accomplished through the use of a vaccine produced from virus propagated in a developing chick embryo. This vaccine consists of a fine suspension of virus-bearing chick embryo tissue inactivated by solution of formaldehyde. Since there is no cross protection between the different types of encephalitis vaccines, it is necessary to produce vaccines for each type of virus. Unfortunately, no vaccines are at present available for human use.

There is seldom valid reason to recommend the vaccination of the entire group of most susceptible human beings in a community against encephalitis. The use of modern mosquito control procedures, at least in the United States, should afford better protection against all the arthropod-borne neurotropic virus infections than can specific vaccination against one particular virus. Methods of control for the principal mosquito vectors are now the subject of an intensive study being carried on by the California State Department of Public Health under a grant from the state legislature. A program of this kind must be twofold, embracing both fact finding and direct field control by experiment.

In the three types of infection discussed briefly in this paper, vector control constitutes the most effective weapon which can be forged to prevent the injuries induced by accidental aberrant parasites. Further research in this field can help to conquer the element of chance in one phase of human life.

University of California Medical Center, San Francisco 22.

ABSTRACT OF DISCUSSION

Dr. Robert F. Korns, Albany, N. Y.: I would like to congratulate Dr. Meyer and Miss Eddie on this enlightened review of the subject, particularly the new information on psittacosis, that gives a little more insight into the epidemiology of this disease. My purpose is to give you the experience accumulated in New York state on two of these diseases: namely rabies and psittacosis. The arthropod borne encephalitis has never been identified there. With respect to rabies, I agree with everything that Dr. Meyer has said on the subject and can confirm the immense increase in rabies as exemplified in New York state. Last year there were close to 700 cases reported. It is hoped that the situation will be improved. A mass dog immunization program has been embarked on. Thus far, there has not been accumulated enough information to offer a conclusive answer on the question of the value of this procedure, but it has been helped by a change in the state law last year which allowed the Commissioner of Health to designate areas in which rabies existed where vaccinated dogs would be allowed at large; the Commissioner felt that dogs could be allowed at large that have been adequately vaccinated. Many New York counties have embarked on this dog vaccination program on a voluntary basis and, to date, eight of them have completed such programs, vaccinating over 90 per cent of the dogs enumerated in the counties on an entirely voluntary basis. Preliminary analysis indicates that the attack rate in vaccinated dogs worked out on the basis of dog months and exposure to rabies in a community where it exists and dealing only with licensed dogs to avoid the difficulty with the stray animals and underenumeration, the attack rate in vaccinated dogs has been calculated as 4.5 per 100,000 dog months of exposure. When this is done for the nonvaccinated dog population in the same areas, a figure of 23.6 per 100,000 dog months of exposure is arrived at, roughly five times as great. Again, these figures are tentative. I don't want to imply that the vaccination of dogs is the whole story, but it is to my mind very worth while. I wish to comment also on the psittacosis group. We have been jointly concerned with several investigations in New York state, and one study in particular furnishes some new information. Dr. Meyer mentioned the occurrence of the disease in ducks. This had not been previously reported and I want to tell you of the occurrence of the disease in Long Island during the past year. About April 1945 Dr. William Wolins in Riverhead had a case of an atypical pneumonia which puzzled him, and he thought that it might be psittacosis. He sent serums to Dr. Meyer, by whom the diagnosis was confirmed. Later, search was made for additional cases and the interesting observation was that the carrier was a duck handler. Long Island is famous for ducks. There are 7 million ducks coming out of that island annually. A search revealed about 19 cases of atypical pneumonia having the same clinical picture, rather mild for the most part, in duck handlers. Only 10 of these demonstrated serologic evidence of psittacosis. The epidemiologic evidence implicated duck handlers since in only 2 of these cases the patients did not have intimate contact with ducks. Furthermore, serologic survey of duck handlers versus nonduck handlers showed the contradiction there. Of over 100 ducks examined by Dr. Meyer and Miss Eddie, 34 per cent of them have shown a virus of the psittacosis group. Furthermore, 3 of 7 sea gulls showed the virus. Evidently the disease has been existing in ducks in Long Island for many years and has only recently been discovered.

Dr. Gilbert J. Levy, Memphis, Tenn.: Dr. Meyer, what is the longest incubation period of rabies in man? I had a patient, a child, who had been bitten two years previously by a rabid cat. Is this possible?

Dr. Karl F. Meyer, San Francisco: I would like to answer this question. According to my personal observation the longest incubation time in rabies was three hundred and sixty-seven days. The particular person had been bitten by a rabid cat unknown to her. She spent a vacation in one of the summer resorts and came down with a bizarre disease which later was identified at autopsy as rabies. I am sorry that Dr. Korns from New York had to smear his own state with duck psittacosis. I would like to remove that stigma and say that we have it in California as well. A study has just been completed in which it was shown that 3 of 11 ducks obtained from the chicken town, Petaluma, contained the psittacosis virus. I don't want to create now a great deal of fear that you shouldn't eat any ducks. You probably have done it a great many times and have never contracted psittacosis, but it is worth while to keep in mind that this new reservoir of psittacosis is enormous. There are indications that children playing with ducks contract mild infections from this source.

CHOICE OF ANESTHESIA IN ORTHOPEDIC SURGERY

CAPTAIN JOHN B. DILLON
Medical Corps, Army of the United States

There are no surgical patients who present more diverse conditions than those met by the orthopedist, and there are few patients who present greater problems to the anesthetist.

The day has passed when it can be said that one or two anesthetic procedures will cover all cases. The development of special surgical technics not only necessitates the development of special anesthetic technics but depends on their development.

The anesthetist has a dual responsibility. First, he has an obligation to the patient to see to it that the patient suffers no damage or at least minimal damage from the anesthesia and if possible that the patient is in better physical condition than he was prior to entering the operating room. Second, he has an obligation to the surgeon, namely, to provide the type of anesthesia that will enable the surgeon to accomplish the procedure at hand with no added difficulty. Ideally, the surgeon should be able to request an anesthetic and then forget that problem entirely. Unfortunately this ideal situation now exists in relatively few localities, but it will spread as the importance of anesthesia in the order of surgical technics is realized and more men are attracted to it as a specialty.

It is not possible categorically to state that certain anesthetic procedures are better than others for certain orthopedic problems. The anesthetic of choice depends on many factors. The age, the physical and psychologic condition of the patient, the condition to be corrected, the facilities, the explosion hazards and the local custom must all be taken into consideration.

Proper preoperative care is many times more important than the use of any particular anesthetic agent.

It should be thoroughly established before an anesthetic is administered that the patient is not in shock or, if shock is present and an anesthetic must be administered (a condition rarely justifiable), that active measures have already been taken to overcome the shock.

It should be determined that the patient has not eaten or taken a quantity of fluid within six hours before inhalation anesthesia is started. If either has been ingested the stomach should be emptied prior to anesthesia, for it will empty during either induction or emergence, and this is a source of many anesthetic complications.

Preoperative medication is of major importance for all patients who are to receive an anesthetic. The basis of a smooth anesthetic rests on the adequacy of premedication, and either insufficient or excessive dosage can greatly complicate the procedure. The drugs and dosages used vary with the age, weight, psychic state and metabolic peculiarities of the patients. I do not ordinarily use a narcotic for patients under 12 years of age. For these patients $\frac{1}{2}$ to $1\frac{1}{2}$ grains (0.03 to 0.1 Gm.) of seconal sodium with from $\frac{1}{400}$ to $\frac{1}{150}$ grains (0.00016 to 0.0004 Gm.) of atropine has proved satisfactory. In patients of an age range from 12 to 60 pentobarbital sodium or seconal sodium, scopolomine hydrobromide and morphine, codeine or other narcotics are used, depending on the factors previously mentioned. For those patients over 60 whose metabolic processes have slowed, the dosages are reduced and the use of codeine or Demerol hydrochloride is preferred because they have the least tendency to depress respiration.

In emergency cases and occasionally in elective cases the premedication is administered intravenously, the dosages being adjusted to meet the increased rate of action.

An elective surgical procedure should not be started until it has been determined that whole blood is available in adequate amounts. In emergency cases the blood of all patients should be cross matched on admission. Blood is not expensive therapy; rather, it is probably the cheapest, because there is no doubt that 1 or 2 pints (500 to 1,000 cc.) of whole blood will so reduce convalescence that shorter hospitalization will more than make up for its cost. There is no branch of surgery in which blood is more frequently needed than in orthopedic surgery because of the large number of emergency cases, the length of many of the operations and the difficulty of securing complete hemostasis in bone work. Finally, facilities should be available to prevent the occurrence of hypoxemia. Too often it is the so-called "simple case" for which none of these precautions or safety measures have been arranged which results in disaster. There is no "simple case."

In pediatric orthopedics, generally speaking, it would seem that inhalation anesthesia is the most desirable. There are cases in which local anesthesia may be used. A few locals have been successfully done for the reduction of green-stick fractures of one bone of the forearm in patients less than 10 years of age. For manipulations, reduction of fractures involving overriding of long bones and in cases requiring surgical intervention, open drop ether or vinethene is used if the time required is to be short. Oxygen may be added by means of a catheter beneath the mask. If it is necessitated by the position of the patient, an endotracheal tube may be passed to insure an adequate and absolutely patent airway. The ordinary gas machine has too much dead space, permitting the accumulation of excessive amounts of carbon dioxide, to be used on patients below the age of approximately 10 years. There is a real need for a "children's machine" in every hospital. Although it is used in many localities, I do not use ethyl chloride for the induction of anesthesia in pediatric cases because of the possibility of ventricular fibrillation. With proper premedication I have found it unnecessary.

I do not feel that spinal anesthesia should be used unless the patient is 14 years of age or of comparable physical development. It has been, and can be, used with apparent safety, but it is preferable to withhold it until the spinal anatomy has become essentially adult.

From the age standpoint alone there is little choice between spinal and inhalation anesthesia for patients between the ages of 14 and 60 undergoing an orthopedic operation on the lower extremities. The absolutely essential factors are adequacy of airway, oxygen supply to the tissues and replacement therapy. In cases in which the patient is to be on his abdomen I prefer spinal anesthesia, either single dose or continuous, depending on the duration and extent of the procedure to be accomplished. The reason for this is that respi-

---

Read before the joint meeting of the Section on Orthopedic Surgery and the Section on Anesthesiology at the Ninety-Fifth Annual Session of the American Medical Association, San Francisco, July 5, 1946.

ration is least interfered with when low spinal anesthesia is used and relaxation of the large muscle masses is maximum. If spinal anesthesia is not practical or desirable and the patient is on his abdomen, as for a spinal fusion, an endotracheal type of anesthesia is done. I have also used endotracheal anesthesia for the hemipelviotomy for which I was called on to give an anesthetic. The reasons for using the endotracheal type are to insure an adequate airway at all times and to be able to resuscitate the patient if this should prove necessary.

In upper extremity work the nature of the case should determine the type of anesthesia. Such types of regional anesthesia as brachial blocks and triple nerve blocks find their greatest usefulness here. For surgery about the shoulder girdle I use inhalation anesthesia, usually endotracheal, because it leaves more room for the surgical team and also for the reason previously mentioned.

I do not use pentothal sodium as an anesthetic. It gives amnesia and is a powerful hypnotic. I use it as an hypnotic and secure relief of pain with nitrous oxide and oxygen with never less than 20 per cent oxygen. I also use pentothal sodium in inducing ether anesthesia to avoid the disagreeable and occasionally difficult and dangerous second stage of anesthesia. It is true that pentothal sodium can be used alone for many orthopedic procedures, but in my opinion this is neither safe nor desirable, because the drug must be given in amounts that profoundly depress respiration in order to produce sufficient narcosis to suppress reflex responses to pain.

The choice of inhalation agent is largely determined by local custom, the desires of the surgeon and anesthetist and the degree of relaxation required. In the age group under discussion (14 to 60), barring metabolic complications and explosion hazards, there is little to choose between the various agents if oxygen supply to the tissue, airway and replacement therapy are adequate.

Intocostrin (curare) may be used with light inhalation anesthesia, such as nitrous oxide-oxygen, to give adequate relaxation and safety from explosion. I have used the combination extensively and have found it both safe and satisfactory to surgeon and patient. The combination has been found of great value in operations on the bones of the face, as patients do not vomit when emerging from the anesthesia. For operations involving the administration of intocostrin an endotracheal tube is always used.

In the aged, the problems for the surgeon and anesthetist multiply because of the general metabolic depression of such patients. Because of the milder effects on the patient's metabolism, a combination of local or regional anesthesia and a light inhalation anesthesia for amnesia and additional relief of pain finds its greatest use in the aged. The muscle masses are diminished and relaxation is not such a severe problem. Absolutely minimal spinal anesthesia may be used on selected patients. Because of the low vital reserves, replacement and oxygen therapy are of the utmost importance, and if they are kept in mind the possibility of tragedy is minimized. With proper premedication and careful handling extensive hip operations may be done with a minimum of complications incident to anesthesia and surgery under surprisingly light anesthesia. However, regional and/or local anesthesia are to be preferred over any inhalation method if they can be used.

The most serious metabolic problem met in anesthesia for orthopedic surgery is that of diabetes. Because of insulin therapy and proper diet and care, more and more diabetic patients are requiring surgical intervention not only in the younger but in the older age groups. For amputations in these diabetic patients there is no substitute for refrigeration anesthesia, properly given. Because ether produces acidosis, its use is to be avoided in these patients. When cyclopropane can be used, it is probably the inhalation anesthetic of choice, although nitrous oxide-oxygen plus curare may be preferred in certain cases, namely, those of patients with cardiac complications. Regional, local and spinal anesthesia should be considered in cases complicated by diabetes even though their use might not be ideal in the light of other considerations.

Too much stress cannot be placed on supportive therapy before, during and after surgical intervention. Whole blood has no equal in treating hemorrhage. Plasma finds its use in cases complicated by crushing and trauma when whole blood has not been lost before or during surgery and in cases in which there is hemorrhage when whole blood cannot be secured. Oxygen administration even when inhalation anesthesia is not used is frequently of the utmost value, since it conserves the energy of the patient. The alleviation of fear and apprehension by wise and adequate sedation goes a long way to reduce the incidence of operative and postoperative shock. Replacement of water and electrolytes by the administration of isotonic solution of sodium chloride, and the provision of adequate nourishment by the giving of dextrose and aminoacids make for a smoother convalescence. It is not possible to be specific as to dosages and amounts in a paper of this type; there can be no substitute for good clinical judgment.

It is vital if medical science as related to surgery is to progress, that there develops an appreciation of the great importance of anesthesia in the overall picture. The day of "pouring ether" or of giving a "whiff of gas" or a "shot of spinal" is ending. The medical anesthetist is becoming more and more prominent because of the gradual realization that he can do much, if allowed, to make the task of the surgeon easier and the course of the patient undergoing surgical intervention smoother and safer.

Department of Anesthesia, Los Angeles County Hospital.

ABSTRACT OF DISCUSSION

Dr. C. J. Betlach, Santa Barbara, Calif.: The choice of anesthetic is not as important as the manner in which the anesthetic is administered. With the wide variety of anesthetics and methods now available, it is important that the anesthetic chosen be one with which the anesthetist is familiar if he or she is not fully trained. I disagree with Dr. Dillon with regard to pentothal sodium. I use pentothal alone a great many times, especially for the shorter procedures of five to fifteen minutes, and find it very satisfactory. It is sometimes difficult to get the pentothal started and get nitrous oxide or oxygen started, or cyclopropane started before the orthopedic surgeon has completed his procedure. There are many combinations of anesthetics that can be used in orthopedic surgery, and the one that I prefer and like to use a great deal is a combination of pentothal and nitrous oxide, or regional anesthesia and pentothal. In debilitated persons requiring amputation of the lower extremity, one can produce sufficient spinal anesthesia with as little as 35 mg. of procaine. The patient will still retain movement of his extremity, but he will have enough analgesia to carry out the procedure. I should like to emphasize that the anesthetist must anticipate shock and be prepared to keep the patient in good condition by the administration of fluids and whole blood.

DR. DOROTHY A. WOOD, San Mateo, Calif.: The armamentarium at the command of the anesthetist is as varied as the surgical picture demands, and it is therefore up to the anesthetist to adjust the anesthesia to the problem at hand. The practice of giving small doses of a combination of agents is an excellent one, particularly in combination with nitrous oxide and oxygen and with the maintenance of a high percentage of oxygen. I wish to concur with Dr. Dillon in stating my disapproval of the use of sodium pentothal as an anesthetic, for the drug must be given in amounts that profoundly depress respiration in order to produce sufficient narcosis to suppress reflex responses to pain. Dr. Dillon did not mention solution of tribromoethanol. During the last four years the orthopedic work with which I have been associated has largely been necessitated by accidents and casualties either industrial or traffic in origin. Patients have frequently arrived in the emergency room with multiple fractures involving two or more extremities, and 1 had both arms and both legs broken. In addition, there may be multiple lacerations which require suture. Roentgenograms are necessary and the facilities of the operating room are needed, so that transportation of the patient through the corridors becomes a problem. I have found that an 85 mg. per kilogram of body weight dose of solution of tribromoethanol facilitates all this, and that lacerations can be cleansed and closed, airway inserted and oxygen and nitrous oxide given at the time the more painful procedures are instituted. Frequently the patients have lacerations on the back which require that the patient be placed on his abdomen for part of the repair, and under anesthesia with solution of tribromoethanol this change in position can readily be accomplished. In fracture of the hip in which it is the surgical procedure to insert a pin, there are always delays and intervals in which no pain is inflicted while x-rays are being taken and developed and returned to the operating room with the report of the position, and we have found that anesthesia with this drug is satisfactory, with the addition of nitrous oxide and oxygen when the painful procedures occur. Again local custom comes to bear on this subject. Others with a limited experience with the drug may not be as favorably impressed, but I speak from the experience of fifteen years of almost daily usage for one reason or another. I should also like to say that I was the first one to administer vinethene to a human being, and I have not used it many times since.

DR. F. E. CLOUGH, San Bernardino, Calif.: I am neither an anesthetist nor an orthopedic surgeon, although I am an orthopedist by adoption since they began treating acute fractures. That is just a recent thing, because thirty or forty years ago an orthopedist never saw an acute fracture.

I live in a city of 60,000 people. All of the good anesthetists during the past five years have been in the war. The only fellows available to give anesthetics have been my age.

Over a period of forty-odd years I have had considerable experience in traumatic surgery, and through the last few years I have encountered a Colles' fracture or a greenstick fracture every few days. I was amazed on coming to San Bernardino many years ago to find that anesthesia was induced by ethyl chloride in a very large percentage of the cases, and much to my interest it is still being done. I have yet to see the first bad effects from that type of induction. Physicians here go ahead by themselves and do not hesitate to give enough ethyl chloride that the patient does not know what is being done when the fracture is set. One does not always have to wash out the stomach of a patient because he had some food within six hours. It is a great deal easier to let the patient put it in a pan, and I don't think anybody strangles from it. There is no need to get a trained anesthetist out of bed to do a lot of these things. There is too much tendency in the big hospitals today to feel it necessary to have from three to seven assistants and from two to five scrub nurses, when two persons helping could do the same amount of work.

DR. ALLEN CONROY, Chicago: I have heard nothing said about three problems that are peculiar to orthopedic surgery. One is the difficulty encountered with operative procedures around the neck, in which a cast or some other fixation apparatus is used to stabilize the head and neck and shoulders as one unit. For some time endotracheal anesthesia was used for that particular job, which ended with the patient almost completely enclosed down to the nipples with the tube sticking out through the cast at the mouth. A couple of near disasters occurred when the tube was removed. The fact that the position of the air passages had been changed during overcorrection was overlooked. As long as the tube was in, the procedure was safe; when it was withdrawn, the whole cast had to be taken off. So there might be something to be said for rather preliminary casting and testing of the position, or even allowing the patient to recover sufficiently till his throat reflexes have returned before making a final connection between the head cast and the shoulder portion. Second, the patient who is still profoundly anesthetized is in no position to correct for the circulatory changes that occur when he is set erect for some types of fixation. His muscle tone is gone, and probably some of the circulatory centers are inactive. He cannot compensate quickly enough, the blood pressure drops, and he goes into what resembles profound shock. I have found it satisfactory to pull the patient and the mattress beyond the upper end of the table and let the patient's head and neck and the center of the shoulders rest on the anesthetist's knee. Finally, many surgeons when performing a lumbar fusion or laminectomy expect the patient to be jack-knifed over a very high rise in the table. That is fine from the surgical point of view and I do everything I can to help the surgeon get that back straightened out so he can find a place to work. But I would beg of you to do something to allow some excursion of the diaphragm. One way to achieve that is with a roll under the hips and a horseshoe pillow that comes up the side of the body and underneath the shoulders. I have generally found that one has to make a compromise in the very fat patient. I think most anesthetists would appreciate some surgical compromise on the jack-knife position.

CAPTAIN JOHN DILLON, Los Angeles: I do not have a great deal to say regarding these momentary anesthetics. I had two Colles' fractures set without any anesthetic, and it did not do me any particular harm; so one can even go back to no anesthetic at all. The point is not what can be done with primitive methods but what is best and what can add to progress in medical science to the benefit of the patient. I am willing to agree that it would be less expensive if an anesthetist were not called out of bed in the middle of the night to give an anesthetic of thirty seconds for reduction of a greenstick fracture, but the problems under discussion, on the whole, have been of more major surgical importance. Ethyl chloride has been used and can be used. I have no particular objection against its use by anyone, although personally I do not like it. In regard to Major Conroy's difficulties, I have had the same difficulties, and they are very severe. The use of multiple spicas which sometimes involve both shoulders or both hips—in these combined orthopedic and surgical cases—is really very, very serious. One solution (and this is not the only solution), which proved satisfactory was the use of pentothal induction for a nitrous oxide endotracheal anesthesia, using curare as a preliminary relaxant. These patients will go along six and seven hours with nitrous oxide-oxygen anesthesia and a little codeine if they tend to get restless, or a little Demerol given intravenously, and at the end of the surgical operation they are flushed out with oxygen once or twice, the tube is removed and the patients will begin to talk and in less than an hour they want to eat. The multiple casts or heavy spicas, particularly on the shoulder girdle and round the hip when the patient has to be manipulated many ways, offer one type of solution.

INFECTIOUS GRANULOMATOUS LESIONS OF THE CERVIX

WILLIAM F. GUERRIERO, M.D.
R. JENNETT, M.D.
and
W. B. MANTOOTH, M.D.
Dallas, Texas

The group of infectious granulomas of the cervix include lesions resulting from tuberculosis, granuloma inguinale, syphilis and chancroid.

Their importance depends on their morphologic resemblance to carcinoma as seen at speculum examination, while in general the symptoms of the granulomatous cervical lesions are basically those of carcinoma. Minor deviations of this will be pointed out in the discussion of each type of lesion. The clinical course, therapy, psychologic effect on the patient and the prognosis, on the other hand, are vastly different from those in carcinoma.

In the two year period from March 1, 1944 to March 1, 1946 there were 123 patients admitted to the obstetric and gynecologic service of Parkland Hospital for biopsy of the cervix. Microscopic examination of the tissues revealed: carcinoma in 24, or 19.4 per cent; cervicitis in 79, or 64 per cent; cervical polyp in 3, or 2.5 per cent; adenoacanthoma in 3, or 2.5 per cent; cervical fibroid in 3, or 2.5 per cent; leukoplakia in 2, or 1.6 per cent; squamous metaplasia in 2, or 1.6 per cent; granuloma inguinale in 3, or 2.5 per cent; tuberculosis in 2, or 1.6 per cent; tertiary syphilis in 1, or 0.8 per cent, and chancroid in 1, or 0.8 per cent. In addition 26 cases of primary and secondary syphilis and 1 case of chancroid were found in the Dallas Venereal Disease Clinic of Parkland Hospital during the last ten months of this study.[1]

TUBERCULOSIS

In 1851 Giel [1a] wrote a clinical description of tuberculosis of the cervix, to which little new has been added. In 1892 J. W. Williams [2] wrote an extensive review for the first time in America and collected 68 cases of the disease from the literature. Many other significant papers followed, but the best modern review was contributed by Collins [3] in 1938, who reported 6 cases from his practice and added 185 from the literature.

Incidences as reported vary considerably, but it is believed that with correct diagnosis the incidence would be significantly increased. Counsellor and Collins [4] recorded an age incidence of 20 to 40 in 73 per cent of their cases and stated that marriage and pregnancy are contributing factors in the disease. Our cases were in a 23 year old Negro nullipara and a 43 year old white octipara.

Tuberculosis of the cervix is primary if other foci are absent. The origin of primary cervical infections is by introduction from the outside. In our first case infection was evidently primary, since no other focus of infection was found despite nearly two years of observation.

In our second patient the lesion was secondary to foci in the lungs and upper part of the genital tract. In approximately 85 per cent of cases tuberculosis of the cervix is secondary in the fallopian tubes, lungs, genitourinary and gastrointestinal tracts, in the order given.

Four different types of lesions, depending on the resistance of the host, the virulence of the infection and the amount of tissue reaction, may be present: ulcerative, miliary, papillary and bacillary catarrhal. The ulcerative type is most commonly seen and appears as a large area of deep ulceration with ragged undermined edges and a red, soft, easily bleeding, granulomatous base. Microscopically, the fungoid vegetation is covered with any of the various epithelial types and the stroma is infiltrated with tubercular elements.

The miliary type exhibits external cervical tubercles, microscopically typical, with or without caseation. In the bacillary catarrhal type the cervix appears grossly normal but often is large and edematous because the infection is deep in its substance. Microscopically, tuberculous nodules in various stages of evolution are seen. The ulcerative and papillary lesions are not grossly distinguishable from carcinoma and, like it, may extend to the vagina, parametrium, uterus and adnexa. The bleeding may be spotty or profuse because of the ulcerative nature of the lesion. Our first patient evidenced postcoital spotting, but bleeding was sufficiently profuse in the second patient to require the replacement of blood. Leukorrhea is also a prominent symptom and is grayish yellow, thick, profuse and foul because of the destruction of tissue and the presence of caseous material. Often it is the only symptom and may be overlooked both by patient and physician. In our cases neither patient gave a history of leukorrhea although each admitted its presence for an indefinite period on specific questioning. Loss of weight, night sweats, anemia and weakness may be present, but generally these are due to the presence of tuberculosis elsewhere in the body. Pelvic pain is present with secondary infection or with tuberculous extension to the vagina, parametrium and upper part of the genital tract.

Clinically the diagnosis is seldom made, although one must be suspicious of all granulomatous lesions of the cervix in patients with tuberculosis elsewhere. In neither of our patients was the lesion correctly diagnosed preoperatively, since the usual diagnosis of carcinoma was made. Only after the pathologist failed to confirm the diagnosis of carcinoma was the true nature of the condition suspected. The finding of Mycobacterium tuberculosis in the vagina or in the injected guinea pig is, of course, definite.

The treatment may be curative or palliative, depending on parity, age, localization to the cervix, extension or degree of distant focus. The operation may consist of cervical amputation or total hysterectomy. Our first patient was a young nullipara with the lesion localized to the cervix and without evidence of tuberculous foci elsewhere; a low cervical amputation was performed. Later she received a subcastration dose of

---

From the Departments of Obstetrics and Gynecology of Parkland Hospital and the Southwestern Medical College.

Read before the Section on Obstetrics and Gynecology at the Ninety-Fifth Annual Session of the American Medical Association, San Francisco, July 4, 1946.

roentgen radiation. After two years there was no evident recurrence, she was in good physical condition and her menses had returned six months after radiation. The second patient with extensive involvement was treated palliatively.

GRANULOMA INGUINALE

The cervix is now recognized as a primary or secondary site of granuloma inguinale. Because of the presence of lesions other than in the inguinal region, Pund[5] suggested that the entity be called "granuloma venereum." Since this is often confused with "lymphogranuloma venereum," we offer the term "granuloma venereum cervicitis."

Gardner[6] in 1928 suggested that some of the exuberant nonmalignant granulomatous lesions of the cervix might be granuloma inguinale. In 1934 McGee[7] reported 8 such lesions from Charity Hospital of Louisiana but was unable with the staining methods then at his disposal to demonstrate Donovan bodies in the tissues. Nevertheless the histopathology and the favorable response to antimony and potassium tartrate were identical to those of true granuloma inguinale. Later Arnell and Potekin[8] (1939) were able to demonstrate Donovan bodies in preserved tissues from 4 of McGee's patients by the use of silver stains. Pund and Greenblatt[9] in 1937 established granuloma inguinale as a distinct clinical entity by utilizing the fact that Donovan bodies have a special affinity for silver. Arnell and Potekin[8] in 1939 reported 38 cases and collected reports of 12 others between 1937 and 1939. In 1938 Pund and Gotcher[10] and Pund[11] in 1944 demonstrated that the disease can involve the uterine corpus, parametrium and adnexa and can produce death.

Like tuberculosis, granuloma venereum cervicitis undoubtedly will be found, with correct diagnosis, to be a relatively common lesion particularly in the Negro.

The specific etiologic agent is a micro-organism, the Donovan body, probably a protozoan, which to our knowledge has never been cultured and is pathogenic only for man.

On examination the early lesion appears as a shallow ulcerated area with well defined edges and a diffuse, red, granulomatous base. The advanced lesion consists of a large cauliflower excrescence of soft, red, friable tissue displacing part or all of the cervix. Not infrequently there may be extension to the adjacent vaginal walls or uterus, adnexa, inguinal regions and bones. Both types bleed easily and resemble carcinoma except for the softness of the lesions. However, it must be remembered that granulomatous lesions which contain large amounts of fibrous tissue may feel hard like carcinoma. All 3 of our cases were of the advanced type. In 2 patients the lesion was confined to the cervix, but in the other it extended to the vagina, uterus, adnexa and bones. This patient died of the disease.

Microscopic examination of the lesion reveals an abundance of loose connective tissue with many young blood vessels. The exuberant granulation tissue is interspersed with large numbers of plasma cells, and there is a diffuse infiltration of polymorphonuclear leukocytes. The essential microscopic feature is the presence of large monocytes with many intracytoplasmic spaces in which Donovan bodies are dispersed. These bodies are elliptic or round, stain deeply and are usually arranged peripherally in the intracytoplasmic spaces.

The symptoms do not vary from those of carcinoma, but the youth of the patient is suggestive of a nonmalignant lesion. Two of our 3 patients were parous; the other was not. All were young Negresses aged 21, 22 and 28 years. This youthful incidence agrees with that in other published reports.

The 21 year old pregnant patient was admitted at term for painless bleeding of moderate amount. The 22 year old patient was readmitted three weeks after delivery because of excessive bleeding. The 28 year old nonpregnant patient was admitted to the gynecologic service because of profuse vaginal bleeding. Pain was present in 2 patients but was due either to extension of the disease or to secondary infection, a frequent complication. Arnell and Potekin[8] reported pain in 70 per cent of their patients. Secondary anemia is nearly always present, the hemoglobin level being 60, 55 and 40 per cent in our 3 cases.

The final diagnosis depends on a demonstration of the Donovan body in smears, scrapings or a biopsy specimen. Better results are obtained by the use of biopsy. Diagnosis is by no means a simple matter in chronic cases, as the characteristic monocytes may be scarce. Extensive search of material from repeated biopsies and the use of special stains is frequently necessary, as shown in the study of the nonpregnant patient of this series. After four separate biopsies failed to reveal carcinoma Donovan bodies were found by diligent search of Giemsa-stained sections. The biopsy should always include the base of the lesion as well as normal cervical tissue. If hematoxylin and eosin stains show the tissular reaction of granuloma venereum cervicitis without the demonstration of the Donovan bodies, Dieterle's silver stain or Giemsa stain should be used. Recently Kornblith[12] has advocated a skin test as an aid in diagnosis, but his work as yet lacks confirmation.

Therapy is general, local and specific. General measures include adequate diet, vitamins, penicillin and sulfonamide compounds given parenterally. Local therapy in the form of sulfonamide jellies or sulfonamide powder is frequently of benefit. Specific therapy by the administration of one of the antimony compounds over a period of six months as stibophen (Fuadin) 5 cc. twice weekly, antimony and potassium tartrate 1 per cent, 10 cc. twice weekly, or Anthiomaline (antimony and lithium thiomalate) 3 cc. three times weekly. Our 3 patients were treated with stibophen with a good response in 2 of the cases. The third patient with dissemination of the infection to other areas of the body died from the disease.

The disease as it affects the pregnant patient deserves special mention. The therapeutic response is poor, infection is common and large growths may cause dystocia, hemorrhage and cervical and uterine tears. In some cases delivery by elective cesarean section with or without hysterectomy may be indicated. Our term pregnant patient was delivered of a live infant by low cervical section after four hours of labor. The postoperative course was uneventful, although a morbidity of three days occurred with the highest temperature being 101 F. On the other hand, vaginal birth is not impossible, since the disease of our second patient was not diagnosed until three weeks post partum. Obviously the disease was present and unrecognized during pregnancy.

SYPHILIS

Nearly a century ago syphilitic manifestations of the cervix were first noted by Ricord,[13] and until recently these lesions have been regarded as uncommon. In a large and carefully examined series of patients Davies[14] reported an incidence of 44 per cent. Sharp, Alexander and Schoch[15] in 1943 reported 10 primary and secondary syphilitic cervical lesions from the Dallas Venereal Disease Clinic of Parkland Hospital and stated that in many instances the initial infection in the female was on the cervix. Cervical syphilis may be primary, secondary or tertiary. The primary stage is represented by the chancre. The secondary stage appears either as an erosion, macule, papule or ulcer. The tertiary lesion is an ulcerative or proliferative gumma and is the type most commonly confused with carcinoma. Our 26 primary (10 chancre) and secondary (6 erosions, 5 macules and 3 ulcerations) syphilitic lesions were found by the performance of routine dark field examination on all women with infectious syphilis or exposed to infectious syphilis.[15a] In the biopsies made in this study only 1 tertiary syphilitic lesion of the cervix was found.

While the primary lesion on the outer genitals presents and retains its characteristic and pathognomonic aspect, the chancre of the cervix undergoes a rapid and variegated evolution. In the stage of greatest development it appears as a deep, funnel-shaped sore with thickened, rounded edges which slope down to a smooth floor of glistening brown. A grayish or white pseudomembrane composed of necrotic tissue and therefore firmly attached covers the base of the ulceration. A thin red or reddish brown line encircles its periphery.

The macules are a grayish white due to a thickening of the overlying epithelium, which may also lead to a slight elevation of the affected area. Large macules or confluences of smaller ones are termed mucous patches. The erosion is pinkish or brownish, but more often it is covered with a grayish exudate which, though small in amount, abounds in spirochetes.

Secondary ulcers appear in various forms and morphologically resemble early carcinoma in many instances. Some are red, varied in size and devoid of characteristic features. There is present an associated profuse, yellow, mucopurulent discharge with a considerable amount of detritus and a sickly odor which is different from the stench of cancers.

The tertiary form is that of a gumma, which in the majority of instances undergoes ulceration and necrosis; or, as in our patient, a predomination of tissue proliferation occurs so that a fungating, soft mass replaces most or all of the cervix.

On microscopic examination many new capillaries are found, about which there are dense infiltrations of lymphocytes and plasma cells. Giant cells are present in varying numbers. The endothelium of the capillaries is swollen or proliferated, so that the lumen is narrowed or even obstructed. The histologic picture, therefore, is that of any chronic inflammation and is in itself by no means pathognomonic unless one succeeds in demonstrating Spirochaeta pallida in the tissues.

Generally it is thought that primary and secondary lesions of the cervix produce few if any symptoms. However, Gellhorn[16] and Morrison[17] noted a loss of appetite, fever, articular pains, malaise, abnormal vaginal bleeding and serosanguineous leukorrhea. The patient with tertiary syphilis, on the other hand, complained of bleeding of four months' duration as her only symptom. We noted in this series that the preceding symptoms were frequently present and responded immediately to antisyphilitic therapy.

Syphilitic lesions are important, since many are clinically mistaken for erosions and carcinoma of the cervix. It must not be forgotten, as Warthin[18] has insisted, that carcinoma and syphilis of the cervix coexist frequently. By the same token other granulomatous lesions of the cervix have been observed concomitantly with syphilis of the cervix.

The diagnosis of primary and secondary lesions depends on the finding of S. pallida by dark field examination, since serologic tests are not always positive until three weeks after the initial infection. The tertiary lesion is diagnosed by biopsy and positive serologic tests.

Recognized antisyphilitic therapy is advocated for all syphilitic lesions of the cervix.

CHANCROID

Chancroid of the external female genitalia is common, but this type of cervical infection is rare. We were able during the last six months of this study to establish the presence of this entity in 2 white women. A search of the literature reveals only Day's[19] report of 2 cases. Like the other granulomatous lesions of the cervix, the rarity of this entity is probably due more to a lack of examination and diagnosis than to an actuality. Chancroid, or ulcus molle cutis, is a highly infectious, localized lesion caused by inoculation with Hemophilus ducreyi, a gram-negative bacillus appearing singly or in short chains. The so-called histologic changes of chancroid are generally believed to be nonspecific. However, Heyman, Beeson and Sheldon[20] have contended that there is a specific histologic pattern. In their opinion the lesion consists of three zones. The surface zone, or base of the ulcer, is shallow and made up of polymorphonuclear leukocytes, fibrin, red blood cells and necrotic tissue. Below this is a fairly wide zone of edematous tissue with endothelial cells in various stages of proliferation outnumbering all other cellular components. Numerous newly formed blood vessels may show palisading with occasional degeneration of the vessel walls and thrombosis. Finally there is a deep zone with a dense infiltration by plasma cells and lymphocytes.

[19] Day, L.: Chancroid of the Cervix: Report of Two Cases, Proc. Staff Meet., Mayo Clin. **20:** 70 71 (March 7) 1945

Symptoms include soreness in the lower part of the abdomen, a foul, grayish vaginal discharge and burning and pain in the vagina. On examination there may or may not be ulcers of the external genitalia and inguinal lymphadenopathy. Pronounced vaginal tenderness is present to such an extent that the patient will not permit adequate bimanual examination. The cervix appears to be red and edematous with one or more round, firm, punched-out, ulcerated lesions on the portio. The ulceration may be covered with an easily removable whitish exudate. In some instances similar lesions are present in the vaginal vault.

Diagnosis is made by smear, culture, Ito-Reenstierna skin test and biopsy. In a series of 175 cases Kornblith[21] and his co-workers reported that smear was the best single criterion of diagnosis, with specific identification possible in 88 per cent of cases. In advanced cases, especially in women, on the other hand, smears are frequently crowded with many bacteria and diagnosis is often impossible; the United States Army does not recommend them.[22]

Heyman, Beesen and Sheldon[20] obtained positive cultures in 40 per cent of their cases using defibrinated rabbits' blood as a medium. Skin tests alone are of limited diagnostic value.

The efficacy of biopsy in the diagnosis has recently been stressed in advanced lesions.[20] In our 2 cases positive diagnosis was made by the finding of H. ducreyi and by positive skin tests. Confirmation of the diagnosis was obtained by biopsy in 1 case.

Treatment consists of the administration of sulfathiazole parenterally and locally for seven to ten days.

CONCLUSIONS

1. Infectious granulomatous lesions of the cervix are more commonly present than has previously been suspected.

2. The improvement of diagnostic facilities has made specific diagnosis of these lesions possible.

3. When a clinical diagnosis of carcinoma of the cervix is not substantiated by microscopic examination, one of the granulomatous lesions should be suspected.

4. The importance of specific diagnosis rests in the fact that the clinical course, therapy, psychologic effect on the patient and prognosis are vastly different from those for carcinoma.

ABSTRACT OF DISCUSSION

Dr. William B. McGee, San Diego, Calif.: Two women came into the hospital for biopsy of the cervix, with the impression of carcinoma. The attending physicians were so sure that these women had carcinoma that they inserted radium at the time of the biopsy. By the time the biopsy came back as a granulation tissue the patients had already received radium in a fairly large amount. It was learned from these 2 cases that the use of radium is contraindicated in the noninfectious granulomas, because both patients became progressively worse. The problem that I and my associates had in the differential diagnosis of our 8 cases (a series including the 2 just mentioned) was between granuloma and tuberculosis, which are easily differentiated. In tuberculosis instead of a decided infiltration of polymorphonuclear leukocytes there is a pronounced infiltration of lymphocytes, tubercles, giant cells and caseous material. Tuberculosis of the cervix is almost always secondary to tuberculosis in the body elsewhere, and the cervical infection is usually secondary to that in the fallopian tubes. If tuberculosis can be ruled out in the chest, the gastrointestinal tract and the genitourinary tract, and there is a positive diagnosis of tuberculosis of the cervix, then the patient should have an exploratory laparotomy; if tuberculosis is found in the pelvis, then she should have a radical surgical operation. Another differential diagnosis which Dr. Guerriero did not mention is a decidual reaction which is occasionally seen on the cervix in pregnant women. Here, the diagnosis is made by microscopic section and the condition requires no treatment, as it is a self-limiting disease and disappears at the end of the pregnancy. The question of syphilis as a differential diagnosis from granulomatous lesions of the cervix is a difficult one. The early syphilitic lesions appear grossly as an extremely early cancer, and the later tertiary lesions of the cervix, the gummatous lesions, look decidedly similar to carcinoma. Here again microscopic study provides a definite diagnosis, revealing giant cells, lymphocytes and decided changes in the blood vessel walls. The lesions respond, as Dr. Guerriero told you, to the antisyphilitic treatment. Most of the reports on granulomas have come from the South. Physicians will definitely see more of these lesions in other parts of the country. With mass migration of war workers and military personnel to all parts of the country, these granulomatous lesions will be seen in other parts of the country, although I question if the Donovan body will live in this wonderful California climate.

Dr. William F. Guerriero, Dallas, Texas: I want to thank Dr. McGee for his able discussion, because as an intern under him in 1934 and 1935 some of my stimulation for this work was aroused. Dr. Williams' paper interested me very much because I was afraid, in presenting such a subject, that it might not be of general interest to the Section. However, with the mass migration of the Negro from the South to the North and to the West, as Governor Jones of Louisiana has shown, it may be necessary for all the practitioners of medicine to become familiar with these diseases. These lesions are not uncommon, as was shown by the high incidence in this series. One must be ever conscious of these lesions because in medical practice today, particularly in obstetrics and gynecology, one usually thinks only in terms of the common lesions of the cervix or carcinoma. By making the proper diagnosis these lesions can be treated adequately to offer the patient a good prognosis. In most instances, one must rely on the pathologist, as the clinical signs and symptoms definitely resemble carcinoma and other cervical lesions.

HISTORY OF THE AMERICAN MEDICAL ASSOCIATION

MORRIS FISHBEIN, M.D.
Editor, Journal of the American Medical Association
and Hygeia, the Health Magazine
Chicago

(Continued from page 771)

(NOTE.—*Following is the twentieth chapter of a history of the American Medical Association in process of development for publication in connection with the celebration of the Centennial of the American Medical Association in Atlantic City in June 1947.*

The general account of the history of the Association will be followed by individual histories of the various councils, bureaus, publications and other activities of the Association. The general account is written by the editor of THE JOURNAL. *Each of the other historical contributions will be by a member of the individual council, bureau or agency responsible and now associated with it or directly related to its work. Included will be photographs, signatures and a brief biography of each of the hundred presidents of the American Medical Association. This feature has been prepared by Dr. Walter L. Bierring.*

It will be impossible to publish all of the material in THE JOURNAL. *The complete work will be published in book form. It is hoped to have it available by the time of the annual session.*—ED.)

CHAPTER 20. *The War*

1915-1919

1915

SAN FRANCISCO

Late in 1914, as one of its many exposés of "patent" medicines, THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION published a report on a product manufactured by the Chattanooga Medicine Company of Tennessee called "Wine of Cardui." The article had been prepared as a joint effort of the laboratory of the Association, the Council on Pharmacy and Chemistry, the Division of Propaganda for Reform and the editorial department. The facts stated were so challenging that the owners of the Chattanooga Medicine Company (the Patton family, one of whom was a leader in the Methodist Church South) sued for libel. The record of the suit is told in another chapter. The company also sued Dr. Oscar Dowling, who was secretary of the state board of health in Louisiana. The Board of Trustees determined to make a complete defense in the case and the attorneys for the American Medical Association—Loesch, Scofield and Loesch—were instructed to take charge. Because the proprietors of secret nostrums were now attacking the citadel of American medicine, the Board of Trustees appointed a committee to prepare a special report to the medical profession for presentation to the House of Delegates.

PHYSICIANS AND PUBLIC HEALTH

In opening the annual session for 1915, Dr. Victor C. Vaughan emphasized particularly the need for improvement of postgraduate medical education. He felt that the medical profession might be losing its prestige in relationship to the great advances that were being made in preventive medicine. In Michigan, for instance, the campaign against tuberculosis was being led by a group of whom three were not physicians.

The Board of Trustees indicated that the rapid extension of the interests of the Association had so affected its financial status that profits were reaching the vanishing point. The entire profit for the year was less than $4,000. While its work was altruistic, the Board warned the Association that the expenses must not increase but should decrease.

HOUSE OF DELEGATES ATTACKS NOSTRUMS

For the first time in the report of its activities to the House of Delegates a special section was introduced on the law suits of the Association. As has already been mentioned, these will be covered in a special chapter of this history. However, in accordance with the action taken by the Board of Trustees at its session in February, a special report had been prepared on the work of the Council on Pharmacy and Chemistry by a committee of the board, including Dr. W. T. Councilman, Dr. W. W. Grant and Dr. M. L. Harris. Following the presentation of this extensive report the Board of Trustees offered a resolution:

> *Resolved*, We, Members of the House of Delegates of the American Medical Association, believe that every effort must be made to do away with the evils which result from the exploitation of the sick for the sake of gain. Earnestly believing that the continued toleration of secret, semisecret, unscientific or untruthfully advertised proprietary medicines is an evil that is inimical to medical progress and to the best interest of the public, we declare ourselves in sympathy with, endorse and by our best efforts will further the work which has been and is being done by the Council on Pharmacy and Chemistry of the American Medical Association in the attempt to eliminate this evil.

The House of Delegates not only endorsed fully the activities of the Council on Pharmacy and Chemistry and of the Board of Trustees in furthering its work but also advised all members of the medical profession to withhold their support from periodicals that advertised proprietary remedies not investigated and accepted by the Council.

SOCIAL INSURANCE

The report of the Judicial Council, under the leadership of Dr. Alexander Lambert of New York, was one of the most extensive in the history of the Association. This report was to have a tremendous effect on the future activities of the Association; it covered such serious topics as the disciplining of Fellows of the Association who received commissions from the manufacturers of drugs and instruments and who thus violated the Principles of Ethics. An elaborate report of many pages dealt with workmen's compensation laws, social insurance in Europe, compulsory sickness insurance and other forms of protection against the hazards of disease and injury. Many pages dealt with industrial insurance in the United States. Attention was called to the difficulties of European physicians, particularly those in Germany, in maintaining a high standard of medical care, insuring free choice of physician and similar basic factors. In concluding its report the Judicial Council stated that its whole purpose was education of the medical profession concerning the trend. The Judicial Council said "In whatever country the social equilibrium has been upset by new laws of compensation there have followed in the wake of compensation for accidents other insurances tending toward the complete insurance systems of England and Germany." The Judicial Council called attention to articles by I. M. Rubinow on social insurance and the medical profession which had been published in THE JOURNAL, and it continued "It is evident, therefore, that once the old social and legal equilibrium has been upset, society tends to follow to the logical conclusion until it reaches a new equilibrium under a new social system." The Judicial Council indicated that we had in the United States a disjointed mass of insurance schemes and pension systems and that in several countries abroad these various social elements had been combined into a single form. The report said:

> In several countries abroad the same various social elements have been combined into some form of workable adaptability by which various accident and sickness insurance, invalidism and old age pensions have been brought together to form social forces which have tended to reduce the destitution of large masses of human beings. These forces unquestionably tend to improve the social condition in any given community, and, for the carrying out of any scheme tending to human betterment, the medical profession must necessarily be included, whether it be to judge of sickness or health insurance, whether it be for the prevention of the intensity of injury in the individual from accident or for the prevention of the spread of disease in a community at large. The medical profession will accept its responsibility in these new social conditions as it has always accepted its responsibilities in the past. The Judicial Council therefore presents this abstract of existing social insurance in this country and abroad.

The reference committee which considered this report recommended that the constituent state societies bring it to the attention of their members as a *"vade mecum* on these important social economical problems."

THE COUNCIL ON HEALTH AND PUBLIC INSTRUCTION

Again the Council on Health and Public Instruction had an extensive report on public health conditions in the United States, public education, the vast work of its speakers' bureau, its bureau of literature, its sections on legislation (both state and federal) and on the work of its many subcommittees. The Council felt that the most valuable work it had done was the coordination and harmonizing of the work of different organizations. There were reports of committees on women's and children's welfare, cancer, expert testimony, the National Education Association, the conservation of vision and similar subjects.

REORGANIZATION OF SECTIONS

Significant also at this session was the effort of a committee headed by Dr. Hugh Cabot to reorganize the work of the scientific sections. The Association must provide not only for the highly trained specialists but also for great numbers of general practitioners to whom it represented their one scientific organization. The committee recommended the establishment of a standing committee or council on section work. This recommendation was accepted by the House of Delegates. The result was the establishment of the Council on Scientific Assembly, which has, since that time, been of the utmost significance in advancing the scientific programs of the Association.

INFANT FOODS

Much attention was attracted by a resolution to control the advertising of proprietary infant foods. Several resolutions urged participation by the Association in the work of medical milk commissions with a view to improving the quality of milk supplied to the nation.

THE NATIONAL BOARD OF EXAMINERS

In his address at this session of the Association Dr. William L. Rodman had recommended the establishment of a national board of medical examiners. The committee to which the report was referred recommended that it be submitted to the House of Delegates for approval. A minority report suggested reference instead to the Council on Medical Education. This report was adopted and the American Medical Association took part, through the Council, in the establishment of the National Board of Medical Examiners.

HARRISON ANTINARCOTIC LAW

The antinarcotic law known as the Harrison Law had been passed and approved on Dec. 7, 1914. The Council on Pharmacy and Chemistry recognized the weaknesses of this law in permitting the sale and use of narcotics when contained in proprietary and stock preparations. On recommendation by the Board of Trustees, the House of Delegates took action to bring this matter to the attention of the Congress of the United States, so that the indiscriminate sale of proprietary and other preparations containing narcotics should not be permitted.

GRADUATE INSTRUCTION

In his address to the House of Delegates President Victor C. Vaughan had indicated the great desirability of participation by the American Medical Association in sending teams of clinical teachers to the individual states to bring general practitioners up to date in medical practice. The Board of Trustees was told to take the matter in hand. Out of that suggestion came a procedure still followed in many states for extending graduate education of physicians in rural areas.

1916

DETROIT; SICKNESS INSURANCE

The first subject to come before the meeting of the trustees early in 1916 was national legislation on sickness insurance. Drs. Alexander Lambert and Henry B. Favill appeared before the board to speak on the subject. Bills had already been introduced in Massachusetts and New York. It was recognized that the relation of the medical profession to any plan of sickness insurance was vital. A special committee appointed jointly by the Council on Health and Public Instruction and the Judicial Council was established to have charge of this investigation; the Board of Trustees requested submission of the plan and of a budget.

The agitation for a presiding officer in the House of Delegates was brought before the Board of Trustees; the Board rightly said that the decision would have to be made by the House of Delegates.

The joint committee on sickness insurance presented a statement. It pointed out that the purposes and duties of this committee would be to make a careful compilation of information concerning health and social insurance and the relation of physicians thereto and to do everything in its power to secure such constructions of the proposed laws as will work the most harmonious adjustment of the new sociologic relations between physicians and laymen which will necessarily result therefrom. The committee was given great power to study and to act and an adequate budget to meet all of its needs. It was also recommended that full publicity be given to its work.

In the course of the year President Rodman had died; the vice president, Dr. Albert Vander Veer of Albany, then over 80 years old, served thereafter as president.

ADVERTISING BY PHYSICIANS

As an indication of its seriousness in considering infractions of the Principles of Ethics, the Judicial Council reported publicly that it had taken action in 2 cases involving the charge of grossly advertising in the public press. One of these involved a physician of Wichita, Kan., who was dropped from the Fellowship roll of the American Medical Association. The second case was that of a former President of the Association, Dr. John B. Murphy of Chicago. Charges had been brought before the Judicial Council that the accused had caused or permitted to appear in a publication with which his name was connected photographs and an article which violated the Principles of Medical Ethics in that they were self laudatory and defied the traditions and were contrary to the ideals of the medical profession. The Judicial Committee condemned this publication as being offensive and in bad taste. Because the testimony indicated that the publication complained of was not intended by the accused to be self-exploiting advertising, the Judicial Council accepted his explanation and apology.

MEDICAL PREPAREDNESS

The most important aspects of the address made by Dr. Vander Veer concerned the preparedness of the medical profession in relation to the threat of war. As Acting President of the Association he had cooperated with other organizations in appointing a strong committee of American physicians to consider plans for civilian medical preparedness. Repeated conferences had been held. Already suitable boards and committees had been established to confer with the President of the United States and to offer to him the services of the medical profession. President Wilson had expressed himself as much pleased with the patriotic actions of the medical profession and assured Dr. Vander Veer that the government would avail itself of the services that were tendered. Base hospitals were being formed, and four such units were ready for mobilization.

PROHIBITION

Through the office of the secretary there came to the House of Delegates a plea for cooperation by the medical profession in combating the liquor evil.

THE BOARD OF TRUSTEES

In its report to the House of Delegates the Board of Trustees called attention to the relationship of the profession to the social state. The Board indicated that it had granted a considerable sum of money mainly for acquiring information. The Board of Trustees said:

> We are entering on a period of great changes in social organization; a period which will necessitate a far closer organization of the people in all forms of activity, and this particularly calls for united strength in opposing disease. It is true we have not so strongly felt the necessity for this as have other nations, but the time has come when we can no longer resist the social movement, and it is better that we should initiate the necessary changes than have them forced on us. On such information, laws regulating social medicine, which will be just both to the medical profession and to the public, whom it serves, must be based. All of our councils have worked in perfect harmony with other bodies, often outside of the profession, which have had the common good in mind.

SPEAKER OF THE HOUSE OF DELEGATES

The Judicial Council recognized the desirability, if not necessity, of having for the House of Delegates a presiding officer familiar with the transactions and also with the best methods of expediting the work of the House. The Judicial Council, therefore, recommended that the House take up the election of a speaker and proposed the necessary amendments to the Constitution and By-Laws to make this possible. The House of Delegates approved these recommendations.

COUNCIL ON HEALTH AND PUBLIC INSTRUCTION

In furtherance of the obligations placed on it, the Council on Health and Public Instruction had made a survey of state public health activities begun in 1914 by Dr. Charles V. Chapin. This included a rating sheet of the forty-eight state health organizations and exhaustive tabulations of their various activities, appropriations and expenditures. This action marked the beginning of a movement for elevation of the field of public health as did the first report of the Council on Medical Education in education. A request had come for a similar survey of municipal health departments, but the Council had not been able to devise any feasible plan for the purpose. An attempt had been made also to survey voluntary public health organizations. Such a report had been prepared and published and it had been accepted by the American Public Health Association.

The committee was discharged and a new central committee on public health organization was established to continue such studies. The efforts of the Council in the direction of cooperation had borne fruit; many leading organizations were cooperating fully with the medical profession.

Significant was the report of the subcommittee of the Council dealing with social insurance! Understatement indeed was the opinion that this subject would in all probability be one of the most important to occupy the attention of the medical profession in the next few years both from an economic and from a medical point of view.

The Council had secured the services of I. M. Rubinow, Ph.D., who was chief statistician of the Ocean Accident & Guarantee Corporation and president of the Actuarial Society, as an executive secretary; it had opened a bureau for study of social insurance in New York City. The Council presented a statistical study of the medical profession of the United States. It pointed out, however, that there were not available reliable figures concerning the incomes of physicians and other economic facts of interest. It proposed

> to educate the American medical profession in the general principles of social insurance, particularly health insurance, the economic and social significance of the movement to obtain such insurance throughout the United States, and the absolutely essential part which the medical profession must play in a successful adaptation of this new legislation to American conditions.

It seems to have been rather taken for granted that such compulsory sickness insurance laws would be passed in the United States. The committee felt that it should work to avoid the conflicts that had arisen in England at the beginning of a similar movement and which had resulted in a large amount of bitterness between the profession and the public that might easily have been prevented by properly conducted activities.

In its report on social insurance the committee, under the chairmanship of Dr. Alexander Lambert, presented a statement more than thirty-five pages long opposing voluntary sickness insurance and agreeing that only compulsory state insurance would reach the group of people who needed help most. It then discussed in detail the compulsory insurance schemes of all foreign countries in which such systems prevailed, with the majority of the emphasis on the comprehensive system in Germany. The major portion of this extensive report had been prepared by Dr. Rubinow. The report concluded with a consideration of conditions prevailing in the United States for protection against the hazards of sickness among trade unions, lodges, fraternal societies, commercial insurance companies and similar agencies. The report was inclined to accept the conclusion of Drs. B. S. Warren and Edgar Sydenstricker that the democratic character of an effective health insurance system is most pronounced in a governmental system. It was agreed that the experience of European nations with health insurance had shown that governmental systems were the only systems which accomplished the purpose desired. Then came the health insurance act developed by the American Association for Labor Legislation. The report concluded with a general comment to the effect that it had made no attempt to bring together the advantages or disadvantages or to argue for or against health insurance. It favored the German system over that in England and it said

> However one may criticize the details, the insurance act has unquestionably improved the health of the working classes which have come under the law.

When this extensive report was turned over to the Reference Committee on Legislation and Political Action, under the chairmanship of Dr. E. J. Goodwin of Missouri the reference committee recognized the exhaustive character of the report. It was proposed that the Council on Health and Public Instruction should continue to study the subject and to educate the profession concerning it. The reference committee approved such study and approved further establishment by each state association of a committee on social insurance to work in conjunction with the Committee on Social Insurance of the American Medical Association.

COUNCIL ON MEDICAL EDUCATION

Again the Council on Medical Education indicated its progress in merging poor medical schools, raising standards of education and eliminating schools of quackery. Here is a striking statement:

> The largest number of these institutions at present is found in Illinois, where conditions are especially favorable. Besides the class C medical schools which continue to exist there are in Illinois colleges of osteopathy, chiropractic, chiropody, naprapathy, somopathy, physcultopathy, refraction, optics and a legion of others, most of which have for their chief inducement elegantly printed diplomas conferring the degree of "doctor" of this, that or the other. The courses offered for such degrees are in some instances so notably a makeshift as to be ridiculous, and an insult to education. Some are offering courses under two or more titles, and others appear to be doing a retail business in dispensing degrees in all the "forms" or "systems" of healing which may have been or ever shall be enumerated.

The report urged the various states of the nation to protect themselves against such low grade institutions.

Pursuant to the recommendation that had been made by Dr. Rodman, the Council on Medical Education reported the organization of the National Board of Medical Examiners with the assistance of the Carnegie Foundation for the Advancement of Teaching.

A special committee to cooperate with the Red Cross had drawn up a complete arrangement for medical service through the Red Cross.

PUBLICITY AND THE ELECTION OF PRESIDENT

Much furor occurred in the House of Delegates at the meeting to elect officers when a Detroit newspaper announced that Dr. Charles H. Mayo would be elected President three or four hours before the election was held. The publicity had been issued without any activity on the part of Dr. Mayo; he was unanimously elected.

FROM THE MOUTH TO THE STOMACH AND RECTUM

As a recognition of changes in medical interest, the Section on Stomatology was discontinued and a new Section on Gastro-Enterology and Proctology was established.

THE WORLD WAR

The war was prominent on the final day of the convention. Physicians were informed that a citizens military training camp had been established at Fort Benjamin Harris, Indiana, to instruct doctors in field hospital and sanitation work. Citizens who wished to volunteer to attend this school could do so by paying $1 in addition to the cost of the uniform.

QUARTERLY CUMULATIVE INDEX MEDICUS

During 1916 the support of the Carnegie Foundation for the *Index Medicus* had been discontinued; as a result this valuable tool for workers in medical research was discontinued. At this time Dr. George H. Simmons, as a result of many conferences in Washington and elsewhere, proposed that the American Medical Association establish an index medicus to be published quarterly and cumulated. This would be a large responsibility for the Association. Dr. Simmons presented his proposal to the Board of Trustees, which authorized him to proceed with the publication. The full story of the QUARTERLY CUMULATIVE INDEX MEDICUS is told in another chapter.

ADMINISTRATION OF PATENTS

A resolution was passed by the House of Delegates authorizing the American Medical Association to accept and administer patents. Dr. E. C. Kendall of the Mayo Clinic had just discovered thyroxin, the active constituent of the thyroid, and wished to award the patent to the American Medical Association. This patent was accepted. At a later date, however, it was realized that the function was quite outside the scope of a body such as the American Medical Association. The patent was returned, and the Association has not since undertaken such an activity.

Dr. Charles Mayo, now President of the Association, offered the Association $25,000 which had been contributed by Mr. R. T. Crane for the discovery of the cause and best cure of infantile paralysis. The Association tentatively accepted the funds and the obligation.

1917

NEW YORK CITY

By 1917 the Scientific Exhibit had grown so greatly that the recommendation was made to the Board of Trustees that there be established a special committee on scientific exhibit. The story of the Scientific Exhibit is told also in another chapter.

In this year action was adopted that all papers read at the annual session be treated as volunteer contributions and that they be published in full in THE JOURNAL or rejected or published in abstract, as might seem best. This step was fundamental in improving the quality of THE JOURNAL.

Petitions had come for the publication of journals devoted to ophthalmology and otolaryngology; the board took these under advisement.

The Committee on Social Insurance had found itself heavily obligated because of the thousands of studies necessary. It indicated a wish for additional funds and also the necessity for a full time executive secretary.

When the Association convened in New York in the midst of the war the President of the Association, Dr. Rupert Blue, Surgeon General of the U. S. Public Health Service, told of the activities in which he had participated in the prosecution of the war. Committees had been set up in the various states to cooperate with the Red Cross. A committee of three, consisting of Drs. Arthur Dean Bevan, Alexander Lambert and J. W. Kerr, had been constituted to report on the best way of utilizing the records and activities of the American Medical Association. Letters had been addressed to the presidents and secretaries of all the component medical societies urging them to secure medical officers for the armed forces.

THE FIRST CHAIRMAN OF THE HOUSE

The first chairman of the House of Delegates, Dr. Hubert Work, presided. In his opening address he announced his concept of the functions of the office. His was a statesmanlike presentation, free from any political connotations. It established the standards for functioning of the speaker of the House of Delegates since that time.

Most of the report of the Board of Trustees was concerned with the problem of publication of the section papers. Their number had become overwhelming; the price of paper had grown so greatly that it was not possible with financial safety to publish all the papers. The Board of Trustees informed the House of Delegates that it had passed the resolution relative to volunteer contributions. The editor had been authorized to refer highly specialized papers to the special journals. The board also announced its decision to publish a journal of ophthalmology and otolaryngology.

THE LIBEL SUIT

Then came a report on the defense against the libel suit, which had lasted thirteen weeks. The result was satisfactory not only by the moral standard but also in its financial aspects. Nevertheless the cost of the trial was so great that the auditor's report showed for the first time in twenty-five years an operating loss in the finances of the Association. Fortunately the expense was met largely out of current receipts without impairing the reserve funds of the Association. Nevertheless the Board said:

> This trial demonstrated the wisdom of having a large reserve fund on which to fall back, for the existence of this fund gave courage to carry on a vigorous defense to a successful end. This leads us to suggest that the reserve fund should be still further increased. In times of adversity the absence of such a fund might badly cripple us or force us to suspend temporarily all altruistic work. Not all years are "fat" with prosperity; "lean" years are bound to come, against which provision must be made. No one can foretell the end of the critical period upon which this country has entered; but it is easy to foresee the possibility of a diminished income to the Association. It is quite possible that a large number—perhaps several thousand—of our Fellows will be called to the front for an indefinite period, during which time it is more than likely that there will be a considerable falling off in the subscriptions to The Journal. Hence it behooves us to husband our resources that there may be no interruption in our more desirable and important activities.

In concluding its report the Board of Trustees presented a memorandum on the death of Philip Mills Jones of San Francisco on Nov. 27, 1916. He had attended a meeting of the Board of Trustees on November 3 and was in his usual good health. Then within three weeks he was dead from pneumonia, and his wife died from the same disease within twenty-four hours. Dr. Philip Mills Jones had become one of the most ardent advocates of clean advertising, although previously favoring a national joint council. He had become so interested in the legal aspect of medical problems that he took up the study of law late in life; in the year previous to his death he had been admitted to the California bar.

THE WAR CHECKS ACTIVITY

As temporary chairman of the Council on Health and Public Instruction, Dr. Frank Billings presented the report which was greatly condensed, occupying now only two pages of The Journal. Dr. Frederick R. Green, who had been most active as secretary of this body, had volunteered for military service and had been given a leave of absence by the Board of Trustees. The demands of the war had greatly curtailed all the activities of the Council. Nevertheless, the committee on social insurance presented a report occupying thirty-five pages under the auspices of Dr. Alexander Lambert, the chairman. Two state commissions—California and Massachusetts—had investigated health insurance and had reported favorably on it. Health insurance measures had been introduced into the legislatures of fourteen other states. Most of the extensive report dealt with conditions in Germany. It considered not only health insurance but old age protection and unemployment insurance. The pattern in foreign countries had been a beginning with voluntary insurance, which proved inadequate, then voluntary insurance subsidized by the state, which, although more successful, was still inadequate and, finally, full compulsory insurance. Poorly concealed throughout this report is a plea for early adoption of compulsory sickness insurance in the United States. For instance, the report said:

> Regarding social insurance as a whole, this country is still in the stage of investigation, but the rapidity with which, after a few years—less than a decade—protection against industrial accident was taken up and adopted shows clearly that when the idea is once understood and grasped how rapidly it appeals to all nationalities, although a few years ago the accident insurance was condemned as un-American and the same adjective is being used against the other forms of social insurance today as they are discussed. It has been a noticeable feature that all official investigations in this country have led to the approval of at least the basic principle in the movement for social insurance. There is no question that the enormous modern industrial development has increased the hazards of the wage earner and has increased also the dependence of a large part of the population on their own physical well-being and working capacity. This country today still possesses the strongest development of individualism, but so great has been the collective development of industry and so strong the collective development of labor that the collective protection of the individual against a universal hazard has found ready and vigorous support.

In concluding its report the Council condemned the *Boston Medical and Surgical Journal* for suggesting that medicine be eliminated from social insurance laws. It felt that the intense reaction in many states against sickness insurance or further expansion of social insurance laws in this country was due to the unjustness and cold blooded methods of unfairness under the workmen's compensation laws. The report said, in part:

> Blind opposition, indignant repudiation, bitter denunciation of these laws is worse than useless; it leads nowhere and it leaves the profession in a position of helplessness if the rising tide of social development sweeps over them. The profession can, through its influence in the community, prevent for a time these laws being passed and it can, by a refusal to cooperate, still further retard them, but in the end the social forces that demand these laws and demand an improvement in the social existence of the great mass of the people of the nation will indignantly force a recalcitrant profession to accept that which is unjust to it and that which is to its detriment.
>
> The profession today, in certain states, is acting the part that our school boy history showed of old King Canute sitting on the seashore bidding the rising tide to stop, and King Canute only got wet for his trouble.

The report ended with a resolution:

> *Resolved,* That the House of Delegates of the American Medical Association in the interests of both the wage earners and the medical profession authorize its Council on Health and Public Instruction to continue to study and to make reports on the future development of social insurance legislation and to cooperate, when possible, in the molding of these laws that the health of the community may be properly safeguarded and the interests of the medical profession protected; and be it further
>
> *Resolved,* That the House of Delegates instruct its Council on Health and Public Instruction to insist that such legislation shall provide for freedom of choice of physician by the insured; payment of the physician in proportion to the amount of work done; the separation of the functions of medical official supervision from the function of daily care of the sick, and adequate representation of the medical profession on the appropriate administrative bodies.

The reference committee expressed its appreciation of this report and recommended the adoption of the resolutions, which recommendation the House of Delegates followed.

This was not a rejection of compulsory sickness insurance; it seems to have been a qualified acceptance. It favored the adoption of compulsory sickness insurance subject to acceptance of the principles related to medical practice which were involved. Behind this report was the influence of Dr. Rubinow. Later came complete repudiation.

THE SECTIONS

Attempts were still being made by the first Council on Scientific Assembly, which included in its membership Drs. E. Starr Judd, chairman, Roger S. Morris, George H. Simmons, J. Shelton Horsley and Alexander R. Craig, to organize and coordinate the work of the sections and to assign them relative importance in the number of papers permitted in each. An attempt was made, in fact, to adopt the system which prevailed in Great Britain by which some sections would meet twice, others as often as six times during the session. The reference committee of the House of Delegates accepted the report of the Council on Scientific Assembly with the exception of that portion which distributed units to the different sections. Some of the representatives of the various sections insisted that two units were too few; three units were made the minimum. Later in the session the Section on Preventive Medicine and Public Health objected to being limited to three units and asked for six units, which the House promptly gave it.

THE WAR

Now came resolutions on participation by the medical profession in the war, on the care of infants and children during the war, and on provision of insignia for medical students so that they could continue their studies without being called cowards and slackers.

Other resolutions concerned the operation of quarantine during the war and the appointment of a food commission to act in an advisory capacity to the government in controlling food supplies during the war.

ORGANIZATION OF ARMY MEDICAL SERVICE

In a statesmanlike address to the House of Delegates, Dr. Frank Billings urged the establishment of a committee of five to formulate resolutions whereby better protection could be given to guarding the health of our soldiers. The position of the medical officer in relationship to officers in the line was not such as made it possible for him to secure action on recommendations definitely concerned with the prevention of epidemics. The suggestion of Dr. Billings was unanimously adopted. Many years passed following World War I, and the same difficulties that caused so much distress at that time arose in World War II.

The House of Delegates gave complete support to the Board of Trustees in establishing new journals to be devoted to otolaryngology and ophthalmology.

AIDING THE DRAFT

A special meeting of the Boards of Trustees was called in October 1917 to consider a proposal submitted by the War Department through the Provost Marshal General requesting the aid of the American Medical Association in organizing medical boards to conduct medical examinations in connection with the draft. The Board of Trustees accepted the invitation to cooperate with the Provost Marshal General as presented in the letter from Lieut. Col. Hugh S. Johnson, Judge Advocate. A committee of three was appointed to cooperate: Drs. Hubert Work, M. L. Harris and E. J. McKnight. The action was submitted by telegram to the members of the House of Delegates. The committee was empowered to call a meeting of the representatives from every state medical association to discuss the selection of suitable men to constitute such advisory boards. The American Medical Association bore the entire cost.

DAVIS MEMORIAL FUND

Dr. William Allen Pusey appeared before the Board and spoke in behalf of combining the funds held to honor the memory of N. S. Davis by the American Medical Association and the Chicago Medical Society, with a view to establishing a lectureship.

THE POLIOMYELITIS PRIZE

Many applicants had applied for the prize of $25,000 offered by Mr. R. T. Crane to any one who would discover the cause and cure of infantile paralysis, but none had presented sufficient evidence to warrant his being given the prize.

WORLD WAR I

On April 7, 1917 The Journal of the American Medical Association noted that war was imminent and called on the medical profession for volunteers.

It published the reports dealing with the organization of the Council of National Defense and of the Committee of American Physicians for Medical Preparedness. Dr. Franklin H. Martin had, according to the reports, been selected by a committee of distinguished physicians as the medical representative on the advisory commission of the Council of National Defense. Dr. Frank F. Simpson had been selected as chief of the medical section of the Council of National Defense. Dr. Franklin H. Martin, as chairman, had created an advisory committee which included Drs. W. C. Gorgas, W. C. Braisted, Rupert Blue, J. R. Kean, W. H. Welch, W. J. Mayo and Frank F. Simpson. Dr. William J. Mayo had, in turn, become chairman of the American Physicians for Medical Preparedness, which had organized a special committee of nine men in each state and, under this, county committees. Obviously in this setup the headquarters organization of the American Medical Association had been rather definitely ignored. When it came to functioning, however, the committee was dependent on THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION as its voice and on the biographic files of the American Medical Association as the one available source for accurate information concerning the physicians of the United States.

In the issue for April 14 THE JOURNAL discussed in many editorials the organization of the medical department of the Army. The advisory commission of the Council of National Defense would have to utilize the county and state medical societies to carry out the mobilization, and THE JOURNAL urged full cooperation. By this time also Dr. Franklin H. Martin had decided to appoint a general medical board to cooperate with him in coordinating civilian medical activities and to advise with regard to fundamental medical problems in relation to the armed forces of the country. This board included a membership of twenty-four, among whom the only representative of the American Medical Association was Dr. George H. Simmons. In the April 14 issue of THE JOURNAL a special department was created entitled "Medical Mobilization and the War." From that time on many pages were given in each issue to military problems.

In the issue for April 21, by which time war had been declared, THE JOURNAL published a form for application for the medical corps of the Army and also for appointment in the officers reserve corps. An editorial called on physicians of the country to meet the needs of the armed forces. There were reports on the work of the general medical board and on the standardization of general medical supplies; again many pages were occupied by information on medical military activities.

By this time THE JOURNAL began a series of articles which were prepared by Colonel McKnight, who had been assigned to the headquarters of the American Medical Association as a liaison officer. The series was entitled "The Medical Officer of the Army." Later the series of articles was collected in book form and widely used in extending knowledge of military activities to the civilian medical profession.

As the weeks went by THE JOURNAL adopted many technics for promoting interest in medical service, appealing with slogans and editorials to the medical profession. There had been an excellent response to the publication of the application blank. Clearly, however, the greatest function of the American Medical Association in mobilization had been the utilization of THE JOURNAL. Its officers had been largely ignored in places of importance in the mobilization for war. Dr. George H. Simmons, the editor, had been assigned a relatively inconspicuous position on the subcommittee which had to do with assignment of personnel.

It would be impossible to overemphasize the tremendous value of THE JOURNAL, with its extensive circulation, as the important medium in maintaining the dissemination of information concerning military activities and in inspiring the medical profession to the utmost fulfilment of its obligation. The names of all physicians who were enrolled and their assignments to camps were promptly recorded. Special articles dealt with almost every phase of military service. The organization of the base hospitals and the enlistment of physicians in their units were constantly recorded. The formation of the medical officers training camps was fully described, and visits were made to these camps for full reporting of their activities. Special articles were published from the officers in charge of the British and French medical departments. THE JOURNAL enlisted in the campaign for conservation of food. One finds, late in 1917, full page photographs of the medical officers training camps and all of the physicians in attendance. Once more began the campaign for adequate rank for physicians. Week by week the news from every medical front was reported. It is doubtful that there could have been any single effort more important in maintaining medical morale than were the many pages assigned by THE JOURNAL to medical military activities. THE JOURNAL published week by week the orders to medical officers. These were carefully systematized according to the individual states from which the officers came. It required an extensive organization in the editorial functions of the Association to carry out these activities. The Army itself developed no mechanism for contact with medical officers, nor did the Navy. THE JOURNAL during World War I published the photograph and biography of every physician who gave his life in the armed forces, and this procedure was followed also in World War II.

In April 1918 the American Medical Association called a war conference of the secretaries of the constituent state associations. By this time the government had realized the necessity of utilizing the American Medical Association more and more in the enrolment of medical officers. The primary purpose of the conference of secretaries was to enlist the necessary physicians to meet the national need.

An extraordinary contribution was publication by THE JOURNAL of June 1, 1918 of a complete list of civilian physicians in military service, with a tabulation of enrolment by counties and states. The Section on Miscellaneous Topics at the annual session in June was devoted wholly to the reconstruction and rehabilitation of disabled soldiers. When the annual session met in Chicago, a special feature was a military meeting held in the Medinah Temple, at that time the largest assembly hall in Chicago. Over this medical military meeting Dr. Arthur Dean Bevan, President of the Association, presided. Addresses were made by Gen. W. C. Gorgas, Sir James Mackenzie, Sir Arbuthnot Lane, Col. Herbert Bruce of the Canadian army, Major Edouard Rist of the French army, Capt. René Sand of the Belgian army, Admiral William C. Braisted, Surgeon General of the Navy, and President Ray

Lyman Wilbur of Stanford University. Dr. Wilbur was especially concerned with food. The final address was made by Major Alexander Lambert, who spoke of the work of the Red Cross.

Another meeting, known as the Patriotic Meeting, was held in the Auditorium Theater. Here Dr. Ludvig Hektoen, president of the Chicago Medical Society, presided, and addresses were made on "Science and the War" by Professor John M. Coulter of the University of Chicago, "The Law and the War" by Judge Charles S. Cutting and "American Ideals" by Bishop Charles P. Anderson.

As the war neared its end, The Journal became more and more concerned with problems of medical education. Fortunately the war ended in November. The brevity of the American participation made unnecessary the serious considerations that disturbed the profession during World War II, when medical education suffered severely. In World War I, 35,000 physicians had participated. Almost immediately with the end of the war, The Journal began calling for the formation of a competent medical reserve corps.

1918

CHICAGO

Early in 1918 the Board of Trustees was mostly concerned with its relationships to the Council on National Defense and to the office of the Provost Marshal. Few activities developed in the American Medical Association. As told elsewhere, Dr. Franklin H. Martin had been alert in hastening to Washington; leadership began and remained with him and leaders of the American College of Surgeons.

A SPANISH JOURNAL

Among new projects brought to the attention of the Board was the possible publication of The Journal of the American Medical Association in Spanish, to be circulated in South and Central American countries. Through negotiations by Dr. George H. Simmons with the Rockefeller Foundation, this project was undertaken; Dr. A. A. Moll was selected as editor and the choice of material was assigned to Dr. Morris Fishbein.

NEUROLOGY AND PSYCHIATRY

The Board of Trustees authorized also the publication of a journal of neurology and psychiatry, and an editorial board was selected for that periodical.

STANDARDIZATION OF HOSPITALS

It was suggested that the Council on Medical Education undertake standardization of hospitals.

AN AUTO EMBLEM

The Board authorized the manufacture and distribution of an automobile emblem for physicians.

WAR SERVICE

The editor and general manager or the secretary were authorized to visit Washington whenever necessary to coordinate more closely the activities of the Association with governmental departments. A special report was made by the war committee, and a resolution was introduced approving the creation of a world war medical conference organization.

THE WAR MEETING

The 1918 war meeting of the Association was held in Chicago in the offices of the American Medical Association. All five members of the Council on Health and Public Instruction and its secretary were in service, and the activities of the council had been limited to routine work. Its report was brief and the entire section on social insurance had disappeared. It is interesting to think what might have happened relating to social insurance if the war had not intervened.

The President, Dr. Charles Mayo, was also in the armed forces. He felt that there was bickering and disturbance in the profession and a lack of harmony, and he urged cooperation in the battle against Germany. The undercurrent of his address referred to the competition between Dr. George H. Simmons and Dr. Franklin H. Martin, although neither was mentioned by name. He pleaded particularly for coordination between the seventeen different government agencies concerned with medicine.

Dr. Hubert Work, chairman of the House of Delegates, spoke briefly on the war situation and announced that he would present later the report of the war committee. He called the selective draft "the colossal achievement of the times," and he paid high tribute to Gen. Enoch H. Crowder for his magnificent conduct of the draft and also to William C. Gorgas, Surgeon General of the Army.

The secretary of the Association, Dr. Alexander R. Craig, reported on the appointment of the war committee and recommended that it be continued so that it might act for the Association in all matters pertaining to placing the Association at the service of the government for the war. He indicated the numerous facilities in the headquarters of the Association which could be useful to the government and how particularly the biographic data had been utilized in finding physicians for the armed forces.

THE PUBLICATIONS

The Board of Trustees emphasized the growth of the publications and emphasized the number of law suits which had been filed against the organization and the manner in which they had been handled in the courts. The active work of the Association in codifying and supplying to the profession and the public information concerning quackery, fraudulent medicines and low standard medical colleges had resulted in threats, intimidation and actual suits. There were six libel suits in sums of $100,000 each.

THE LYDSTON CASE

The Board submitted also a complete record of the case that had been filed by Dr. G. Frank Lydston to oust the trustees of the American Medical Association from office because they had been elected outside the state of Illinois. That case had been decided by the Supreme Court of the state of Illinois in favor of the American Medical Association.

PATENTS

A fundamental decision reported by the Judicial Council objected to the acceptance of a patent by the American Medical Association. It declared against the patenting of a medical discovery for commercial gain, and it said "The ethics of patenting a medical discovery is not overshadowing or affected by the use to which the returns from the sale of the patented medicine may be put." Indeed, the Judicial Council declared that it was unethical for the University of Minnesota to accept patents on medical discoveries and that it would be unethical for the Mayo brothers on their part to consummate an agreement of this kind if they would be patenting a medical discovery and using the commercial proceeds therefrom to increase a fund given to the university by them.

The House of Delegates rejected the recommendation of the Judicial Council relative to patents, believing that the Mayo brothers had made their offer in good faith and in the spirit of altruism. It was felt that whatever the University of Minnesota did was a problem for the University of Minnesota.

A NURSE SHORTAGE

Already in World War I there began to be a shortage of nurses, and a resolution was submitted requesting the establishment of a committee to consider the whole question of registering and training nurses with a view to standardizing and simplifying the requirements and with a view to establishing a grade of practical nurses who would receive smaller compensation and take care of the sick, thus relieving graduate nurses for war work.

The meeting approved the commissioning of women physicians in the Army. A resolution was adopted, as offered by Dr. John Ridlon, urging universal military training before the right of suffrage was granted.

In 1918 an amendment to the Constitution had provided for changing the name of "chairman" and "vice chairman" of the House of Delegates to "speaker" and "vice speaker."

At the 1918 meeting Dr. Charles H. Mayo, who was at that time the President of the Association, introduced a resolution into the House of Delegates providing for an ad interim committee to deal with emergency problems, this committee to consist of the President, the president-elect, the chairman of the House of Delegates, the secretary of the Association, the last two living retiring presidents and the chairman of the Board of Trustees. He also proposed that the President of the American Medical Association be authorized to appoint members of committees not provided for by the House of Delegates or the Board of Trustees and that their work be passed on by the ad interim committee. The reference committee on amendments to the Constitution and By-Laws approved this amendment with the exception that they put the last two living ex-presidents on the committee and made it possible for committees appointed by the President to have official existence only until the next meeting of the House of Delegates.

In November 1918 a meeting of the war committee convened in Washington and was reconstituted as a meeting of the Board of Trustees. Since the Armistice had been signed, the war committee was instructed to take steps for using the American Medical Association to constitute a real medical reserve corps, and a special committee was developed for that purpose. When World War II came, the reserve corps had some 18,000 members, but unfortunately 9,000 were incapable of giving active service.

The Association planned for a Victory Meeting in 1919 with distinguished guests from abroad. It was suggested that the Department of State issue invitations to the allied nations to send delegates. Requests were made particularly to invite physicians from the South American nations.

1919

ATLANTIC CITY

Dr. Frank Billings reported for the committee which had been appointed to consider standardization of hospitals that it seemed desirable that such standardization be undertaken in cooperation with the American College of Surgeons. It was felt that it would be desirable to employ a full time man to do this work

SOCIAL INSURANCE

Then came the question of social and health insurance. A special message had come from the president of the Pensylvania State Medical Association and from Dr. Alexander Lambert indicating that the situation was becoming pressing. The statement by Dr. Lambert attacked particularly Dr. Edward H. Ochsner of Chicago, who had been the leading opponent of compulsory sickness insurance. Dr. Lambert attacked the Insurance Economic Society of America as the principal camouflage organization now conducting a vigorous campaign against social insurance. Dr. Wendell Phillips called attention to an editorial which had appeared in THE JOURNAL for Feb. 1, 1919 entitled "The Failure of Compulsory Health Insurance." He felt that it did not present the entire subject. Dr. Alexander Lambert, now president-elect of the Association, called attention to the eight pamphlets already published and to the four basic points which he felt must be included in any social insurance system which would be approved by the medical profession.

A SURGICAL JOURNAL

Now that the war had passed there came again a call for the publication of a special journal dealing with the philosophy of surgery in contradistinction to surgical technic. Dr. Lambert urged that such a journal would not be in competition with any journal then being published.

Conferences began to be held between representatives of the American Medical Association and the American College of Surgeons on the standardization of hospitals with a view to cooperation and avoidance of duplication.

In 1918 Dr. Frank Billings, who had served in many capacities, including the presidency of the Association, was elected to the Board of Trustees and his place on the Council on Health and Public Instruction was given to Dr. Ludvig Hektoen.

The Spanish journal had been conducted for three months with considerable success. The Association had distinguished itself in defending a suit brought by Jenner Medical Colleges for $500,000 damages.

It was felt desirable that the Board of Trustees publish regularly a digest of its minutes in THE JOURNAL and that it would have served a good effect on the medical profession if the report of the conference with the American College of Surgeons had been given adequate publicity in THE JOURNAL.

It became clear that little could be expected in the way of having delegates from foreign countries at the Victory Meeting. Response had been poor, and the secretary of the Association was authorized to send cables to various governments requesting attendance of foreign guests at the 1919 meeting.

The speaker of the House of Delegates made a long address in which he discussed the problems created by the war and the return of men from the war. He recognized the growth of groups of physicians in practice and the evolution of the hospital. He predicted that the greatest future concern of the Association might be in its direction and oversight of hospitals. He suggested the possible establishment of a council on hospitals to be concerned with control of such organizations and with a view to possible elimination of the joint survey of hospitals conducted by the American Medical Association and the American College of Surgeons. He recognized the problems created by the increasing length of the curriculum, and he feared that the duration of medical education was becoming too great. He was equally concerned with the difficulty of securing competent nurses at reasonable costs, and he viewed with alarm the tendency toward specialization and the disappearance of the general practitioner. He conceived it to be the duty of the American Medical Association to assure to the public qualified physicians, nurses and standardized hospitals at prices it could afford to pay. He spoke also of problems in the field of physical education, noting that 30 per cent of registrants appearing before local boards were rejected for military service—a situation which was still a matter of concern in 1946. He was especially concerned with the problems of dentistry as they related to the draft, and he thought the time ripe to give serious consideration to provision of medical care in rural areas.

Dr. Arthur Dean Bevan, who was President of the Association, had been chosen no doubt in recognition not only of his eminence in the field of surgery but also for his many years of leadership in the Council on Medical Education. Both Dr. Work and Dr. Bevan called attention to the manner in which physicians had pledged themselves to the nation for service. He indicated, however, that there must be much closer relationship between the national organization and the individual state organizations. Through the Council on Medical Education a national conference on hospital problems had been developed; this had been of great service through the years in clarifying problems in the hospital field. Dr. Bevan recognized the prominence of The Journal but he urged again particularly a periodical to be devoted to surgery. As will be seen later, this intensified the competition between the Association and the American College of Surgeons. Dr. Bevan felt that the publication of a surgical journal by the American Medical Association would merely tend to improve all other surgical publications in the field.

In his address as president-elect, Dr. Alexander Lambert announced that he had but two recommendations to make. He urged first a journal on surgery and, second, a popular journal in the field of health—thus intensifying the drive toward such a publication, which had been going on for many years. More particularly he then devoted himself wholly to problems of narcotic addiction; he recommended resolutions leading toward a national conference on the control of narcotic drugs.

The secretary of the Association, Dr. Alexander R. Craig, was concerned with the manner in which physicians returning from the war were being received by their communities.

The introduction by the American College of Surgeons of the letters F.A.C.S. to designate its members had raised the question of a similar designation for fellows of the American Medical Association. The secretary of the Association, therefore, proposed a variety of designations to indicate various qualifications of membership in the American Medical Association.

The Board of Trustees indicated great progress, first by the fact that there had been no loss of membership or subscription to The Journal during the war. The Spanish edition had been established and had reached a circulation of more than 1,400. The Quarterly Cumulative Index Medicus was operating at a small loss. The Association had been successful in all its law suits. The board announced the decision to develop a new building by adding to its quarters.

At this time the Judicial Council proposed amendments which would more definitely define membership and fellowship in the American Medical Association and which would clarify its wording.

COUNCIL ON HEALTH AND PUBLIC INSTRUCTION

Since the Council on Health and Public Instruction had been relatively inactive during the war because its secretary and most of its members had been in the military service, the chairman found it desirable at this time to present a brief history of the work of the Council since its origin. Since that council was discontinued some years later, when its activities were turned over to a number of bureaus, it is well to read that summary:

> The Council on Health and Public Instruction was organized at St. Louis in 1910. During the reorganization period of the Association from 1902 to 1910 many independent committees had been created dealing with closely related subjects but without any coordination or definite division of functions or jurisdiction. At the 1909 session the Section on Hygiene and Sanitary Science asked the House of Delegates to create a permanent council on these subjects. The reference committee to which this request was referred called attention to the close relation existing between public education, medical and public health legislation and the development of hygiene and sanitation and recommended the appointment of a committee to consider the advisability of combining the functions of legislation, public instruction, organization and public sanitation in a permanent council. This committee was appointed and reported the following year, recommending the establishment of such a permanent council. The Council on Health and Public Instruction was accordingly created and appointed in June 1910 and held its first meeting and organized in July of the same year. In it were merged the old Committees on Medical Legislation, Public Instruction on Medical Subjects, Defense of Medical Research, Organization, Uniform Regulation of Membership, Visual Standards of Pilots, Public Health Education, Prevention of Blindness and Postgraduate Study. In 1911 the work of the Council consisted in the promotion of the work of Dr. J. N. McCormack, at that time engaged in organization work for the Association; in the development of a series of fifteen pamphlets on the Defense of Medical Research, which, in addition to thirteen already published, formed a standard series of twenty-eight monographs on this subject, and in the development of a bureau on medical legislation by which it was hoped some of the problems in this field could be solved and in studying the problem of public education by state boards and other agencies through popular pamphlets.
>
> At the next session, in 1912, the Council reported that a Press Bureau had been organized and conducted during the past year by which regular press bulletins had been sent to approximately 5,000 daily newspapers each week; the Speakers' Bureau had been organized and in the three months of its existence had supplied speakers for forty-four meetings; nine pamphlets on various public health subjects had been prepared, printed and distributed; a Handbook for Speakers on Public Health had been compiled, printed and distributed to the speakers of the Bureau. The Council also reported the organization, through cooperation with the National Electric Light Association and the American Institute of Electrical Engineers, of the Committee on Resuscitation after Electrical Shock; of the appointment, in cooperation with the National Education Association, of a Joint Committee on Medical Expert Testimony, consisting of representatives of the American Medical Associa-

tion, the American Bar Association and the Commissioners on Uniform Laws; of a Committee on Rural Sanitation consisting of representatives of the American Medical Association, the Association of Railway Surgeons and the Conference of State and Provincial Boards of Health; of a Committee on Vital Statistics Legislation consisting of representatives of the American Medical Association, the American Public Health Association, the American Bar Association, Commissioners on Uniform Laws and the Bureau of the Census. In addition the Council had done much work along legislative lines and had represented the Association in a campaign for the establishment of a national department of health.

In 1913 the Council reported the continuation of these activities, showing that speakers had been furnished for 213 meetings during the year; that fourteen pamphlets had been prepared and distributed, and that the various subcommittees of the Council had been functioning successfully during the year. A Committee on Resuscitation from Mine Gases, as the successor of the Committee on Resuscitation after Electrical Shock, had been created at the request of the Federal Bureau of Mines. These committees had standardized the methods of artificial respiration and the treatment of the drowned and those suffering from gas, electric shock, and so on..

In 1914, after four years of existence, the Council presented to the House of Delegates a definite program in which it endeavored to formulate the duties and activities of the organized medical profession in the public health field. In outlining such a program the Council assumed that the primary object of its existence was to place before the profession and the public of the United States the objects, purposes and work of the organized medical profession as represented by the American Medical Association and its constituent state and component county societies, so as to secure public support and endorsement of our efforts for the improvement of public health conditions in the United States. Three general lines of action were accordingly recommended. These were:

1. A thorough investigation of present public health conditions in the United States with the view to securing more accurate information on all phases of the public health problem than is now available.

2. Education of the public by every possible means in order that the people may understand the enormous advances in scientific medical knowledge during the last generation and the possibilities of utilizing such knowledge in the prevention of disease, the reduction of the death rate and the prolongation of human life.

3. The crystallizing of such educated sentiment in necessary public health laws which will render possible the conservation of human life commensurate with our advancing knowledge and will render such laws effective through the only force available in this country, namely educated and enlightened public opinion.

Under the first head, namely the investigation of the present public health situation, need for additional knowledge was subdivided into four classes: (*a*) public health activities of the federal government, (*b*) state public health activities, (*c*) municipal health organization and (*d*) voluntary public health organization.

Under the second head, the education of the public, the Council reported the continuation of the Press Bureau, forty-two bulletins having been sent to 4,900 newspapers at a total cost of approximately $2,300. The Speakers' Bureau had been maintained during the year, speakers had been furnished for 133 meetings at a total cost of approximately $1,900, and a standard set of public health pamphlets had been prepared and published for the use of state boards. In addition, a series of twenty pamphlets on Conservation of Vision had been prepared and issued by the subcommittee on this subject. This set of pamphlets has remained in use ever since and has been recognized as a standard in this field. A series of six pamphlets on cancer and its prevention had also been prepared and published. The total number of pamphlets issued during the year was 57,250.

In 1915 the Council reported the continuation of its program, particularly the carrying on of a comparative study of state public health activities by Dr. Charles V. Chapin, health commissioner of Providence, R. I., as the special representative of the Council. Dr. Chapin's report was the first effort to collect data on state health activities with a view to the ultimate standardization and classification of state public health work. Regarding voluntary public health activities, the Council endeavored through a conference of representatives of the various voluntary organizations held in New York on March 13, 1915 to coordinate the numerous organizations in this field. Along educational lines, the Council reported that, at the direction of the general manager, the mailing list of the Press Bulletin had been reduced to 2,200. Owing to the limited appropriation, the amount available for the Speakers' Bureau had been limited to $1,000. For this amount speakers had been furnished for 151 meetings, an average expense of $9.80 a meeting. During the year 285,400 pamphlets have been printed and distributed.

In 1916 the Council reported further development of its program, including the publication of Dr. Chapin's Report on State Public Health Work, with a rating sheet of the forty-eight state health organizations showing their comparative standing in different lines of state public health work, their appropriations, expenditures, etc. A preliminary edition of 1,000 copies of this report was distributed to members of state boards of health and officers of the Association for criticism and suggestions, and the Council expressed the hope that at the end of two or three years a second survey might be made for confirmatory and comparative purposes. Owing to reduced appropriations the Press Bulletin had been suspended, and the plan of the Speakers' Bureau had been modified by asking local organizations to pay the expenses of speakers instead of having these expenses borne by the Association. During the year 1,133,500 pamphlets had been printed and distributed. Cooperative work had been carried on through the Elizabeth McCormick Memorial Fund and the dry-goods stores of the country for child welfare.

Viewing the situation after the war, the Council thought it inadvisable to continue its press bureau and its speakers' bureau since those functions had been developed by other agencies. It proposed to continue the publication of useful pamphlets. It felt that the control of voluntary health organizations was a problem not for the Council but more particularly for the American Public Health Association, which had recently organized a council of representatives of fifty-seven different national public health organizations. It proposed, therefore, to limit its work largely to the routine work of the secretary's office, continuation of the section on legal medicine and medical legislation, and a survey of public health activities of national, state and municipal, governmental and voluntary agencies. The final section of the report, which was issued under Dr. Victor C. Vaughan as chairman, with Dr. Frederick R. Green as secretary, dealt with social insurance. This report reviewed the existing status of legislation in the field and expressed the point of view of the medical profession in positive terms:

> The attitude of the majority of physicians up to date has been one of unqualified and often unreasoning opposition, without any effort to study the question or to consider the arguments put forward in favor of the proposed plan. Unreasoning opposition or sweeping and often erroneous general arguments against the measure will not prevent its adoption nor will it enhance the influence of physicians. It is of the utmost importance to the medical profession at present that we give this question the most careful, painstaking, patient and disinterested study, that we qualify ourselves as authorities instead of allowing this function to be exercised by the active proponents of social

> insurance. To this end it is particularly necessary that we study this question dispassionately and critically, discriminating between fundamental principles and nonessential details.

The Council recognized four possible solutions for the problem of illness among persons of low income: (1) increasing the income, (2) reducing the amount of sickness, (3) distributing the costs of sickness among the individual, the industry and the state, and (4) doing nothing. These were classed as the economic remedy, the state public health remedy, social insurance and no remedy at all.

It was recognized that extensive studies would be required from an economic point of view to answer many of the questions in the field concerned. The Council recommended that the House of Delegates give most careful study to the report of its subcommittee on social insurance.

The report of the subcommittee on social insurance leaned largely on statistics that were being developed by insurance companies and by the U. S. Public Health Service. It endeavored to assess the responsibility for sickness in its various proportions to the individual, the community and industry. It discussed the relationships between sickness and economic distress, quoting again largely from such writers as the Webbs, Edward T. Devine, Michael Davis and little at all from writers opposed to state controlled methods of medical care.

The final section of the report was an analysis of the relationship of the medical profession to the problems of social insurance.

The committee seemed to believe that a choice was necessarily between state medicine and health insurance. It recognized the evils prevailing in the plans of other countries and recommended that our medical profession learn from the difficulties that prevailed in England and Germany. It felt that the decision would rest not with the medical profession but with economic groups and forces outside the medical profession. Thus it said:

> Your committee does not deem that it is its duty to bring forward at this time a method thoroughly worked out in all detail of medical practice under any sickness insurance scheme. In its previous reports it has gone fully into the methods of payment of physicians under such acts. It has pointed out the mistakes made in the administration of medical service by the insurance laws abroad. It must further be emphasized that it is not a question for the decision of the medical profession whether or not these laws shall be put in force. That is a question for economic groups and forces outside of the medical profession. It will be decided when labor and industry agree together sufficiently to demand it of the legislative bodies of the various states. It is, however, of the utmost importance for the medical profession to be ready with constructive suggestions, to meet labor and industry halfway and show to them how the profession may give a greatly improved service to the wage earners and receive a just remuneration in return, and the great mass of unremunerative medical charity may cease to exist. It is also for the profession to decide whether or not it wishes to carry on its existence under some form of sickness insurance or under some method of state medicine. That choice must inevitably be made.

The conclusion was, however, simply a recommendation for further study and for appearance by physicians before all state legislatures having these questions before them so that the point of view of medicine could be adequately presented. This report was signed by four names: Drs. Alexander Lambert, M. L. Harris, F. L. Van Sickle and S. S. Goldwater.

MULTIPLE RESOLUTIONS

By this time it was apparent that so many actions were being taken in the organization and development of the Association that some codification was needed. A resolution was introduced requesting the secretary of the Association to collect all resolutions passed in the previous five years, to index them properly and to add new resolutions as they developed. The resolution was passed with simply an amendment that ten years be codified instead of five.

SOCIAL INSURANCE

The report on social insurance was referred to a reference committee which included Dr. Thomas S. Cullen, Maryland, as chairman, and Drs. Clarence Pierson, Louisiana, and Charles E. Humiston, Illinois. The committee recommended that every member of the House read the report in full. It recognized the stupendous character of the problem. It commended the committee on refraining from making any definite recommendations. Especially, however, it recognized the political character of the situation. It concluded its report by recommending a change in the By-Laws which would make the Reference Committee on Legislation and Political Action instead a Reference Committee on Legislation and Public Relations. The committee said:

> This change is deemed advisable at this time, as the term political action has in some quarters been thought to refer to politics. In the words of Confucius, "Avoid the very appearance of evil. Do not stoop to tie your shoes in your neighbor's melon patch."

SPECIALIZATION

At this session of the Association there suddenly arose a definite recognition of the rise of specialization versus general practice; a resolution was introduced that the House of Delegates encourage the designation of the practice of general medicine or family physician as a distinct and dignified specialty and that the Council on Medical Education consider the possibility of establishing a definite curriculum leading to the degree of practice of this specialty which would materially shorten the course. The House of Delegates referred these to the Council on Medical Education.

THE SPEAKER

When the elections came before the House of Delegates on the concluding day of the session, an unusual situation arose in the proposal of nomination of the speaker for the presidency. A number of the parliamentarians had studied the Constitution and By-Laws and voiced their opinions to the effect that the speaker was not a member of the House of Delegates and that he was therefore eligible. A motion was taken to the effect that the speaker be considered eligible and the motion passed. Then Admiral William C. Braisted of the U. S. Navy was nominated for the presidency and Dr. Hubert Work announced that he was not even a tentative candidate. Admiral Braisted was elected unanimously to the presidency of the Association.

A number of foreign guests had come to the meeting which had been declared a Victory Meeting for the Association. These included six from Belgium, eight from England, three from France, two from China, three from Japan, four from Cuba, one from Norway and one from Sweden. All were elected to Honorary Fellowship in the American Medical Association.

DAYLIGHT SAVING TIME

As the session ended, the Congress of the United States was proposing to repeal the Daylight Saving Act. The House of Delegates officially opposed the repeal of the act and expressed its opinion of daylight saving as follows:

> The national experience with the Daylight Saving Act during the past two years has shown in the opinion of the committee that the action of this bill has been wholly beneficial, not only has it added to the total of national health by lengthened hours of recreation in the open air, but it is the belief of the committee that notable economic savings have been made in the use of fuel, thereby materially assisting the conservation of national resources, which still is and always will be essential.

BOARD NEEDS MORE MEETINGS

By this time the multiple affairs of the Association had become so great that the Board of Trustees found it impossible to handle them in the amount of time allotted to its meetings. The Board had been accustomed to meet but twice each year—once in February and once at the time of the annual session. Most of the members of the Board were certain that there ought to be more frequent meetings, primarily because too much opposition was focusing itself on the editor and general manager and that it was unfair to put all the responsibility on the manager. It was felt that the Board of Trustees should meet quarterly and that there ought to be an executive committee which would meet regularly in order to take some of the burden from the editor and the general manager. When Dr. George S. Simmons was asked for his opinion, he pointed out that it was at his earnest suggestion that more frequent meetings of the Board were being held. He said that a Board of Trustees consisting of nine men in session once every three months would not do much toward relieving the general manager, or rather the editor, of responsibility; that it is not the general manager, but the editor, that is criticized. He stated that we have a journal second to none in the world, a journal that is a power in the field of medicine, and yet if the editor turns down a paper written by some influential man it has its effect; that what the manager—the editor—wants is some one to shoulder a little of the responsibility—of the blame. He mentioned that there is not as much criticism today as there was fifteen years ago but that there is bound to be some—that it may die down for a time but that it will spring up again. He urged the appointment of a committee of three, living within a reasonable distance of Chicago, to meet once a month—not once in three months—which should act on matters of importance that are coming up all the time and assume part of the editor's responsibility. He stated that it is the editor's position that should be supported.

As a result of these actions the board decided on a technic which would involve four meetings of the full board annually and the meetings of the executive committee once each month—a procedure which has been followed since that time.

DERMATOLOGY JOURNAL

Petitions now had come for a journal in the field of dermatology. For some time the *Journal of Cutaneous Diseases* had been printed in the headquarters office of the American Medical Association and it was felt that publication by the Association would solve many of its financial and editorial problems.

EXECUTIVE COMMITTEE

The first Executive Committee of the Board of Trustees included Drs. Frank Billings (chairman), W. T. Sarles and A. R. Mitchell.

Following the annual session in June of 1919 the Executive Committee met and assumed as its first responsibility advice to the editor relative to passing on papers which had been marked for publication in the Transactions only. THE JOURNAL had begun publishing abstracts from German medical periodicals and Dr. George W. Crile, in association with Drs. F. E. Bunts and W. E. Lower in Cleveland, were opposed to giving any recognition to Germans or German literature. There had been an extensive correspondence on the subject. Dr. Crile was adamant in refusing to countenance any relationships whatever with Germans or any recognition of their science. The Executive Committee of the Board of Trustees agreed with the editor that anything of real importance appearing in the *German journals should be brought to the attention of* the medical profession.

NEW EDITORIAL BOARDS

The Board of Trustees during this year established editorial boards for the ARCHIVES OF DERMATOLOGY AND SYPHILOLOGY and for the ARCHIVES OF SURGERY.

THE STERNBERG BIOGRAPHY

There was also the problem of printing the biography of General Sternberg, which had been written by Mrs. Sternberg, the costs to be offset by Mrs. Sternberg, and it was agreed to undertake this publication with the understanding that if there were any profits they would be divided equally with Mrs. Sternberg.

WAR BOOKS

At that time the American Medical Association endeavored to get distribution to the medical profession of books which had been printed during the war for the use of medical officers.

It was pointed out by Dr. Frank Billings that he had learned that there were no books on hand but that even if there were any they would be government property and could not be distributed. However, as the nation entered World War II some 8,000 copies of the anatomy prepared during World War I were found in a warehouse on Long Island.

The Ad Interim Committee which had been created during the war to consider emergencies arising during the war presented to the Board of Trustees of the Association an extensive letter from the President of the Association, Dr. Alexander Lambert, which he had received from Gen. Merritt W. Ireland concerning the possibility of deriving some lessons from the experience in the war. It was proposed that a circular letter be sent to all men who had been actually in service and some means be provided for continuing the instruction of men in the medical reserve. At that time Dr. Billings explained some of the problems confronting the medical department of the Army, including representation of the medical department on the general staff, control by the medical department of its own personnel, control by the medical department of supplies, building of hospitals and camps, recognition of the importance of sanitation and preventive medicine in the Army, military medical teaching and suitable recognition of qualifications of officers.

As the year went on there came a request from a group of obstetricians to take over the *American Journal of Obstetrics and Diseases of Women and Children*, but it was decided that the Association already had enough periodicals in hand.

(To be continued)

Clinical Notes, Suggestions and New Instruments

REACTIONS TO PENICILLIN

Procaine Hydrochloride Intravenously in the Treatment of Reactions Similar to Serum Sickness

SIDNEY DRESSLER, M.D.
and
RALPH E. DWORK, M.D.
Denver

Numerous reports have appeared in the literature of reactions similar to serum sickness and of other reactions to penicillin. These reactions have been variously treated with epinephrine, Benadryl hydrochloride (beta-dimethylaminoethyl benzohydryl ether hydrochloride), calcium gluconate, ephedrine and other preparations. Recently, State and Wangensteen[1] reported the use of procaine hydrochloride intravenously for actual serum sickness, and a similar case was cited by Appelbaum and others.[2] Prompted by these reports we are adding a case of successful treatment with procaine hydrochloride for a reaction similar to serum sickness resulting from penicillin therapy.

REPORT OF A CASE

E. B., a white woman aged 42, was admitted on June 17, 1946 with a history of pulmonary tuberculosis for the past ten years. She had previously been treated with artificial pneumothorax, which adequately controlled the disease. Reactivation of the tuberculous process caused her to seek readmission. Roentgenologic examination revealed a cavity in the upper lobe of the left lung, for which collapse therapy was advised. Reinstitution of pneumothorax having failed, a classic extrapleural paravertebral thoracoplasty was performed on the left side on Aug. 13, 1946. The patient was given 20,000 units of penicillin every three hours, intramuscularly, for three days prior to the operation, and the dosage was continued for seven days postoperatively. In the course of the surgical operation, 3 Gm. of sulfathiazole crystals was sprinkled into the wound. In the immediate postoperative period the patient received meperidine hydrochloride (Demerol) and morphine for pain, with occasional doses of barbiturate preparations for sleep and nervousness. On the second postoperative day some intestinal stasis with distention was noted. This was successfully combated by use of a rectal tube and by the injection of 1 cc. of neostigmine methylsulfate. Otherwise, the convalescence was uneventful.

On Sept. 9, 1946 a second stage three rib thoracoplasty was performed. Again 3 Gm. of sulfathiazole crystals was sprinkled into the wound. Penicillin therapy had been started three days before surgical intervention in the same dosage as previously, with no untoward changes noted. During the night after the operation the patient's temperature rose to 99.4 F., and giant urticarial wheals appeared on the face, arms and legs. Her medication up to this time had consisted of penicillin and meperidine. On Sept. 10 Benadryl was given twice in divided doses of 50 mg. each for the urticaria. This was followed by prompt relief of the itching and subsidence of the urticaria during the day. Penicillin therapy was maintained.

On the morning of Sept. 11 the patient complained of a sore throat, and the temperature rose to 100 F. Detailed inspection of the throat revealed no abnormality. By 1 p. m. the temperature had risen to 102 F., and a finely patterned macular rash appeared on the abdomen, on the buttocks and on both forearms and thighs. This rash faded on pressure. There was generalized pruritus. Benadryl, 100 mg., was administered with complete relief of the itching and with fading of the rash on the abdomen. The patient's temperature continued to rise, however, to 103 F. Examination of the blood at this time revealed 18,000 white blood cells, 92 per cent of which were polymorphonuclear leukocytes with a decided shift to the left. Administration of penicillin was discontinued.

By the morning of Sept. 12 her temperature was 103.4 F.; she had a sore throat and tenderness over both temporomandibular joints. The patient could not open her mouth and remarked on the generalized muscular and articular pain and tenderness. The rash previously described appeared again over the chest and abdomen, and in addition the arms and thighs showed small splinter hemorrhagic spots, which faded on pressure. There was no nuchal rigidity or Kernig or Brudzinski signs. Inspection of the wound revealed normal conditions. The mouth was opened forcibly, and the throat was inspected but was completely negative. The administration of Benadryl, 100 mg., again gave relief of itching and some fading of the rash on chest and abdomen but not of that on the forearms and thighs. The arthralgia and the soreness of the muscles were unrelieved. Calcium gluconate and epinephrine were given without effect.

At 1:30 p. m. an infusion of 1 Gm. of procaine hydrochloride in 500 cc. of isotonic solution of sodium chloride (0.2 per cent) was begun by the slow drip method. Within ten minutes after the start of the infusion there was great relief of the arthralgia and trismus, and the rash began to fade.

By 8 p. m. the rash had disappeared completely. The mouth could now be voluntarily opened sufficiently for inspection. The pain of the throat was no longer present. The temperature had dropped to 102.4 F. There was a moderate amount of abdominal distention present, which was relieved by use of the rectal tube and by the administration of 1 cc. of neostigmine methylsulfate. By morning neither arthralgia nor rash was present. The temperature had fallen to 101 F. The abdomen was considerably deflated. Within the next twenty-four hours the temperature returned to normal and the patient was symptom free; convalescence thereafter was uneventful.

Nine days after the second stage of the surgical intervention, cutaneous patch tests with penicillin were negative. Conjunctival instillations or subcutaneous skin tests were considered too dangerous to attempt.

COMMENT

During the latter part of the war, in spite of the extensive use of penicillin, there were only rare reports of any reactions to penicillin, but more recently reports have appeared of such reactions.[3]

Penicillin is used routinely in preoperative and postoperative therapy for patients requiring thoracoplasty. A number of urticarial reactions have appeared, but this is our first case of a reaction similar to serum sickness. Prompted by the striking results reported by others on the use of procaine hydrochloride to relieve the arthralgia, we used it in the case here described with gratifying results. As others have pointed out, the mode of action of this drug is highly conjectural.

The use of skin tests on our patient gave a negative result. Others have reported similar observations. Apparently, fairly large doses of penicillin, as high as 1,500 units, are required to give reliable results.

We are encouraged by the results obtained in this case to add it to the growing number of similar reactions which have been successfully treated and to call it to the attention of others.

From the National Jewish Hospital, Dr. Allan Hurst, Medical Director, and the University of Colorado School of Medicine.

Council on Pharmacy and Chemistry

REPORT OF THE COUNCIL

The Council has authorized publication of the following report.
AUSTIN SMITH, M.D., *Secretary.*

ANNUAL MEETING OF THE COUNCIL ON PHARMACY AND CHEMISTRY

The Council convened at 9:45 a. m., Nov. 1, 1946, for a meeting with the representatives of the American Pharmaceutical Manufacturers' Association and the American Drug Manufacturers' Association to discuss the new rules adopted by the Council. All members were present with the exception of Dr. David Barr.

The conference was characterized by a spirit of good will and cooperation sparked by a frank statement of the manufacturers' representatives on points of difficulty in application of the rules and other problems related to the Council. Full agreement was reached on all essential points, and the resulting modifications will be published in the near future.

The Council reconvened at 2:10 p. m. on Friday. All Council members present at the morning session were at this session. In addition there were present as guests for part or all of the meeting Dr. Charles E. Reed and Dr. Arno Viehoever of the Technical Industrial Intelligence Division of the Department of Commerce, Dr. E. E. Irons of the Board of Trustees, Dr. Donald Wallace of the Council on Dental Therapeutics of the American Dental Association, Dr. Ralph M. Waters and Dr. Windsor Cutting of the Therapeutic Trials Committee, Dr. E. Fullerton Cook of the Pharmacopeial Revision Committee, Dr. Milton Veldee of the National Institute of Health, and Dr. R. P. Fischelis of the American Pharmaceutical Association.

The first order of business was adoption of a motion that the Secretary of the Council be authorized to prepare a redrafting of the rules incorporating the changes agreed on at the morning meeting with the manufacturers' representatives. The Council then proceeded to the consideration of the prepared agendum.

Warnings on Labels of Prescribed Drugs.—The Council considered the fact that under the Food, Drug and Cosmetic Act pharmacists may be required to write or insert on the label of a prescribed article a warning concerning its danger even though the physician has not written such a warning on the prescription. After extensive discussion the Council voted to ask the Board of Trustees to make every effort through available channels to increase the sense of responsibility of physicians in the prescription and administration of drugs known to have inherent dangers for their patients. (The Board of Trustees has since requested a conference to be called by the Council with representatives from several agencies to determine how this sense of responsibility may be best developed.)

Human Plasma and Plasma.—After a considerable discussion of the postwar status of blood and blood derivatives, the consensus was that a definitive report is needed for the information of the medical profession and interested organizations. It was agreed that such a report be prepared under the Council's sponsorship for publication in THE JOURNAL. (Such a report is now under way.)

Products That May Be Advertised to the Public.—Under the Council's rules certain categories of products may be accepted for advertising to the public after special consideration of the specific preparation involved. The Council considered the feasibility of adding to this list and voted that such a list of additional categories be drawn up for Council consideration by an appropriate consultant or committee of consultants as to the desirability of releasing such classes of articles for lay advertising.

Report of the Therapeutic Trials Committee.—The Secretary of the Committee, Dr. Walton Van Winkle, reported that the Committee is now organized and has started work by way of obtaining information with regard to available clinical investigators and facilities. He discussed informally some projects which the Committee has tentatively considered. It was reported that Dr. Chester Keefer was elected and had consented to act as chairman and Dr. Stuart Mudd as vice chairman of the Committee.

Atomic Fission Products.—The Council considered the question of the need at the present moment for some body of semiofficial character, preferably, to be advisory to suitable governmental and commercial agencies on the distribution of radioactive isotopes and similar materials, both for experimental study and for actual use. After considerable discussion the Council voted that the Secretary be authorized to look into the circumstances surrounding this question and report on the possibility for the Council's advisory participation in this work.

Special Representation on the Council and the Therapeutic Trials Committee.—The Council considered a proposal that a representative or representatives of a specialized group of physicians be included in the membership of the Council. In the discussion of this question it was pointed out that the Council is a judicial rather than a representative body. In other words, it passes judgment on evidence offered for medicinal preparations proposed by manufacturers for inclusion in New and Nonofficial Remedies. In arriving at such judgment there has always been available to the Council the assistance of specialists in medical or other fields and the Council has always taken advantage of this fact. It was therefore the consensus that there is no necessity for having representatives of any particular group specialists as members of the Council.

Demerol Hydrochloride.—The Council considered the question of the addictive properties of this drug. It was pointed out that, in accepting the drug, the Council required the manufacturer to mention the possibility of addiction. The Council voted to study the problem further and to issue a report when further evidence becomes available.

Accepted Dosage Forms.—The attention of the Council was called to a letter received from a physician who pointed out that occasionally in prescribing a new drug, incorporating it as part of a prescription, he found it impossible for the pharmacist to fill it with the use of the drug in its bulk or powdered form, the agent being available only in tablets or perhaps capsules. The physician proposed that the Council amend its rules to require manufacturers to market the bulk form of an accepted drug as one of the dosage forms. It was pointed out that the Council does require, in the case of nonofficial mixtures, that the basic substance be presented and considered by the Council before acceptance of specific dosage forms. However, not every manufacturer makes the bulk drug available as a dosage form, and the Council felt that it was not feasible to make the requested arbitrary requirement concerning the actual marketed forms of accepted drugs, although it believed that manufacturers might be made aware of the dispensing problem where indicated.

Significance of the Council's Seal of Acceptance.—It has always been held that the use of the Council seal signified only that the product conforms to the rules set forth by the Council or that no conflict has been found with the rules. Consideration was given to the possibility that the use of the seal might be interpreted to have other significance. Further study of the question was authorized.

Medical Patents.—The Council's office as well as the other divisions of American Medical Association headquarters receives from time to time inquiries as to what the Association is doing concerning patents. The Council gave further consideration to the question in line with the Association's statement on medical ethics and with the report of the conference on medical patents of the Board of Trustees held March 16, 1939. No further report was authorized, but it was agreed that the Council should continue to give study to the question of medical patents.

Distribution of New and Nonofficial Remedies Copies to the American University of Beirut.—For many years the Council has supplied one class of each approved medical school paper bound copies of the current edition of New and Nonofficial Remedies. A petition was received from the University of Beirut, which is manned mainly by American teachers and by charter is a part of New York State University, to be included in this list. The Council was pleased to comply with the request and voted to send ninety copies of New and Nonofficial Remedies (one for each junior and one for each senior medical student) and provided for sending forty-five copies annually hereafter.

The National Institute of Health.—Dr. Veldee, chief of the division of biologic control of the institute, who was present as a guest, explained to the Council how the National Institute of Health operates in its duties of controlling the safety, purity and potency of preparations that are made from viruses, antitoxins, antiserums and analogous products. It was remarked that such information would be of interest to all physicians, especially an explanation of the meaning of the statement that a product has been "approved" by the National Institute of Health. Broadening the discussion to include other governmental activities related to pharmaceuticals and pharmaceutic preparations, the Council voted that committee draw up a report for publication concerning the exact significance of the Pharmacopeia, the National Formulary, the National Institute of Health, the Food and Drug Administration and other related organizations or publications and that appropriate statements be included in Council publications.

U. S. Department of Commerce: Technical Industrial Intelligence Committee.—Drs. Reed and Viehoever of the department gave an interesting discussion of their work in the investigation of scientific (medical, chemical and pharmaceutic) information obtained from enemy countries. Drs. Reed and Viehoever asked that the Council cooperate in evaluating the reports on medicinal preparations prepared as a result of investigations of the Technical Industrial Intelligence Division. The Council voted heartily to cooperate in this matter.

Therapeutic Research Committee.—The chairman of the Committee reported that almost twice as much had been distributed to investigators in 1946 as had been awarded in 1945. He felt that the reasons for the difference are, first, that most clinical investigators were thoroughly preoccupied during the war with war contracts and other things and could not do very much of the type of work that this committee assists in; second, that the Committee has adopted a rather more liberal policy effective this year, looking to somewhat more continuous and somewhat larger support for the worth while projects.

High Potency Vitamin D Preparations.—The Council has been continuously interested in the therapeutic use of vitamin D and especially in the possible danger from the use of massive dosage. It has published a report rejecting two preparations promoted for the massive use of vitamin D in arthritis. Attention was called to current practice of using vitamin D dosage of the order of 300,000 and 500,000 units in the treatment of psoriasis and to the rapidly growing practice of the use of massive vitamin D dosages in the prevention of rickets. As a result of the discussion the Council voted to authorize preparation of a report dealing with the misuse of vitamin D in large doses and the hazardous effect of such practice.

NEW AND NONOFFICIAL REMEDIES

The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies. A copy of the rules on which the Council bases its action will be sent on application.

Austin Smith, M.D., *Secretary.*

TABLETS BUFFERED PENICILLIN.—Tablets containing sodium or calcium penicillin and one or more buffering substances such as sodium citrate, aluminum dihydroxy amino acetate or aluminum hydroxide.

Actions and Uses.—Tablets buffered penicillin are intended for oral medication of the conditions for which penicillin has been found useful. Because of irregularities in absorption and because of destruction of much of the administered penicillin in the digestive tract, oral administration of penicillin should be preceded by administration of penicillin by the parenteral route. Tablets of penicillin should be used only after the infection is under control. Since gonorrhea responds rapidly to penicillin therapy, oral medication alone may be used in the absence of complications.

In order to achieve comparable blood concentrations of penicillin, from three to five times as much must be given orally as by the parenteral route. Gastric intolerance to the buffering agent may be encountered in some patients, necessitating abandonment of oral medication and a return to parenteral penicillin therapy.

Dosage.—Tablets buffered penicillin should be administered on a fasting stomach, not less than thirty minutes before or not less than one and one-half hours after eating.

Gonorrhea.—Combined Therapy: A single injection of 100,000 units followed not later than two or three hours by oral doses of 50,000 units each every two or three hours for six doses per day for one or two days.

Oral Therapy: Fifty thousand units every two or three hours for six doses per day for one or two days.

In complications such as arthritis, endocarditis and epididymitis, administer penicillin parenterally. Concurrent infections of gonorrhea and syphilis should always be considered. Treatment of gonorrhea under the foregoing dosage schedule may prevent the appearance of the chancre and thus mask the first evidence of syphilis. The masking of the chancre should not be construed as a beneficial effect. Blood serologic tests should be made once a month for a minimum of three months.

Pneumococcic, Streptococcic and Staphylococcic Infections.—A minimum of 20,000 to 40,000 units of penicillin parenterally every three hours. After the acute phase and when the temperature has been reduced, treatment may be continued with oral administration. Treat with a dosage of 40,000 to 50,000 units each two or three hours (day and night) for at least forty-eight hours after the temperature has returned to normal. If the condition is not controlled by oral penicillin, return to parenteral administration.

Prophylaxis.—Against secondary infections after tonsillectomy or tooth extraction in cases with a history of rheumatic fever or rheumatic heart disease, congenital heart disease and other conditions in which secondary infections may occur (infected teeth or tonsils), administer 100,000 to 200,000 units daily in divided doses from one day before to three or four days after surgery.

Precautions.—In meningitis, endocarditis and peritonitis, administer penicillin *only* parenterally. In acute infection with bacteremia or septicemia, parenteral administration of penicillin should be continued until the blood cultures become negative and the acute condition is controlled.

Abbott Laboratories, North Chicago, Ill.

Tablets Penicillin Calcium: 50,000 units with sodium citrate 0.5 Gm. as a buffer.

Bristol Laboratories, Inc., Syracuse, N. Y.

Tablets Penicillin Calcium: 50,000 units with calcium carbonate 0.5 Gm. as a buffer.

Schenley Laboratories, Inc., New York

Tablets Penicillin Calcium: 50,000 units with calcium carbonate 0.45 Gm. as a buffer.

E. R. Squibb & Sons, New York

Tablets Penicillin Calcium: 50,000 units with trisodium citrate 0.5 Gm. as a buffer.

PENICILLIN TROCHES.—Troches containing sodium or calcium penicillin.

Actions and Uses.—Penicillin Troches are designed to dissolve slowly in the mouth, releasing sufficient penicillin to maintain an antibacterial concentration of penicillin in the saliva. This medication has been found effective in controlling acute Vincent's infection of the mouth and pharynx. Chronic infections require additional manipulative therapy. Systemic infections should be treated by parenteral or oral administration of penicillin.

Dosage.—Allow one troche to dissolve in mouth two or three times daily.

Abbott Laboratories, North Chicago, Ill.

Troches Penicillin Calcium: 1,000 units.

Schenley Laboratories, Inc., New York

Troches Penicillin Calcium: 1,000 units.

E. R. Squibb & Sons, New York

Chewing Troches Penicillin Calcium: 20,000 units.

The Upjohn Company, Kalamazoo, Mich.

Troches Penicillin Calcium: 500 units.

DEATHS FOLLOWING THE USE OF "ANALBIS" SUPPOSITORIES

Recently the press and the radio have called attention to several deaths apparently due to Analbis Suppositories.

On Oct. 14, 1943 a new drug application was permitted to become effective for a suppository containing 135 mg. of the bismuth salt of diallylacetic acid dispersed in a cocoa butter base which was placed in commercial distribution by the Specific Pharmaceuticals, Inc., of New York City under the name Analbis Suppositories. Directions for use in children and adults were specific, and it was believed that the substance could be used under the conditions proposed and as directed. The preparation was recommended for pharyngitis, acute tonsillitis and gingivostomatitis. The successful use of bismuth preparations in the treatment of infections of the pharynx and adjacent structures had been reported by Lewis and by Silcox and Monteiro,[1] but injections were inconvenient and oral preparations of bismuth were either ineffective or produced undesirable gastrointestinal reactions. Rectal administration was shown to be effective and to have few undesirable effects.[2] None of the reports contained any indication that this preparation might produce untoward effects even when administered in animals or in human beings in amounts several times the recommended dose.

Deaths have been reported from several centers, including Texas, Norwalk, Conn., and New York City. At least 10 infants are reported to have died. Investigations by the Food and Drug Administration have revealed that none of the deaths can be attributed to bismuth poisoning, and it cannot be alleged at this time with certainty that the suppositories were responsible. However, in most instances investigated it was learned that from three to six times as many suppositories were used as were recommended by the manufacturer as the maximum dose. Diallylacetic acid may have been the cause of the deaths. At least the deaths are apparently due to an acute hepatitis and not to bismuth.

Whether the physician prescribed this overdosage or whether the parents of the patient undertook to exceed the physician's recommendation is not clear. Nevertheless, this tragedy again emphasizes the necessity for vigilance by physicians to prescribe properly, to be familiar with the properties and dosage of the drugs he uses, and to be cautious in prescribing new remedies about which only comparatively meager information is available.

Analbis Suppositories were voluntarily withdrawn from the market by the manufacturer after notification by the Food and Drug Administration of the deaths allegedly due to this preparation. The manufacturer submitted telegrams and letters to those who received shipments of the compound. Now the Food and Drug Administration with the cooperation of state and local authorities is attempting to secure the remaining suppositories. Physicians and pharmacists can cooperate by returning any unused suppositories to the manufacturer and warning patients for whom they have prescribed this medication to destroy or return the drug.

HUMAN TOXOPLASMOSIS

Toxoplasma has been known as a spontaneous infective agent for about ten years. In 1937 Wolf and Cowen[1] reported the presence of the infection in an infant born in New York who died at 4 weeks of age. Postmortem revealed widely disseminated inflammatory lesions of the brain and spinal cord. These were granulomas, areas of infiltration and necrosis, chiefly in the ventricular walls, and corresponding focal meningeal inflammation. Similar lesions were present in the retina and choroid of both eyes. An organism approximately 1.5 by 3 microns in size, usually ovoid and having a polar chromatin mass, was present in the lesions. The evidence indicated that the infection was congenital, probably a latent infection in the mother, which passed to the fetus by way of the placenta. The authors proposed that the disease be called granulomatous encephalomyelitis due to the organism Encephalitozoon hominis. Similar cases had been reported by Janku from Czechoslovakia, who observed inflammatory and degenerative changes in the eyes of a hydrocephalic infant and a parasite in the lesions, and by Torres of Rio de Janeiro, who reported a necropsy on a full term child that died at the age of 2 days; an intracellular

protozoon parasite was found in the central nervous system. Richter in 1936 had reported a similar case. Wolf, Cowen and Paige[2] reported next the disease in a white male infant delivered at full term by cesarean section who became ill at 3 days of age and died at the age of 31 days. Necropsy revealed a widespread encephalomyelitis with multiple focal areas of inflammation and necrosis and disseminated miliary granulomas. The right eye contained a localized zone of chorioretinitis. A protozoon parasite was present in the leptomeningeal and parenchymal exudate in the granulomas and in the lesions of the choroid and retina. The clinical and pathologic observations in this case were similar to those in the first 4 cases described in the literature. The authors concluded that this group formed a distinct disease entity, which affects young infants, produces manifestations of generalized involvement of the nervous system and terminates fatally after an acute or subacute course. The spinal fluid shows xanthochromia, high protein content and pleocytosis. Miliary granulomas are a characteristic feature of the process in the nervous system. A protozoon parasite is present in all the lesions. The results of transmission of the infection to animals from the case reported here indicate that the causative protozoon is a Toxoplasma. The designation Toxoplasma hominis is suggested for the micro-organism and toxoplasmic encephalomyelitis for the disease.

Pinkerton and Weinman[3] described the first authentic occurrence of toxoplasmosis in an adult. Pinkerton and Henderson[4] reported 2 fatalities from an acute, febrile, exanthematic disease in adults in St. Louis. Intracellular Toxoplasma organisms were found in the tissues in both these cases in such numbers as to leave no doubt concerning their etiologic significance. The clinical picture of the disease had almost nothing in common with that of the previously reported instances in infants. The disease entity closely simulates Rocky Mountain spotted fever and endemic typhus and has many features in common with certain of the recently described atypical pneumonias. Pathologically also the picture differs widely from that of the infantile type, the predominant feature being a peculiar type of interstitial pneumonitis. Meningoencephalitis, though present, is not conspicuous. The pathologic features common to the infantile and the adult type are focal brain lesions, myocarditis and the presence of Toxoplasma in the lesions. The disease was transmitted readily to guinea pigs by inoculation of blood taken from one of the patients during life and to mice by the intracranial inoculation of necropsy material from the same patient. Circumstantial evidence suggested that the disease may be transmitted by ticks. Sabin[5] reported in 1941 clinically atypical encephalitis occurring in boys 6 and 8 years of age during October 1939 and found definite evidence of the etiologic relationship of the protozoon parasite Toxoplasma in one and suggestive evidence in the other. One died thirty days after onset and the other recovered completely on the tenth day. Intracerebral and intra-abdominal inoculation of fresh brain suspension produced toxoplasmic infection in 5 of 8 mice which came from a stock that was proved to be free of spontaneous infection.

Sabin and his co-workers[6] developed a method of demonstrating neutralizing antibodies against Toxoplasma in the serum. Sabin demonstrated such antibodies not only in the serum of patients with toxoplasmosis but in that of their mothers and sometimes in that of other members of the family as well. Wolf, Cowen and Paige[7] inoculated into rabbits and mice infected material from the brain and spinal cord of an infant suffering from granulomatous encephalomyelitis and produced an experimental disease which was readily transmissible in series. A parasite identical with that in the lesions of the patients was found in the lesions of the experimental animals. The morphology of this micro-organism, the course of the disease, the lesions produced in the mammals inoculated with it and the results of cross immunity experiments establish its identity as a Toxoplasma. Zuelzer[8] reported 3 instances of infantile toxoplasmosis. Two of the patients represent the first instance of toxoplasmosis occurring in identical twins. The demonstration of the disease in twins and the presence of neutralizing antibodies in the maternal serum and the chronic character of most of the lesions observed in the twin who died of the disease at the age of 1 month constitute evidence for the occurrence of antepartum infections with Toxoplasma.

Callahan and his associates[9] report a study of a case of infantile toxoplasmic encephalomyelitis. They reviewed 10,000 necropsies recorded in the Department of Pathology, Washington University School of Medicine, and were able to find 5 cases of Toxoplasma infections which had not been previously recognized as such. These cases were listed under such diagnoses as chronic meningitis, syphilitic meningitis and encephalomalacia with calcification. Micro-organisms morphologically similar to Toxoplasma have been demonstrated in tissue sections in characteristic lesions in the central nervous system. The authors have collected and reviewed all the previously reported cases of toxoplasmosis. With regard to the incidence of the toxoplasmic infection, the authors feel that the studies of Sabin and Callahan suggest that this type of infection is more widespread than is generally realized. The serums of 59 of the 151 persons studied by Sabin had neutralizing substances for Toxoplasma, and positive reactors were found in a number of groups studied. In the group of infants and children tested, the incidence of neutralizing antibodies was found to be high only when certain clinical signs were present. With 1 exception, the infants who exhibited either chorioretinitis in the macular region or cerebral calcification or both in association with other signs and symptoms possessed neutralizing antibodies in their serum. The serums of 8 of the 10 mothers of these infants tested also revealed neutralizing antibodies. The pathologic changes within the gray matter of the cerebral cortex vary from small foci of cellular infiltration to large zones of necrosis with extensive destruction of brain substance. One of the consistent observations in the infantile type of toxoplasmosis is the presence of large foci of calcification within the zones of necrosis. Periventricular infiltration with lymphocytes and plasma cells with ulceration of the ependymal lining is frequently observed in infantile toxoplasmosis. This readily accounts for the internal hydrocephalus observed in infants with this disease. In contrast to the widespread destruction of the brain and spinal cord observed in infantile toxoplasmosis, the disease in adults and older children produces pathologic changes which are more manifest in other viscera with minimal lesions in the central nervous system. Eighty per cent of infants with toxoplasmic infection have internal hydrocephalus which is present at birth or appears shortly after. Frequent chorioretinal atrophy is present.

So far a specific therapeutic agent has not been found for toxoplasmic infection, although the administration of sulfapyridine may give beneficial results.

PHYSICAL EXAMINATIONS OF SELECTIVE SERVICE REGISTRANTS IN THE FINAL MONTHS OF THE WAR

The last years of the war were characterized chiefly by a growing need for men under 26 years of age to serve in the armed forces and an increasing scarcity of available manpower in this age group.[1] Hence it became necessary to restrict deferments in essential occupations, including agriculture, to reexamine many registrants who had formerly been rejected and to accept for military service some men who were unable to meet the physical requirements for general military service. As a result the rejection rates were higher during the final months of the war than during a period when the average age of examined men was less than 26 years.

During January 1944 through August 1945 the armed forces physically examined or reexamined some 5,767,000 registrants, of whom 2,536,800, or 44 per cent, were rejected for general military service. In addition, an estimated 1 to 2 per cent were rejected by local boards because of manifestly disqualifying defects.

Eighty-four per cent of the registrants physically examined during the last calendar year of hostilities were examined for the first time. These were chiefly men who registered with Selective Service at age 18 and men 19 to 25 years of age who had never been physically examined because they held deferments in essential occupations. A little less than 40 per cent (37.6) of this group were rejected on preliminary or preinduction examination.

The leading causes for all rejections during 1944—including local board rejections—were, in order of relative importance, mental disease, accounting for 26.8 per cent of all rejections; failure to meet the minimum intelligence standards, 12.8 per cent; musculoskeletal defects, 8.8 per cent; cardiovascular defects, 8.0 per cent; hernia, 4.9 per cent; ears, 4.4 per cent; neurologic disorders, 4.1 per cent; eye defects, 4.0 per cent; tuberculosis, 3.4 per cent, and mental deficiency, 2.6 per cent. These ten defects combined accounted for 80 per cent of all rejections during the year.

Tuberculosis, cardiovascular defects and musculoskeletal defects were of greater relative importance as causes for rejection among older men than among those under 26, who were more apt to be rejected because of mental and personality disorders.

Mental disease was the largest single cause for rejection in all the occupations except the two groups of laborers (farm and other). In these two groups mental deficiency and failure to meet the minimum intelligence standards caused the highest percentage of the rejections. Negroes are, of course, particularly concentrated in these groups.

Craftsmen and the professional and semiprofessional groups had a larger percentage of rejections for musculoskeletal and foot defects than did any other major occupations. Students had the highest percentage of rejections for cardiovascular defects; that for hernia was highest among service workers other than domestic and protective (barbers, beauticians, hospital attendants and others). The highest percentage of eye defects noted as cause for rejection was among students; tuberculosis and neurologic disorders each accounted for relatively more rejections of emergency workers and the unemployed than of any other group. Of the gainfully employed registrants, however, the highest percentage of tuberculosis rejections was among domestic and protective service workers.

These figures emphasize again the importance of the standards by which men are accepted or rejected in evaluating the general physical condition of any age group.

Current Comment

THE TAFT-SMITH-BALL-DONNELL BILL

Elsewhere in this issue appears a digest by the Bureau of Legal Medicine and Legislation of the Taft-Smith-Ball-Donnell national health bill. Physicians who read this carefully will realize that the principles set forth in this measure more nearly approximate the principles of the ten point national health program of the American Medical Association than any of the other health measures thus far proposed. It provides for a national health agency under medical direction; it provides for assembling health activities of the federal government in a single agency; it recognizes the principle of local responsibility and local control; scientifically it requires surveys to determine need before allocation of funds and does its utmost to avoid pauperization. Unusual is the inclusion of a special appropriation for prevention and control of cancer through the United States Public Health Service. The bill will be subject to hearings by the appropriate committees of the Senate and House of Representatives before final action is taken. Obviously complete approval will await the amended final text that usually evolves from the hearings.

STREPTOMYCIN FOR URINARY TRACT INFECTIONS

The results of a clinical study of streptomycin therapy of gonococcic urethritis, nonspecific urethritis, epididymitis and prostatitis have been reported by Pulaski.[1] The patients were resistant to treatment with the sulfonamides and penicillin. Symptoms of gonorrhea disappeared rapidly in 5 out of 9 patients following therapy with streptomycin without evident extension of infection to the prostate. In 2 or 3 patients whose prostates were enlarged the combination of prostatic massage and streptomycin eliminated the organisms. Treatment of 1 patient with prostatitis and 1 with urethritis and epididymitis failed. The usual amount of streptomycin administered was 0.5 Gm. dissolved in 5 cc. of isotonic solution of sodium chloride given intramuscularly every three hours for six days. Two patients with nongonococcic urethritis and 4 patients with nongonococcic urethritis and prostatitis were studied. The uncomplicated conditions responded readily to streptomycin and the patients have not shown signs of infection since. Four patients in whose infections prostatitis was a notable feature failed to be cured by streptomycin. Four paraplegic patients with indwelling catheters and epididymitis due to various organisms were also treated with streptomycin. In their infections streptomycin also failed, indicating, as with the prostatitis, that the drug did not find its way into the epididymis in sufficient concentrations to be effective. One patient with bilateral pelvic inflammatory disease was improved clinically but not cured by a ten day course of parenteral streptomycin therapy. These results suggest the need for further investigation of the use of streptomycin in the treatment of genitourinary infections.

REVISION AND EXPANSION OF THE BIOLOGICS REGULATIONS

The first Biologics Law was enacted July 1, 1902. When the 78th Congress consolidated and revised the laws relating to the Public Health Service, the Biologics Law was included. This law now appears in part F of the Public Health Service Act of July 1, 1944. These changes have necessitated a revision of the Regulations which are required to be prepared for governing the manufacture and sale of biologic products and to insure the continued safety, purity and potency of the preparations. The Regulations were published in the *Federal Register* on Jan. 21, 1947 and became effective thirty days later. As is indicated in these regulations, the scope of the Biologics Law is broadened somewhat so that diagnostic biologic products, if administered or applied to a person or prepared from or with the aid of a biologic product, may now be distributed in interstate commerce only if prepared by a licensed laboratory. Included in these categories are blood grouping serums, Rh typing serums and allergenic diagnostics, in addition to a number of less widely distributed preparations. Information as to the status of any of these products or the requirements applicable to them may be obtained from the Biologics Control Laboratory, National Institute of Health, Bethesda 14, Md.

RESIDENCIES IN VETERANS' HOSPITALS

The forty-third Annual Congress on Medical Education and Licensure featured a round table symposium on the cooperative enterprise of the Veterans Administration and the medical schools in providing a high quality of medical care to veterans as well as residency training for physicians. Participating in the informal discussion were representatives of the Veterans Administration and the deans of schools in which the program has been developed furthest. This discussion, abstracted elsewhere in this issue, contains much useful information for those engaged in the project, especially medical schools just commencing the program. In the symposium answers were provided for such important questions as the authority to appoint or dismiss staff members and residents, the manner in which supplies and equipment may be secured with dispatch, research in veterans' hospitals, suggested internships, difficulties of geography and mechanisms for "trouble shooting." The whole program, the participants agreed, has vastly improved the medical care of veterans and must be made to work. Dr. Paul Magnuson, representing the Veterans Administration, stated that "the work being done by these medical schools under the direction of the deans' committees has been the greatest accomplishment to date in the relationships between government and private medicine."

Dr. Herman G. Weiskotten, Syracuse, N. Y., Presiding

RESIDENCY PROGRAMS IN VETERANS' HOSPITALS

A ROUND TABLE DISCUSSION

Participants in Discussion

Moderator:

- Loren R. Chandler, M.D., San Francisco, Dean, Stanford University School of Medicine.

Discussers:

- E. H. Cushing, M.D., Washington, D. C., Chief of Educational Division, Veterans Administration.
- Harold S. Diehl, M.D., Minneapolis, Dean, University of Minnesota Medical School.
- Tinsley R. Harrison, M.D., Dallas, Texas, Professor of Internal Medicine, Southwestern Medical College.
- Paul B. Magnuson, M.D., Washington, D. C., Acting Assistant Medical Director for Research and Education, Veterans Administration.
- J. Roscoe Miller, M.D., Chicago, Dean, Northwestern University Medical School.
- Burrell O. Raulston, M.D., Los Angeles, Dean, University of Southern California School of Medicine.

Abstract of Discussion

Dr. Chandler: *Dr. Weiskotten and Members of the Congress:* This panel will discuss the resident training program in Veterans Administration hospitals. (Dr. Chandler then introduced the discussers.)

I think it is fair to state that every one in the medical profession, particularly those in medical schools, not only is interested in the present veterans' medical care program but is anxious to see it work. This program involves very intimate cooperation between the Veterans Administration, medical school faculties and hospital residents. This collaborative enterprise is now about a year old, so that it is appropriate to discuss at this time some of the problems faced by the faculties, deans' committees and the Veterans Administration. By way of introduction to the discussion, Dr. Magnuson will summarize progress to date.

Dr. Magnuson: Undoubtedly most of you are familiar with the principles on which this program was started. It was established because we had to have good doctors and have them fast. We had millions of men returning from the services in addition to a considerable patient load from the previous war. Our hospitals were pretty well filled when men began to return from this war. There were three problems: first, the medical care of the veteran; second, the provision of training for physicians whose training was curtailed by the war; third, supplying of useful work and an income for young returning medical officers. It was impossible to secure competent full time men for the job. Furthermore, we felt we could get a better quality of men on a part time basis, so we appealed to the medical schools. There was not one single negative answer in reply to our request for cooperation. Within five months from the initiation of this training program there were fifty-seven medical schools collaborating with the veterans' hospitals. There are now some 1,400 to 1,500 residents in veterans' hospitals which are staffed by more than 1,500 part time men of instructor to professorial rank from the fifty-seven approved medical schools. The work being done by these medical schools under the direction of the deans' committees has been the greatest accomplishment to date in the relationships between government and medicine. So far the program has been free from political interference. When a Senator or Congressman or an influential citizen telephones, wanting one of his friends appointed to a hospital position, we simply say "Senator, we don't select the hospital staff. Physicians are recommended by the deans' committees to the manager of the hospital. They are appointed on that recommendation." In this way the hospitals are staffed for the most part by the medical schools, with only a skeleton staff of Veterans Administration men. The program is working unbelievably well despite the short time since it was started.

Dr. Chandler: Dr. Miller, Northwestern was perhaps the first school in the project. How is it working?

Dr. Miller: We were the first group organized. We have been operating a little over a year now. We also are unique in that I think we have the largest hospital—Hines, with 3,500 beds. Northwestern and the University of Illinois are cooperating in the venture. We have divided the Hines services among the faculty of the two universities. At the present time we have about 144 residents in training. Our great difficulty is that of geography. The hospital is located some miles from the center of the city. It takes thirty to forty-five minutes of driving through traffic to get there, and a good deal longer on the common carriers. As a result, the hospital offers little to us as far as teaching or research is concerned, but we have been able, because of our large voluntary and partly paid faculty, to cover the services quite adequately.

Dr. Magnuson: Dr. Chandler, I should like to emphasize that General Bradley and General Hawley promised, when I went to Washington, to build the new veterans' hospitals as close to medical schools as possible. I specified that, if possible, they should be sufficiently close so that they could be connected with the university hospital and medical school by tunnels. Dr. Miller is entirely correct about the distance between Hines and the two medical schools constituting a tremendous handicap. Fortunately, we now have the ground to build across the street from Passavant Hospital at Northwestern University and across the street from the University of Illinois hospital on the West side. These constructions have been approved and funds appropriated.

Dr. Diehl: At Minnesota our situation is a little different from that in Chicago. We were the second institution to organize a program in the veterans' hospital, commencing about two weeks after the program at Hines. We were fortunate in the location of the hospital. In Minneapolis the veterans' hospital, an 800 bed institution, is located about 7 miles from the medical school. It is readily accessible by a very easy drive of fifteen to twenty minutes, even though it is not just across the street. We started to select the staff a little over a year ago. Of the old medical staff of the hospital five have been retained. One of these is serving in an administrative capacity, two have been appointed as residents and two are serving as members of the professional staff. The latter two are professionally competent men who have since been appointed to the university faculty. The rest of the staff is completely new. At present the hospital staff consists of twenty-one consultants, seventeen of whom receive compensation from the Veterans Administration. Ordinarily these consultants make one visit a week. Some go to the veterans' hospital only on call. Consultants are compensated at the rate of $50 for a half day at the hospital in almost all instances. In addition, there are thirty-seven attending physicians on the staff. These men are also certified by the boards. They spend a half day on each visit to the hospital. The majority of them make daily visits, although some make three visits a week, depending on what we think is best for the service. We have attempted to keep the appointment of full time men of the medical school faculty at the veterans' hospital to a minimum. There are now 107 residents on the staff. Eighty-four of those are on service in veterans' hospitals and the remainder are on services in affiliated hospitals. I think it is interesting to note what this program is doing to improve and extend medical service to veterans, which is the primary object of this whole program. A comparison of certain statistics for 1945 and 1946 in this hospital reveals that in 1945, when this hospital was operated by the old Veterans Administration staff, there were 4,750 admissions. In 1946, when it was operated under the new staff, even though part of the year was devoted to building the staff, there were 6,506 admissions, an increase of 1,756 patients. The bed capacity was unchanged. Thus, under the new program over 1,700 patients were given hospital care who, under the tempo of the old system, could not have been given assistance. This is an increase of 37 per cent. In spite of this increased admission rate the mortality rate has decreased 29 per cent. Those figures seem to be indicative of what this type of program can do to improve the medical care of veterans.

DR. MAGNUSON: Admission figures may be misleading. In many of our old Veterans Administration hospitals they ran what was called an admission ward, which was filled almost daily with people who might stay only two or three days. Furthermore, in some of our deans' committee operated hospitals the admissions have decreased because at least 50 per cent of the people who apply for admission are not admitted because they do not need hospitalization. In the old days they used to take everybody who applied.

DR. HARRISON: Our experience in Dallas is similar to the experiences cited. There is the difference that we have been concerned with two hospitals, one 10 miles south of us and one 30 miles to the north. In the last year we have developed services in both of those places. The geographic problem has been difficult but not insuperable. I think that every one finds that the care of veterans is improving wherever there are deans' committees' hospitals. Most of us feel that medical school training in the country, in general, is definitely superior to hospital training. Only a fraction of our graduates have been able to secure appointments in first rate hospitals. One of the tremendous advances resulting from these veterans' hospital programs is to strengthen that part of medical education which has been weakest, the Achilles heel of medical education. The kind of care the veterans will receive depends on the caliber of the staff. Building a good staff takes time. If we maintain high standards for residents, it takes longer to develop a residency program. If we maintain high standards for full time employees who are not appointed by the medical school but about whom we can make recommendations, it takes longer. But, as time goes on, it is becoming increasingly possible to recommend for full time positions a small skeleton staff of men who are of superior caliber. All of us who have been concerned with this in Dallas are extremely enthusiastic about this trend.

DR. MAGNUSON: Yes, every time I send a good man down from the central office to help a dean he steals the man, makes him chief of a service and puts him on the faculty.

DR. RAULSTON: In Los Angeles we started this program at the Sautelle and the Wadsworth Memorial hospitals on July 1, 1946. We have obtained the type of attending man we desired: men certified by a board, who were veterans and had appointments on the teaching faculties of one of the two medical schools. Ours is a joint project of the College of Medical Evangelists and the University of Southern California, operating with reasonably good feeling. Not only have we been able to obtain an adequate number of properly qualified attending physicians, but in some departments the demand for appointments is sometimes so great as to become embarrassing. Our hospital is located in a suburb of Los Angeles, and geography is not a serious problem. We have had excellent cooperation nearly always from the local veterans administration and certainly all the time from headquarters in Washington. We have been overwhelmed with applications for residencies, as is generally the case. We have about eighty residents in this hospital, with a potential capacity of about 2,000 beds and a present census of about 1,400 patients. Our first consideration is the care of the patients. Evidence of their satisfaction comes from innumerable letters, verbal statements and the great reduction in complaints from patients. The teaching program for the residents has been surprisingly good.

DR. CHANDLER: There is no question about support of the deans' committees at the Washington level. But there is considerable question regarding the full support of the program from the Bradley-Hawley-Magnuson level all the way down to the local managers. I should like to put this question: What should be the fundamental basis for cooperation between the Veterans Administration and the medical schools in order to operate this program successfully with university standards, Dr. Cushing?

DR. CUSHING: The central office turns over the teaching program entirely to the deans in the medical schools. We don't want to try to tell any one out in the field how to practice or teach medicine. We know that the deans are expert in teaching and practicing medicine throughout the country. We ask them to do likewise in the veterans' hospitals.

DR. DIEHL: I should like to comment on the question you put, Dr. Chandler. This project has been a unique and remarkable experience. We embarked on this extensive program a year ago with no formal agreement, blueprint or chart of procedure. Dr. Magnuson simply came to us and said "We want you to take over and run this hospital as you would a university hospital." Some deans have asked me "What sort of a contract do you have with the Veterans Administration?" We haven't any. The arrangement is entirely a matter of mutual confidence and common interest. There are advantages to the medical school in such a plan. We have no obligation to continue this program other than a moral one, which is all the Veterans Administration asks. They know we will continue with the project as long as high quality is maintained. We could not have asked for better support than we have had.

DR. MILLER: That is essentially our experience; we have had no trouble even at the local level. The educational policy of the hospital and the professional care of the patient are entirely in our hands. We have been fortunate in having managers sympathetic with the program and anxious to help, who have in no way hampered our program. Such difficulties as we have encountered have not been at the local or the Washington levels but in the intermediate echelons, although this has not been serious enough to constitute a great handicap.

DR. MAGNUSON: We must all realize what a tremendous expansion has occurred since July 1945 in the Veterans Administration, which is now taking care of a hundred thousand patients. Under these conditions it is absolutely impossible to secure a completely new staff immediately. We had a lot of men in the Veterans Administration who were trained over twenty years to say "No, it can't be done," instead of "Yes, we will do it." They must be reeducated or replaced. Our hospitals vary greatly, depending on the caliber of the personnel in the supply department and in administrative and professional posts. Some of these fellows cannot throw away the book and get things done as ordered by General Bradley, who insists that anything that is for the good of the patient can be justified. Despite everything, some of these old Veterans Adminstration men will still say "Well, that wasn't the way it has been done for the last twenty years. We have to get everybody's approval from here up to Washington and back again." The appropriate orders have all been issued, but to try to get the idea through some of the thick skulls is a very difficult job. You will have to hammer from your end and I promise you we will hammer from ours; eventually we shall meet: the fellow in the middle is going to have a hell of a time.

Dr. Diehl: Whenever we have encountered difficulties we have done as Dr. Magnuson urges: "*Don't write me a letter, telephone!*" This formula has ironed out problems as rapidly as anybody could possibly hope.

Dr. Chandler: The answer seems obvious: If all is not well, telephone Dr. Magnuson.

Dr. Cushing: We are often asked what fields of medicine are represented by our residencies. We don't have any service connected obstetrics or pediatrics at the present time. This includes pediatric orthopedics and gynecology except for occasional cases.

Dr. Chandler: This touches on an important matter of policy: should the residency training programs in a given veterans' hospital be confined to those fields in which the training can be done entirely at that hospital?

Dr. Raulston: We have two veterans' hospitals in Los Angeles. Apparently it is the policy of the Veterans Administration to develop certain residency services in one hospital more than in the other, so that the two may be supplementary We propose to rotate our residents from one of those hospitals to the other in order to improve the educational program. We find it exceedingly difficult to add affiliated services in other hospitals, because Los Angeles has very few teaching facilities in its private hospitals.

Dr. Diehl: We believe that there should be a free exchange and rotation of residents between the veterans' hospitals and our other teaching hospitals. In fact, our deans' committee would like to make some assignments to other hospitals for all residents in the veterans' hospital. Our orthopedic residents now go elsewhere for their experience with children and corrective orthopedics. Some of them will go to general hospitals for the traumatic type of surgery. Some of our residents at the veterans' hospital spend time at the University Hospital, at Minneapolis General Hospital and some at private hospitals where good surgical training is offered. In internal medicine there is a rotation program in which most if not all of the residents at the veterans' hospital have some work at the Minneapolis General Hospital.

Dr. Miller: The problem of affiliated services is much more difficult in Chicago for geographic reasons. Practically every service we offer is complete in the veterans' hospital except for the basic medical sciences and children's orthopedics.

Dr. Cushing: We have a rule that 50 per cent of the resident's time can be in outside hospitals. We prefer to have the men get their start in the Veterans Administration hospitals and obtain their outside training later. Many people have been asking about the duration of the appointment of the resident. It isn't necessarily a flat three year term. The deans' committees determine this. The committee periodically reviews the work of the residents; if they are good they can continue; if they are unsatisfactory they can be dismissed at any time.

Dr. Chandler: Who has the authority to make such decisions?

Dr. Cushing: The central office or the Veterans Administration has nothing to do with it. The deans' committee is the group that is responsible for the training of the residents and they are the men that select the residents and decide when they should leave the service either because of unsatisfactory work or because they have completed their course of training.

Dr. Harrison: Regarding affiliated hospitals, much depends on the field of medicine involved. In some fields, such as psychiatry or orthopedics, it may be necessary to work at affiliated hospitals for a relatively long time. In other areas, such as general surgery and internal medicine, there is ample clinical material at the Veterans Administration hospitals to train the men. Regarding the work of the resident at the medical school, there should be a great deal of flexibility. For the rare few, research is better than a formal course. Other residents might better be assigned to some preclinical department.

Dr. Magnuson: Laying out a formal course for men who are supposed to be educated and want to become specialists is perfectly asinine.

Dr. Chandler: I want to be sure that we are clear on the question of duration of appointment of residents. Some of these appointees seem to think they have a bona fide guaranty of three years' residency training, win, lose or draw.

Dr. Magnuson: You can terminate anybody's appointment in the Veterans Administration any time he doesn't do his job or isn't of service, and that goes for everybody. The residents can have their service discontinued at any time, even though the man may have started on a two year or three year program which was planned for him at the outset. Since the law definitely limits the training outside a veterans' hospital to 50 per cent of the time, it is a good deal better to assign men on a two year training program, for example, to do the first year of work in the veterans' hospital. To comment further on the problem of affiliated hospitals: Most residents can be trained within the Veterans Administration hospitals without going back and forth between those hospitals, the medical schools and other hospitals. It is well to keep him on service and give him his training within the veterans' hospital as far as possible.

Dr. Cushing: I wish to remind you that appointments to the attending staff, by law, are for one year, from the first of July to the last of the following June. However, the year's service can be arranged for the attending and consultant staff as the deans' committees desire. A man may be an attending physician every day for three months and then be off for three months, say. Or there may be an alternate day system. In any case, the termination of the appointment officially is on the thirtieth of June. Reappointments should be recommended by the deans well before that date each year.

Dr. Chandler: Nearly everybody connected with the Veterans Administration hospital training program has asked about provisions for research by residents and staff. What is being done?

Dr. Magnuson: We have the authority to provide funds directly from the central office to establish research laboratories in our hospitals, although the hospital concerned has to find the space in the first place, which is arranged locally. We have no money for new building construction for research. New construction is not acutely necessary because usually the hospital can find the required space. When that is found and the deans' committee plans a research laboratory with its equipment, specifying what is required and its cost, the expenditure can be authorized, so that the hospital can buy what is required. As regards additional research personnel, one or two technicians will suffice in most instances. The research problems that are contemplated should be described to us. When approved, they can be included in the hospital budget and be continued from year to year as seems justifiable. All new research problems must be referred to the Department of Research and Education to avoid our wasting funds on mental abortions labeled as research ideas. We cannot let anybody do whatever "research" strikes his fancy any more than you deans can in your medical schools. Each project must be approved and assigned necessary funds from the central office. Continuing financial support will be appropriated through the hospital management on its research fund from year to year. We expect to establish and support research laboratories in every veterans hospital associated with a medical school, under the provisions of the general budget.

Dr. Chandler: How many veterans' hospitals are already engaged in research, or how many requests for approval of research projects are under consideration?

Dr. Miller: We have already found space at Hines for a rather adequate laboratory for research in clinical neurology, and considerable space has been earmarked for cancer research.

Dr. Diehl: As soon as our staff was organized and seemed to be meeting the clinical responsibilities, it desired to commence investigative work for the benefit of its patients and also of the residents. We were able to find some additional space in the building and by setting up quonset huts arranged for space locally. Then we planned the installation of the scientific equipment necessary for research laboratories in medicine, surgery, clinical physiology, bacteriology and other subjects and submitted the program to Washington. Subsequently our veterans' hospital received a special grant of funds to provide these research laboratories; they are now being equipped.

DR. CHANDLER: About how long did it take after your request before you got the required authorization?

DR. DIEHL: Well, we submitted the request and wondered why nothing happened, for a time. Apparently the papers got lost along the line somewhere. So I telephoned Dr. Magnuson. Within twenty-four hours a telegram came to the local branch office authorizing the necessary expenditures.

DR. HARRISON: Because research opportunities will be available at veterans' hospitals, staff appointments may well become the most desirable full time associate professorship, particularly in medicine and surgery, that this country can offer. The salary scale is excellent, and other advantages are real. Therefore the selection of the staff should not be rushed too rapidly just because there is a job to be done. Let us go slowly and attract into these full time positions the best available medical talent.

DR. RAULSTON: I should like to report that we have research programs going on in both of our hospitals; they are progressing very nicely.

DR. DIEHL: The staff physicians at our hospital have been amazed at the interesting clinical material they encounter, not only from the point of view of clinical medicine, but from that of teaching and research. They do not deal with the dull, uninteresting patient anticipated by many.

DR. CHANDLER: Should we add interns to the veterans' hospitals?

DR. CUSHING: The law limits us to residents at the present time, but a change in legislation is under consideration to allow internships in Veterans Administration hospitals.

DR. MILLER: There is no reason why we could not start internships at any time at Hines. Our residency organization is well adapted for an internship program.

DR. RAULSTON: At the outset of this program Dr. Magnuson said he wanted these hospitals to be like university teaching hospitals. I don't know of any such hospitals that do not have interns.

DR. CHANDLER: A teaching hospital has medical students in clerkships, interns, residents, full time and part time attending teachers, research men, clinicians and directors. May we anticipate that veterans' hospitals will eventually encompass these activities and become true university teaching and medical care hospitals?

DR. MAGNUSON: Remember that we are starting a new program. It must prove its worth to the people of this country. The public must learn that the men in veterans' hospitals are not employed as guinea pigs. We have started with an educational program for residents, who are all veterans, who have been medical officers. They are all licensed to practice medicine. The law plainly states that doctors who take care of veterans must be licensed to practice medicine. In many states, licensure requires an internship. Some states do not. Rather than urge men to go to such states and take examinations on graduation from medical school to comply with the law, should we not seek to change the law after convincing the public that the veterans benefit from educational programs? It is significant that the American Legion Rehabilitation Committee has asked when we plan to start internships. It recognizes that all good hospitals have interns. Internships are on the way, but first we must change the existing law. As regards medical students serving as clinical clerks, I know of no law against it.

DR. DIEHL: This question of interns is interesting. Recently the dean of the medical school at the University of Manitoba and I discussed our program. He stated that they have an arrangement with the veterans' hospital in Winnipeg which enables them to conduct not only graduate and intern training but also clinical clerkship teaching. He was sure the Veterans Administration in Canada would dislike changing this program. Veterans' hospitals can provide excellent internships. Of course, there are some limitations. A complete rotating internship would require affiliations with other hospitals. In any case the veterans and the public must be made to realize that an acceptable internship program improves the care of patients.

DR HARRISON: A hospital can attract better residents if there are interns. Residents are commonly recruited from the intern staff. Again, we shall obtain better interns if there are clinical clerks in the hospital. There is no question but that the caliber of men we attract to these residencies will be higher if we have interns and clinical clerks in the veterans' hospitals. Every day we encounter men who prefer residencies at civilian hospitals, despite a lower income, because there is teaching of interns and clinical clerks.

DR. CHANDLER: Apparently we may anticipate internships in due course of time, following on an amendment to the present law. What about medical libraries in the various hospitals?

DR. CUSHING: We are having considerable trouble with our medical libraries. I think the system is improving and we are gradually getting more books and journals into the hospitals. There is plenty of library money available. You need only write and request the books you want. There is money for binding and for duplicate copies of books. But you must order the books and journals from us.

DR. CHANDLER: What about supplies and equipment in veterans' hospitals, particularly in the laboratories? Are they adequate?

DR. HARRISON: That has been a difficulty because orders must go through a supply officer not directly concerned with medicine and surgery. A change is needed in this procedure.

DR. DIEHL: That has been our worst problem also. I judge that much depends on the local supply officers. Some really go out and get things. Others sit behind a desk and discover reasons for not getting things.

DR. CHANDLER: Speaking for Fort Miley in San Francisco, being jointly operated by the University of California and Stanford, this problem has been our big headache too.

DR. MAGNUSON: Supply and equipment have been the worst difficulty in the central office, and again I must remind you that it depends entirely on your local supply officer employing the existing machinery to get whatever you and the patient need at once. You should exert every pressure to get action. The deans' committees must demand what they need to treat patients. But be reasonable. Don't order fifty microscopes if twenty-five will do. As to drugs, laboratory equipment and the like, if the supply department does not have them, the supply officers have full authority to buy them on the open market. There is no reason for delay except inefficiency of a local supply officer. Everybody in the hospital is responsible to General Hawley. We are trying to convince these local administrators that their sole duty is to service the doctor so that he can serve the patient. As you know, the country is divided into thirteen districts, so that many problems should be handled locally. In the old days you had to telephone Washington to get permission to call in a consultant to take care of a patient who was acutely ill. A patient was most unfortunate if he became acutely ill on Friday afternoon after half-past 4, because he couldn't be taken care of until Monday at half-past 9.

DR. CHANDLER: We have been "on the air" for an hour and ten minutes. Perhaps we should sign off now, with this statement: the wisdom, integrity and sincerity of the efforts on behalf of this program at the Washington level warrant the whole-hearted support of all of us. This thing has got to work. Thank you.

NATIONAL CONFERENCE ON RURAL HEALTH

Second Annual Meeting, Palmer House, Chicago, Feb. 7 and 8, 1947

DR. F. S. CROCKETT, Lafayette, Ind., Presiding

(Concluded from page 785)

SATURDAY, FEBRUARY 8

Hospital Facilities and Health Centers for Rural Areas

MR. GRAHAM L. DAVIS, Director, Division of Hospitals, W. K. Kellogg Foundation, Battle Creek, Mich.; Member Advisory Board, Federal Hospital Council: This Michigan project in a way grew out of the activities of the W. K. Kellogg Foundation. Its large interest for the past seventeen years has been a seven county rural health project in southwestern Michigan. The foundation believes that its resources can be used to best advantage in applying knowledge rather than in research or relief activities. So we have tried to find out what the rural health and welfare problems are in those seven counties, and that activity has been expanded to all of the state of Michigan. We are inclined to believe, based on our experiences there, that the large weakness in rural hospital and health service is the absence of good diagnostic facilities and services. In other words, to treat a patient successfully you must find out what's the matter with him; and the modern doctor uses the x-rays and the laboratory to find out.

This Michigan hospital study was made by the Commission on Hospital Care as a pertinent study that other states might use in making similar studies and, as you know, now every state in the country is making a hospital study to comply with the requirements of Public Law 725, the Hospital Survey and Construction Act. The Michigan study has been published and widely distributed. The most interesting thing about the Michigan study was that the group of thirty-five persons the government selected to cooperate with the Commission on Hospital Care made a recommendation that the 292 general and allied special hospitals that we have in Michigan should be reduced in number to 110 located in seventy-one hospital areas.

The basic principle followed in defining these seventy-one hospital areas was that you shouldn't build a hospital where the need was for less than 50 beds. You cannot profitably use the services of a minimum of technical personnel needed when you have less than 50 beds averaging say 30 patients a day. A population of some 15,000 is necessary to support such a hospital. We also decided there should be hospital facilities within 30 miles of everybody in Michigan. When you get up here, you don't have 15,000 within a radius of 30 miles, so we had to compromise on a small unit; but the recommendation is that it must be supplied as a branch of the nearest large hospital.

The American College of Surgeons doesn't survey hospitals with less than 25 beds. It approves only 47 per cent of the hospitals with from 25 to 50 beds, but 93 per cent of hospitals with 100 or more beds.

The major weakness in rural medical service and hospital care is shown by the top half of Michigan. There are about half a million people there. North of that line there is only one radiologist, and there are no pathologists. The foundation located the first pathologist in the north peninsula at Marquette on the 1st of August. The major purpose of our program is to improve the quality of service in that area. There is one doctor 65 years old to take care of 10,000 people. At St. Ignace there is no hospital, there are 7 or 8 thousand people, one doctor over 80, and two osteopaths. Three of these hospital areas have no hospitals, and it seems that those three areas should come first. Rogers City, St. Ignace and L'Anse are the three. In fourteen other rural areas, ranging in population from 15 to 35 or 40 thousand, the hospital is an old house or similar structure. Under the act, preference must be given to rural areas. The 32 million dollars to be spent in the next five years in Michigan under this plan will take care of about one third of Michigan's needs for adequate hospital facilities. We need to spend about 90 million dollars to modernize and enlarge Michigan's total hospital facilities.

The major recommendation in this Michigan report is that the general hospital should be the focal point around which you develop the community health service, in addition to its traditional functions. In this integrated system we add 181 so-called public health and medical service centers. In most instances they need not have beds at all, and they would operate as branches of the general hospital. These units would have the office of the public health nurse in the community, two or three doctors in this town of a thousand people, a certain amount of diagnostic facilities, the dentist's office might be there, and so on. In some of these more thinly settled areas it is 25 or 30 miles to the nearest hospital, and we anticipate that there should be beds for normal obstetrics and perhaps emergency cases and certain types of medical cases that the general practitioner in those communities could treat.

Report of Committee on Hospital Facilities and Health Centers

DR. ALLEN T. STEWART: The problem was divided by the committee under three general topics: 1. Is there a need for improved medical care in rural areas? 2. What is being done now toward improving that condition? 3. What further is there to do? First the committee debated the definition of the terms "community clinic," "public health center," "hospital" and "medical center." We recommend that the definition of these terms be clarified.

Dr. A. C. Bachmeyer, in discussing the first topic, said that, according to a 1940 census, from between 19 and 20 million people lived in the open country. In over 11,171 of these communities having less than 1,000 population there were only 151 hospitals, 85 per cent of which had less than 50 beds. In the open country outside of all villages there were only 90 hospitals in the United States. Over 50 per cent of these hospitals had less than a 50 bed capacity, and most were special type institutions.

Next was the question What is being done toward improving the condition? and Dr. A. B. Wilson of the Public Health Service was called on to explain the Hill-Burton bill, or Public Law 725. Dr. Wilson stated that before any funds are made available each state must evolve a long range plan based on its needs as ascertained by survey and have the plan approved by the Surgeon General. Mrs. Weagly informed the committee that Senator Taft had told her that under the terms of the bill such an approved community project would receive federal assistance to the amount of one third of the cost of construction and equipment, not including the cost of the site.

The third point concerns the establishment of interested farm groups. The committee believes that these needs can be handled in the execution of the following four point program: 1. Actual formation of individual state plans now being made, so that federal appropriations may be secured. 2. A campaign to educate the population in regard to the medical situation in rural areas. 3. Community action. 4. Cooperation among community groups with the state plan.

Under community action falls the establishment of facilities for providing medical care. Even though 20 million people live in small towns and villages, it need not be assumed that all of these small towns must have hospitals. The danger to avoid is building a hospital that cannot be adequately supported and which therefore cannot render a high quality of service. Before any rural community builds a hospital, a careful study should be made. Hospitals should be constructed only where the size of the population, the availability of technical personnel, transportation and topographic factors and methods of financing justify the establishment and indicate continuous successful operation of such facilities. In this manner the medical profession would be brought into outlying districts on a consultation basis, the practitioner would have access to hospital facilities and the medical profession would exercise control over the quality of medical care in that area. These three points just discussed depend for their success on the fourth, the cooperation among community groups with the state plan.

DISCUSSION

Dr. Carl F. Vohs, St. Louis: We shouldn't lose sight of the long range program of hospital construction. Some facilities for the care of the aged, from the standpoint of medical care and custodial care, must play an important role in the development of our facilities. From the standpoint of prepayment medical plans I think that the hospitals must create some facilities that are cheaper than the $10,000 program that is being planned.

Dr. Ernest E. Shaw, Indianola, Iowa: We need to know just why no hospital with less than 50 beds is important. I practice in a town of 5,000 and I have a collaborator who practices in one of 1,200 and he says I'm not a rural practitioner. I have seen a good many small hospitals which are very well run. I feel there is a place for a hospital of less than 50 beds. We have a group in the northern part of the state with a radiologist and a pathologist. Those men go out one day a week to five surrounding towns and spend a day. They also go out on emergency cases. Those hospitals of 20 beds are doing a bang-up job, that is, good pathology services; and it would be a shame to try to make a 50 bed hospital there. I believe in all those things being done, but 85 to 90 per cent of our patients can be taken care of any place where they have a bed. We get along very well. We can have good medical service at a cost much less than that required for these hospitals.

Dr. Roy Woolsey, Salt Lake City: Yesterday I advanced an idea that is coming from the industrial commission in Utah. Because of the location of mines away from Salt Lake City and Ogden, where the only large hospitals in the state are located, the practice has been for a long time in mining communities and in small farming communities of moving patients into the large hospitals. From that I develop the thought that in these 10 and 15 bed hospitals if there were patients who required specialists how much simpler and more convenient for the patient and the family to send the specialists to the small hospital. Let him go out and do the surgery and keep the people at home. I went 150 miles one afternoon and the next morning did some work in a very small hospital. The three doctors in this area cooperated. One gave the anesthetic, another assisted, and the other one looked after the general work in the community while the rest were tied up. We had three major pelvic operations during the morning. I came back that evening and the patient stayed at home. In fracture cases it is reasonably easy to have an orthopedist go out and have the work done in a small hospital. It's a thought that I think is worth considering.

Dr. Graham L. Davis, Michigan: I want to say that as a member of the Federal Hospital Council, which has had under consideration Public Law 725 and the discussion of the regulations under which that law must be administered, this issue of the minimum size of the hospital was carefully considered by the council at its meetings. The Federal Hospital Council includes those familiar with hospitals and those familiar with community needs and the proposal which had been made that no hospital be approved for a fund unless it had 50 beds was definitely not approved by the Federal Hospital Council; and the regulations which have been approved by the Surgeon General, by the Federal Security Administrator, and which will now be disseminated do not require that a hospital of less than 50 beds be not approved.

Committee on Methods of Bringing and Holding Physicians and Dentists in Rural Areas

Dr. H. B. Mulholland, Charlottesville, Va.: As a result of discussions yesterday and deliberations of the leaders of the panel last night we recommend: 1. The development of state and county health councils composed of representatives of the medical, dental, farm and other organizations concerned with the rural problem. We urge that these councils study the health needs and develop plans and programs for improvement of rural health in each particular area. 2. The development of adequate health facilities in rural areas where a competent survey has shown that these facilities are needed. We recognize that in order to attract and retain physicians and dentists certain fundamentals seem necessary: (*a*) provision of adequate medical facilities; (*b*) provision of a reasonable income for physicians and dentists in these areas; (*c*) stimulation of practice in groups; (*d*) a concomitant improvement of community educational and cultural facilities; (*e*) extension of good roads and the development of community understanding of its responsibilities with reference to all health matters. We also recognize that this whole problem is intimately tied in with the whole social and economic inadequacies in rural areas and the maintenance of a reasonable and stable income of rural people is the underlying factor in the achievement of these objectives. 3. The development through provision of funds in the various states of a program of medical and dental care, and this program should be best supplemented by a sound program of health education in the schools. 4. That the medical schools place more emphasis on the economic problems of medicine in the medical school curriculum. We suggest that medical students have practical experience in rural medicine in some point in their undergraduate courses. In our opinion a successful rural medical organization should include rotation of some interns through a coordinated hospital system including perhaps health centers.

DISCUSSION

J. S. Jones, Minnesota: I rise to amplify the first recommendation, that is, the meetings in the communities, in the counties or parishes, whatever they may be, of a joint group of the professional people involved and leaders of the rural organizations in order that this program may become effective. After we go from this conference we shall be in the same place we were when we arrived unless we do something. This should be multiplied out in every community, and we believe this first recommendation will be carried out by all the people here.

Mr. Albert S. Goss, Master, National Grange, Washington, D. C.: We would endorse everything in the report, but I'd like to call attention to one thing. The recommendation was made for the state and county councils. These will bring our program into a working position, but I do not believe that these state and county councils will happen unless there is some leadership nationally. We should also have a national council made up of the American Medical Association, the farm organizations, the Parent-Teachers Associations and people particularly interested in rural health. It is difficult to create a council here. This group has no authority. It seems to me that a practical approach would be for the group to request the Board of Trustees of the American Medical Association to work with the leaders of the farm and other interested groups and organize a national council which could keep in touch with the development in the states and do other things at the national level to promote the worth while projects outlined in this report.

Mrs. Roy C. Weagley, Maryland: As a representative of the American Farm Federation, I should like to second the suggestion made by Mr. Goss.

Mr. William G. Mather, Pennsylvania: As a rural sociologist, I wish to emphasize that in the organization of these councils and in the planning for the location of hospitals and health facilties it should be remembered that the county is only a political unit. The farmers do not have loyalties to counties. Farmers live in communities. If this program is to be activated, it will have to reach into the community as a community. There is a loyalty there that can be capitalized on. If that loyalty is arbitrarily disregarded by following county or township lines there is an opposition that will also be encountered. I urge you to go with the psychology of the farmer rather than against it.

Dr. D. G. Miller Jr., Morgantown, Ky.: One point that has a great deal of bearing on bringing rural physicians and dentists into the community is to have a community where a doctor's wife is satisfied to live. I made ten attempts before being able to convince a young man and his wife that they could be happy in a town of a thousand population. Rural people adopt new ideas and new persons slowly, and you must live in a community two or three years before they are willing to accept you as one of them and follow your leadership in anything.

Lloyd C. Halvorson, Washington, D. C.: I didn't notice any mention of scholarships for rural students who might want to practice in rural communities. That is something that needs to be considered.

Eleanor Palmquist, R.N., Mississippi: We have done exactly that as far as the medical student is concerned. He has to sign a contract that he will come back to that community and practice a minimum of two and preferably five years. We make loans to a maximum of $5,000 to medical students when they come back to a rural community and practice. He cancels the entire indebtedness to the state if he practices five years.

Report of Committee on Voluntary Medical Prepayment Plans

Dr. James F. Doughty, Tracy, Calif.: As a result of the round table discussion the committee wishes to present the following recommendations:

1. Development of voluntary nonprofit prepayment medical and hospital care plans should be extended on a statewide basis, and such plans should meet the standards set up by the Council on Medical Service of the American Medical Association.

2. Prepayment medical plans should put on an educational campaign to increase preventive medical care and to encourage the development of local public health districts.

3. The enrolment policy should be as broad as possible but actuarially sound.

4. The need for facilities should be studied and provided for by local, state and federal funds as they are developed.

5. To meet the demand of the facilities developed, adequate personnel must be produced.

6. We recommend that provision be made in medical schools and hospital staffs for the training of general practitioners and that local plans be developed to encourage their residence and practice in rural communities.

7. Farm organizations and prepayment medical and hospital care plans should give more study to the development of methods for the sharing of costs for the care of the medically needy.

8. It is recommended that voluntary nonprofit prepayment medical care plans be developed on a statewide basis predicated on local needs, and we base this recommendation on the experience in some eighty-five medical society sponsored plans and some eighty-seven Blue Cross plans throughout the country.

We urge that copies of these recommendations be presented to the Council on Medical Service of the American Medical Association and to the farm organizations for further action.

J. Frank Doughty, M.D., Chairman.
Mrs. Paul Palmer, Co-Chairman.
Carl F. Vohs, M.D.
W. E. Garnett, Ph.D.
Joseph W. Fichter.
Committee.

DISCUSSION

Mr. Graham L. Davis, Michigan: In the last few years laws have been passed in a number of our states which impose restrictions on the freedom to organize voluntary nonprofit prepayment plans. A typical law similar in form to laws which now exist in some ten states requires that the organization of such plans must have the official approval of the state medical society. In a number of states the law provides that the plan cannot operate in any county unless at least 51 per cent of the physicians of the county approve the plan. The earliest law was in New Jersey. Others were passed in 1945 following a similar pattern. Irrespective of the motivation, these laws will have the effect of restricting the initiative of state or local groups to organize voluntary prepayment plans for themselves; and I think that the excellent effort of the American Medical Association in bringing this group together and in the endeavor to win cooperation between farm groups and organized medicine will not be promoted but will be put at a disadvantage by the establishment and continuance of such restrictions. If we are going to have voluntary nonprofit prepayment plans, let us have the broadest possible experimentation. I am not implying that initiative on the part of the people should not be accompanied by every effort to win and move forward with the cooperation of their physicians. Obviously, that is necessary; but a law that places control in the hands only of physicians of the money which is paid by the people for the benefit of those people and which is spent mostly on the physicians themselves is not a wise kind of law.

Dr. Norman M. Scott, Trenton, N. J.: The law in New Jersey, which was the first of its kind, was not instigated by the medical societies in New Jersey. The medical societies of New Jersey simply expressed an interest in trying to solve this problem in their own way. That's what we wanted to do; and when we attempted to do it the Commissioner of Banking and Insurance and the Attorney General said "You will have to have an enabling act because this is probably insurance. If it is insurance and you start to operate or if we consider it this and you start to operate, we'll bring an injunction against you and take it into court. If the court rules that it is insurance, you come under our domination and we write the enabling act. If the court rules it is not insurance, we will introduce a law into the legislature making it insurance." The medical society did not write the act. It was written by the state authorities to allow the medical profession to attempt to solve this problem in its own way as an effort of organized medicine. These acts may all be proved to be unconstitutional. If they are, they are discounted and we operate under the law covering nonprofit organizations. The decision of the state authorities was that it would require an enabling act and they wrote it. That's the background on that act.

Dr. B. J. Branton, Willmar, Minn.: In Minnesota we have an enabling act which covers all the various essential things. It says we must have a nonprofit prepayment medical plan under the enabling act. That word nonprofit to me means considerable. In our state association we spent a year and a half deciding what to do. We came out with two plans. The first plan was the one which would be nonprofit and therefore nontaxable in Minnesota. The second plan, which we are working on now, is to take all commercial insurance companies and bring out from them the finest contract which it is possible to get. We worked diligently on this. Many of us on that committee felt that a group that put on this sort of thing should be men of vision and know what it was all about. We have too many nonprofit voluntary and therefore nontaxable institutions in Minnesota. We have two ways of solving this in Minnesota. The first one is by taking cognizance of the fact that the Blue Cross has done beautiful work and by using the organization to help us in the carrying on of this business. Another way of going in this is by using facilities already available to the people of the state in buying voluntary prepayment medical and hospital care through the insurance carriers who are already in their field and paying their money to take care of the tax which we have to pay in the state of Minnesota. It seems that certain of the nonprofit organizations feel that they do not come under the insurance commissioner of the states in which they propose to operate. To carry on on an insurance level successfully, we should come under the insurance commission. I would say that in the states where it is necessary to have nonprofit, nontaxable prepayment plans, let them have it; but where it is not necessary, it shouldn't be. I believe that that word nonprofit should be deleted from this recommendation.

Dr. R. W. Fouts, Omaha: I had hoped that Drs. Scott or Branton might have said something in defense of the medical profession in connection with the recommendation of Mr. Davis.

If I understood correctly, the inference was that the medical profession who must deliver all of this medical service was standing in the way of the initiative the laymen and rural organizations might take in organizing prepayment medical insurance plans because we who must deliver this service insist that it be delivered under conditions that are satisfactory to the ethics and traditions of our profession. We have had in some parts of our country some experiences, and some of them are not ironed out yet so far as the Blue Cross plans are concerned or some of the medical services that they started out to render because of the fact that these Blue Cross plans are administered by laymen, and particularly hospital men who quite naturally will act to extend the scope of hospital activities in many instances to the point where it becomes the practice of medicine. That might easily happen to any medical service plan that might become dominated by hospital administrators or lay people who do not have the medical point of view. There is a reason why the medical profession insists that all medical plans receive the approval of the majority of physicians of that particular locality before they can receive the stamp of approval of the Council on Medical Service of the American Medical Association.

Mr. Joseph W. Fichter, Ohio State Grange, Columbus, Ohio: I share the sentiments of every one who has spoken from the farm groups that we feel that the American Medical Association has done a most constructive thing in inviting the farm organization representatives to participate in this conference and to represent a move that will bear fruit in a constructive way if similar meetings are held on a state or county level. However, I think the value of this kind of thing lies in the possibility that every one concerned can feel that the other fellow is approaching it with an open mind. If I were to have the temerity to make a suggestion about a conference of this kind, it would be this. If they are called on a state or local level, the medical profession should be not too much concerned about getting the farm groups or anybody to agree for the moment with what the medical profession thinks ought to be done. All of us are a little too much concerned with who is going to control the general setup of our health care program. It doesn't matter much what recommendations come out of this conference unless the people who receive them have full faith that you and I have entered this conference with an open mind and that neither group has any desire to persuade the other group before it is ready to be persuaded to see the other's way. I think that is tremendously important.

The recommendation made by Mr. Davis is excellent. The following resolution was adopted in the National Grange meeting: "Medical prepayment plans should be primarily controlled by the consumer or patient." There we have it—the National Grange by resolution taking that position, the medical profession taking the other position. Those of us in the Grange until the next meeting are bound by this resolution. It seems to me that, meeting here for two days, maybe both of us can find it is worth while to make some concession. One of the most constructive steps the medical profession could take would be to join with the farm groups in recommending that if legislation is introduced in the legislature it is a census of this group that the restrictive legislation ought to be done away with and the field opened up for consumers of health service to set up some different plan.

Mr. Harry L. Graham, Indiana Grange: The farm folk are interested in being able to pay for these services ourselves and we want a way over which we'll have some control. We don't want standards to go down. We know what it is to have poor hospital service or no doctors at all. We know what it is to go on low standards. We want them built up and expanded so the little people in the country get your kind of service; and I think the time has come when the medical profession should try to see our point of view on it and to have some faith and trust in the good sense and judgment of the farm folk. They faced this problem a long time when the medical profession didn't seem to be interested in it. We want to pay the doctors for their service but we must not and you must not sponsor legislation which will prohibit doing the thing which we want to do and what you need done for yourself.

Mrs. Jerome Evanson, North Dakota: The state level is where these suspicions are aroused. In the matter of state legislation, we were given the cooperation and the assurance that the medical association will go along on a bill to help bring better health facilities to our rural people. Then our secretary sees fit to have brought before the legislature another bill nullifying all the work that we are doing and instituting a bill in which the medical group will have a veto over anything passed by lay people in an advisory council. The meeting here is going to do no good if when we go back to our states we have the same fights on and the lip service but not the actual cooperation that is necessary to get the job done.

Dr. Page Jett, Prince Frederick, Md.: When we were fighting the great war we didn't say "Who is going to control it?" We doctors are delivering this service just as the Army and the Navy delivered service in the war. All we ask is that we shall not be hamstrung by lay groups who do not know the problem as we do, just as the Army was not hamstrung by people who did not know how to fight.

Report of the Committee on Nursing Needs of Rural Communities

Mrs. Charles W. Sewell, Chairman, and Charles W. Holman, Co-Chairman: There is a shortage of nurses, and classes for schools of nursing this fall have enrolled little more than half of the number required. With a desire to improve this situation the Committee on Nursing Needs in Rural Communities makes the following recommendations:

1. Education for later life must begin in the home, where attitudes toward real service to humanity must be developed.

2. Expansion of home nursing courses in high schools and adult education courses should be encouraged. This not only helps individuals to help themselves in time of need but is a means of recruiting students for schools of nursing.

3. Education for nurses should utilize hospital service as far as this service is educational. Such programs might well be augmented by the use of public funds. On the basis of the experience of the Cadet Nurse Corps, the course might be shortened and consideration given to student nurses being assigned to rural hospitals for part of their experience.

4. Practical nurses are urgently needed. This health worker too should be trained and licensed for the protection of the patient.

5. Improve the status of nurses in rural communities in regard to working conditions, professional recognition, opportunity for advancement and continued professional development.

6. Give compensation commensurate with the education required and the quality of service given.

7. The rural people who pay for and use nursing services working with the nurses in local communities can do much to improve the situation. It will take the combined efforts of rural people through their organizations and the professional association of physicians and nurses to solve these problems.

DISCUSSION

Mr. Graham L. Davis, Michigan: In Michigan we think there should be two types—the registered nurse and the practical nurse, or nurse's aide. We can't recruit them under present conditions, so the approach we're making is through our state department of education. Our state universities and colleges have a definite responsibility in that field. So we're working toward these nurses being registered as students at the university and then using the hospitals, even the small units, for practical experience, but they're students at the university. In that way we shall introduce these nurses to our smaller hospitals and perhaps solve this problem of adequate nursing service for the communities that we have.

Dr. G. F. Moench, Michigan: As a representative of the Health Committee and of the National Congress of Parents and Teachers I want to call attention to a problem that we run into when trying to develop our program, shortage of personnel and shortage of facilities. I have worked in a rural community all my life. These problems must be solved as a local problem as well as on a state and national basis. There are local resources at our command in every little community if we'll just look around. There are more millions of people represented in some 30,000 units of the Parents and Teachers Association; and in these communities there are schools. The school house furnishes a meeting place for people. Don't forget that the Parent-Teachers Association can be a valuable resource when it comes to working out programs.

Dr. W. L. Burnap, Fergus Falls, Minn.: I have a different view on the nursing problem than that presented. The lack of registered nurses presents a problem dangerous to the hospitals and physicians and the people. The girls are not entering nursing courses, and there are several reasons. One, the ease with which girls from high school can secure employment. There is poor pay for well trained nurses. This situation is the result of the war economy and will adjust itself. The chief cause, we in the rural areas feel, is the unnecessary demands made on the girls by the courses offered in a city hospital. Some years ago there were three year nurse training courses in many of our rural hospitals, two years at home and one in the city hospital. This arrangement provided adequate nurses in adequate supply. This desirable arrangement was arbitrarily terminated by some authorities at the top. There are two reasons why the rural hospitals are successful. The courses are so arranged that the girls can earn their own way. The present plan for licensing nurse's aides might help some but does not solve a real need for registered nurses. There is a solution. Establish a nurse training course in rural hospitals with affiliation with city hospitals. This plan has succeeded and is now succeeding where given the chance.

Report of the Committee on Health Council as Agency for Promoting Rural Health

Dr. J. Paul Jones: This committee believes that a health council should be composed of representatives from three groups: (1) those allied and auxiliary professional groups who render health service, (2) those who receive health services and (3) those governmental agencies officially concerned with health and medical care and also including those voluntary agencies manifesting a continuing interest in health and medical care.

Objectives of Health Council

1. To bring together medical and allied professional and citizen groups to the end that discussion, debate and interchange of opinions and planning of health and medical care may be effected.

2. To encourage, stimulate, foster and support the establishment of health and medical care councils in areas as deemed advisable within each state.

Functions of Health Council

1. To survey medical care and health needs.

2. To determine the existing and needed facilities and personnel for meeting the findings of the survey.

3. To recommend ways and means of providing adequate facilities and personnel to meet the constantly changing needs.

4. To disseminate as widely as possible information pertaining to health and medical care problems and programs.

5. To conduct or promote such meetings as may be helpful in effectuating the program.

This committee recommends that the Rural Health Committee, through the Council on Medical Service of the American Medical Association, provide cooperative assistance to interested state and local groups in establishing health councils.

J. Paul Jones, M.D., Chairman.
Lloyd C. Halverson, Co-Chairman.
Frank Peck.
Miss Winona Darrah, R.N.
V. V. Mitchell.

DISCUSSION

Miss Helen Becker, College of Agriculture, Nebraska: The existing agricultural agencies on the state and local level actually bring to the people education of a health nature. The existing facilities to which I have reference are the land grant colleges through the extension service. In Nebraska we have already done a great deal. The Nebraska State Health Planning Committee, which is actually a health council on the state level, brings together the best thinking of the state university college of medicine, the state department of health representatives from the organizations such as have been mentioned and others. Through this committee we disseminate information through the extension services, the 4-H Club and the women's project clubs. In the next two weeks I shall go on seven community health institutes—one day institutes—in the state of Nebraska. I believe that, because we have some 5,000 county agents in the United States, all states may use these facilities to great advantage.

Dr. Charles R. Henry, Little Rock, Ark.: In Arkansas in developing our prepayment health program we consulted with the leaders in the farm bureaus, the FSA and the extension service of the University of Arkansas. The extension service and the farm bureau in Arkansas have been studying ways of bringing better health to the rural communities. Last summer the director of the extension service called a meeting of doctors, dentists, hospital administrators, community leaders, public health workers and others. This group eventually will develop into our state health council. The group recommended that a health specialist be employed by the extension service to provide leadership in the communities in the development of a rural health program. This health specialist has been working since last October and conducts such institutes as Miss Becker says they are conducting in Nebraska. This health specialist interprets to the various groups and organizations Public Law 725. He interprets to community leaders and the people of these institutes prepayment health programs and also the existing health facilities in the community. He points out the need for rural boys and girls entering the health field and, above all, community responsibility in utilizing the facilities that are available. In Arkansas we have already completed the health and hospital survey.

Mr. Albert S. Goss, National Grange, Washington, D. C.: It is important that the American Medical Association has brought these groups together. I think the same thing can be done on a county level. I worked with farmers for thirty-five years. Much of it was in the field of insurance. Farmers do not want poor insurance, or poor or unpractical health programs; if competent medical men will participate in these county councils and state councils, the doctors need not have any fear of the kind of program which will develop. The reports of this committee and of committee two for setting up these county councils are the answer; and if we actually want the county councils in the spirit we have here, I have no doubt the whole field of prepayment of medical service will be advanced and these differences which have been expressed today will disappear.

Miss Eleanor Palmquist, R.N., Washington, D. C.: The Joint Committee on Community Nursing Service has prepared a guide that I think will be of help in your local councils in considering the nursing problems. This pamphlet can be secured from the Joint Committee on Community Nursing Service, 1790 Broadway, New York 19.

Mr. John H. Davis, Washington, D. C.: I represent the National Council of Farm Cooperatives. I want to endorse everything Mr. Goss has said and the others who have spoken for the county council. I think we need them rather soon. When the farmers of the country begin to demand something new as they are now, something better in the case of health and medicine, it is easy to look on that as an attempt to take over. Actually I think it is very different; it is a challenge to do a better job. If we succeed in bringing to those people something better, the end result will be more and better jobs to the medical people.

DR. W. E. GARNETT, Virginia: In Virginia we have had for years the state council, which has something over forty statewide organizations supporting it. We have sponsored and conducted a study of rural medical care needs. We have under way an intensive study of the insurance needs from the rural point of view. The important thing that we have found through this council is a very intensive educational campaign with meetings in communities over the state and circulars widely distributed. We are hoping to move to the county level shortly.

MR. EDGAR A. SHULER, Michigan State College: I think one of the basic problems is an educational problem. Dr. Hoffer at Michigan State College has prepared a report on this work that he has been doing for the past year, which I think might be of interest to you. This schedule or questionnaire attempts to help farm people know when they are in need of medical attention. It doesn't attempt to diagnose the condition, but it does attempt to point out that often we need to go to a doctor early before we're flat on our backs.

DR. CHARLES H. LERRIGO, Topeka, Kan.: I am a physician who has been in Kansas for forty-seven years, seventeen of which were spent almost entirely in rural practice. No one seems to have recognized the great help that will come to you from the tuberculosis and health associations. I suggest that you call in your tuberculosis and health associations as representatives at all your councils. They can give you a lot of health literature. They will provide health education circulars.

FATHER E. D. BUTT, Tennessee: I am rather surprised that nothing has been mentioned about using the churches as a means of disseminating information. In a rural church of which I was pastor in Tennessee we had a rack for pamphlets relating to the Christian life, such as one finds in all churches. Also in this rack we put pamphlets which we got from the county health departments. By having these available in the church we were disseminating them among people who never have got these pamphlets from the health department. As one who has spent most of twenty years in the rural pastorate, this conference is to me one of the most uplifting experiences that I have had recently. I think that on every state or national or county health conference there should be a competent delegation from the churches and that news about this conference, about the plans of this conference, should be put into the hands of every rural pastor of every denomination of every church.

Report of the Committee on Medical Care for Lower Income Groups

MR. OWEN COOPER, Jackson, Miss.: The findings of this committee are based largely on the discussion yesterday by a distinguished group of men who joined this round table. The group met to discuss the medical needs of lower income farm groups. Medical care was defined as preventive, diagnostic and curative services. Lower income groups were defined as those unable to pay the full cost of complete medical care. This broad definition led to difficulty later in determining the means by which such a group might best provide itself with medical care. The following methods and factors were discussed as ways medical care is now extended to the lower income group: 1. Sliding scale of fees whereby physicians adjust their fees in accordance with the patient's ability to pay. 2. Prepayment medical care plans. 3. Tax supported systems for the care of the indigent. 4. Philanthropic and other private agencies. Following discussion of the factors enumerated the group acting as a committee of the whole made the following recommendations: 1. Expansion and increased effectiveness of state and locally supported public health programs, implemented when necessary by federal funds. 2. Expansion and improvement of tax supported systems providing adequate medical care for the indigent and medically indigent. 3. Development of prepayment plans as a contributing factor in the solution of the problem. 4. That there should be no difference in the standards or adequacies of medical care regardless of the income of the patient. The committee makes the following suggestions based on the discussion which was not solidified into definite recommendations:

1. That the health of this lower income group depends in a large part on economic factors such as the provision of adequate housing, adequate clothing and adequate food, and that the correction of this defect depends on the raising and maintaining of the economic level of this group.

2. The committee calls attention to the fact that the definition of the lower income group as given by the conference would probably include about 85 per cent of the population.

3. That a comprehensive study be made of the effective medical care tax supported plans now in operation.

4. That cooperative health associations be expanded and developed on a community level to meet local problems.

5. We believe the issue now facing us is the choice between a system based on voluntary plans supplemented by tax subsidy, applied to the individual, involving a means test, or the adoption of a national personal health service program, supported by taxation. (This may mean income tax, pay roll deduction, or other personal assessment, combined if necessary with some general tax funds.)

OWEN COOPER, Chairman.
EDWARD MERTZ, Co-Chairman.
MISS ELIN ANDERSON.
CLYDE YORK.
NORMAN SCOTT, M.D.
COMMITTEE.

DISCUSSION

MR. W. E. GARNETT, Virginia: As a representative of the Virginia Agricultural Experiment Station, a few years ago I made an intensive study of this question. In many states the extension service reaches relatively few. I want to emphasize the importance of following up the report of this committee as well as of the committee on prepayment medical care. We found that the poor group averaged more than a third more children than an equal number of families of higher standards and that much of the future population of the country is being reared in these poor homes, where there is only inadequate medical care. We have found that this group needs better medical care than most and are least able to provide it.

REV. ANTHONY J. ADAMS, Rural Life Director, Institute of Social Order, St. Louis: The farm organizations for the most part have their health programs, and they have met opposition on the part of the state health boards. I have in mind a number of instances where the people have the committee, they have a couple of doctors on the board, they had nurses, they were prepared to start a cooperative hospital. They sent in their petition. They got no word for several weeks. They finally got their check back and a note saying that the state legislature could not permit a cooperative group to set up a hospital. The directive had to come immediately from the association—the medical association—which stymied the whole thing. The Catholic priest who was pastor in that town, the Methodist minister with his group, the local doctors and nurses had all worked on that. A central committee could iron out some of those difficulties. While I endorse this idea of a central committee, let us use it to strengthen our local committee. The more we centralize control the more likely we are to end up with socialized medicine. We'll fight to the last ditch with the American Medical Association in trying to forestall socialized medicine; but we want to see that cooperation in fostering local groups who are willing to help, who can give the help and who will give the help if they are permitted.

DR. F. S. CROCKETT, Chairman, Committee on Rural Medical Service, American Medical Association: On the national level here we can plan; but to get action it must go out into the states and counties. For that reason we have asked each state medical society to appoint a state committee on rural health; and some thirty-five or thirty-six have done that; and many of them have sent delegates to this meeting. It is expected that within each state that committee will get into close cooperation with the organized farm groups of that state.

None of us know the answer to these things. We are trying to find them out, and we will probably find them in the hard way. We look forward eventually to success.

Mr. Goss speaks of a National Council of Rural Health. Tonight when my committee meets I can take that up with them and see what we can do with the idea. I am very grateful to Mr. Goss for making that suggestion.

Following the end of the formal program I want the doctors who are here from every state, members of all local state committees on medical service, or other doctors who were sent probably to represent that interest, to talk over among ourselves what we can do and what we might be able to do in the states and in the smaller subdivisions of those states. We're impressed with the fact that so many from many different walks of life are interested in this problem. I am grateful to you who have expressed your views.

Address of J. Melville Broughton, Ex-Governor of North Carolina

Dr. Crockett then announced that Ex-Governor J. Melville Broughton of North Carolina could not be present. However, he sent an abstract of his talk, and Dr. George F. Lull, Secretary and General Manager, American Medical Association, read the address.

Dr. Lull: At the request of your chairman I will read this abstract of Mr. Broughton's address.

The good health of our citizens is a state and national responsibility. Any program for our national economy that omits health as an essential factor is unbalanced and unsound. The most important "next step in a health program" is to obtain general acceptance of these and related principles by state and national legislative bodies and by the public. Good health is not only a vital part of our national economy; it is our first line of national defense.

These factors were responsible for the passage of the Hill-Burton Federal Hospital Construction Act in July 1946. It is the first time any federal appropriation has ever been made for civilian hospital construction wholly under state or community management and control. It may well mark the beginning of a new era for good health in America.

Doctors and medical associations who have, with justification, opposed "socialized medicine" or "federalized medicine" have with almost complete unanimity accepted the principles and provisions of the Hill-Burton Act. Thus has been laid the foundation for a broad program for good health. Among other steps which should ensue may be the following:

1. The provisions of the Hill-Burton Act should be broadened and appropriations increased in a manner to make certain that full benefits will be experienced by rural areas.

2. Public schools should be required by state laws to give adequate instruction in health and personal hygiene and in home and community health and sanitation. Such instruction should extend to elementary, grammar and high school grades. The selection of textbooks for such instruction should not be left to politicians or even wholly to teacher-boards or commissions. State or other competent health authorities should participate in such selection.

3. Every child in a public school should be physically examined annually by a competent physician at public expense. Where such examination reveals the need for medical or surgical treatment, the parents should be notified. Where poverty or inadequate income prevents the parents from obtaining needed treatment for the child, it should be provided at public expense. In such programs the principle of individual selection or designation of physician or surgeon should be preserved. The fullest cooperation of medical groups in the instructional and clinical phases of the program should be invited and will undoubtedly be given.

4. State legislative bodies should make adequate appropriation for adequate medical care and hospital programs, with full provision for all rural areas and other sections not now adequately served. Appropriations so conditioned as to be unavailable to rural or other areas unable to provide a pro rata contribution, by tax or otherwise, will not solve the health problem. State legislation should be so designed as to take full advantage of the provisions of the Hill-Burton Act and other similar federal enactments.

5. In such a broad health program there can be no place for racial, religious or other discrimination.

6. The widest encouragement should be given to so-called Blue Cross hospital and medical care plans and similar agencies in various industrial groups. Such plans or agencies when adequately regulated and supervised in the public interest are a protection and at the same time encourage thrift and self reliance.

7. The word "indigent" or "charity" should be eliminated from the good health program. It carries something of a stigma that tends to keep away many people who should have the benefit of hospital care.

8. Increasing emphasis must be made on local responsibility and opportunity. The time for looking to Washington for the solution of all our problems is past. The relationship between nation, state and community should be one of cooperation and coordination. No community without a hospital or health center should think of any other form of memorial for the war heroes.

9. The shortage of physicians in rural areas threatens our whole standard of health in the nation. Inducements, gratuities, scholarships and the like may help some, but ultimately the only solution will be more hospitals and health centers in rural areas.

Comment by Mr. Watson Miller

Dr. Crockett then introduced Mr. Watson Miller, Washington, D. C., administrator of the Federal Security Agency, who said: It so happens that for about two decades I have been on the threshold of medicine. I have been the beneficiary of an unusual amount of skilful surgery, medical treatment, dentistry and effective nursing. I have had sense enough not to try to invade the profession and not prescribe for other people or myself. I am very zealous for American medicine. I shall never consciously do anything to delay it or harm it. On the business of health in rural communities, I don't think that differs in any important aspect from what we are all considering—just more medicine for more people.

Maladjustment in Medical Service

Dr. H. H. Shoulders, President, American Medical Association: There are many causes or factors which play a part in bringing about the state of maladjustment in individuals and in the conditions with which we are concerned today. Obviously it is not a specific disease for which a specific remedy is available—a single remedy which could be administered with assurances of a certain and speedy cure. It is therefore appropriate for us to think for a moment on a few of the causes which have contributed to the state of maladjustment which exists in medical service. All I can hope to do at this time is to contribute a few thoughts to the thinking that is going on and the questions that are being raised at this conference. I certainly do not hope to give you a specific remedy, for the simple reason that no such remedy exists. It is a situation which must be dealt with symptomatically. Many different means may be required in the management of the situation. At one time it may require sedation of various sorts and at another time it may require stimulation of various sorts.

One of the causes of our problem is illustrated by a story I heard from a reliable source some time ago. It is about a country doctor who was located at a country crossroads in one of the states in the Middle West. He was happy there and busy, but the roads over which he traveled on horseback or by buggy became paved roads. The farmers bought cars and so did he. In a short while he was not busy. He discovered that his patients were going to the town a few miles away for their medical care. He then posted a notice on his office door that he was going to town. The people in the community made a loud protest. His reply to their protest was that many of them were going to town for medical care, since the roads had been improved, and that they were calling him only at night or in emergencies or when the snow was too deep for the town doctor to visit them. This fact they could not deny. He did move to town and the people of that community became his patients again and he served them from and in the town.

This story could be repeated times without number, and this is one of the causes of the maladjustment we have at the present time. It is a cause also for the sense of maladjustment where no serious maladjustment exists, for the simple reason that the convenience of medical care often receives more emphasis in the minds of some people than the efficiency of medical care.

Another factor of great importance is the progress that has been made by science and invention. The whole pattern of rural life has changed, and the whole pattern of medical care has changed also, owing to science and invention.

The country doctor went on horseback or buggy. He often raised the feed for his horse. He carried most of his equipment with him. He was a good fellow, devoted, kind and generous and, I say, capable. I would not detract from his memory. I have respect, yes, reverence, for his memory. He was near the people and very successful. The sense of nearness was satisfying. They measured distance in miles then and not in minutes. But in all this I must not forget and you must not forget that the country doctor of whom I speak could not prevent or cure typhoid. He visited his patient daily for a period of six to eight weeks, and the mortality was high in spite of all he could do. He could not prevent or cure diphtheria. He had a fracture case occasionally, and he set fractures of arms and legs without the aid of an x-ray. He got many bad results but was not blamed for them. He did the best he could. Today he would be sued for malpractice if he gave the same treatment with the same results, not only that but the people themselves would not stand for it. Today the doctor cannot carry all his equipment with him. A diagnosis may involve many laboratory tests. He travels by automobile and can reach a point 10 miles from his office in less time than he could travel 2 miles on a country road. At that time a woman in labor was sent to the hospital occasionally for a complication. Today it is the rule for women in normal labor to go to the hospital.

Years ago many doctors in towns throughout the country built their own hospitals, equipped them and operated them as private institutions. They did two jobs, furnishing both medical care and hospital care. Many communities were slow to develop a sense of civic duty. They were not quick to develop facilities for their own interest and care. I could name many small institutions that have closed in the last ten to fifteen years.

The pattern of medical practice has changed in another important way. The diseases that required most of the time and interest of the rural practitioner many years ago have disappeared. You rarely see a case of typhoid now, but, on the other hand, fractured arms, legs and backs from automobile accidents occur with increasing frequency. I noticed in the paper a few days ago that there were 100,000 deaths from accidents last year, to say nothing of the millions who were thus injured and survived. In addition to this, many diseases which were rarely ever recognized and treated in those years are recognized and treated effectively today, though the diagnosis and treatment involve the use of facilities and equipment and knowledge unknown to the doctor of early days.

So the location of a doctor at every crossroad in this country would not, in my opinion, solve the problem of efficient medical care. It is a good, well trained doctor, plus equipment and plus facilities which are reasonably accessible by modern methods of transportation which will make adequate and efficient care available. We must not allow our sense of convenience and our desire for convenience to impair our appreciation of efficiency.

This fact was impressed on me some months ago as a result of a conversation with a man I regard as a great farm leader, a man many of you know, Mr. J. Frank Porter, who was president of the Tennessee Farm Bureau until a short time ago. He and I were discussing this problem, and he remarked with great emphasis that the town of Williamsport, Tenn., was in urgent need of a doctor and he gave apparently logical reasons for the statement. At one time three doctors were there. One moved away, one died and the remaining doctor was getting old and feeble. Mr. Porter lives on a fine farm near the village of Williamsport. This town has a population of 112 people. It is surrounded by a thickly settled community in one of the best farming sections of middle Tennessee, and in one of the best counties in Tennessee, Maury County. It is just 12 miles from Columbia, the county seat, which is a town with more than 10,000 population. There are many fine doctors in the town of Columbia and a good hospital and a full time health unit. Mr. Porter has an office in the town of Columbia. A fine paved road connects the two towns, and he covers the distance between them in twenty minutes traveling at a moderate rate of speed. There are, of course, no modern facilities for medical care at Williamsport.

I think Mr. Porter gave a very natural and laudable expression of a community interest as well as a personal interest, but I don't doubt that his thinking was colored to some extent, at least, by the convenience and satisfaction of having a country doctor near at hand even though he patronized the doctors in Columbia and in Nashville when the occasion arose.

Another factor to be considered is that patients, even seriously ill patients, can be moved long distances with speed and comfort and receive better care at the end of their journey than they could have received at home in the old days. Modern inventions have produced modes of patient transport that are efficient, speedy and comfortable. The location of a country doctor at Williamsport would not, in my opinion, solve the medical problem of Williamsport. It would satisfy a sense of need but not supply a complete need regardless of the individual capabilities of the doctor.

This whole idea of allocation of funds was begun for the purpose of demonstrating to the people their benefits and with the idea that the aid could be withdrawn, once an effective demonstration had been conducted. Mind you, I do not recommend the abandonment of the full time health unit, but I must urge the abandonment of a policy which governs the allocation of funds. At frequent intervals we see reference made to the approximately twelve hundred thinly populated poor counties without a full time health service, and this fact is cited as a reason for more appropriations when it is in fact a reason for the alteration of a policy.

I will say also that any opinion to the effect that the people in a county or area without a full time health unit are for that reason without preventive medical services is a very erroneous opinion.

The fact is that, when science developed and perfected means for the prevention of several diseases by vaccination or inoculation, the private practitioners of medicine began their extensive use. I dare say that more preventive medicine of this type has been administered by private practitioners of medicine than by all other agencies combined. It was not the simple regulation which required children to present a certificate of successful vaccination on entering school that accomplished the control of smallpox in this country many years ago, it was the continuous preventive efforts on the part of the general practitioners of medicine.

I wish to make this further observation—that the two groups of people who, in my opinion, should work out the treatment of this maladjustment are at this conference table. They are the representatives of the medical profession and the representatives of the rural people. From this conference then should grow and develop a type of consideration and cooperation which will in time determine what the local needs are, their character and the amount. The matter of voluntary prepayment medical service and insurance plans, in my opinion, can serve a vital function in the financing of the major costs of medical care, and they can accomplish it without hardship on individuals and with the complete preservation of individual independence and without destroying, or even impairing, the vital relationship between patients and doctors. The voluntary hospital prepayment movement is accomplishing the same thing.

THE TAFT-SMITH-BALL-DONNELL NATIONAL HEALTH BILL

An Analysis Prepared by the Bureau of Legal Medicine and Legislation

A revision of the bill sponsored in the Seventy-Ninth Congress by Senators Taft, Ball and Smith was introduced in the Eightieth Congress on February 10 as S. 545, with Senator Donnell of Missouri as an additional sponsor. In general framework the new bill is similar to the earlier one. Its title, however, follows too closely the title of its predecessor and will need revision. It indicates, among other things, that the bill will promote and encourage medical research in the National Institute of Health and through grants-in-aid to the states. The provisions in the earlier bill that would have accomplished such a purpose have been eliminated from S. 545.

The new bill proposes, as did the one introduced in 1946, to enact a "National Health Act" and is pending in the Senate Committee on Labor and Public Welfare, of which Senator Taft of Ohio is chairman. Several changes noted in S. 545, as compared with the first bill, merit initial comment. In the pending bill it is provided that the administrator of the proposed National Health Agency must be "a doctor of medicine, licensed to practice in one or more of the states and who is outstanding in the field of medicine." In the initial bill the administrator was to be either (1) a doctor of medicine with at least eight years of experience in the commissioned corps of the Public Health Service or (2) a doctor of medicine licensed to practice medicine or surgery in one or more of the states, who has had at least five years of active practice and three years of experience in a responsible position in medical research, teaching or administration.

In the bill introduced in the Seventy-Ninth Congress the United States Public Health Service, acting through the Surgeon General, was designated as the administrative agency on the federal level in relation to state programs to provide medical and hospital care for families and individuals of low income. The present bill provides for the establishment in the proposed National Health Agency of an Office of Medical and Hospital Care Services to supervise the administration of state programs. As director of this office will be a doctor of medicine who has had at least five years of active medical practice and who is outstanding in the field of medicine.

A new section in S. 545 will authorize an appropriation of $3,000,000 to assist states in surveying the availability of existing medical, surgical and hospital care to persons unable to pay in full therefor. Another new section would authorize an annual appropriation of $10,000,000 to develop more effective means for the prevention and control of cancer. Other differences between the original bill and S. 545 will be reflected in the analysis that follows.

DECLARATION OF FINDINGS

The necessity for the enactment of S. 545 is predicated on this declaration of findings set forth in section 2: (*a*) that health and medical functions are widely scattered throughout many agencies in the federal government, with resultant confusion and duplication of effort; (*b*) that inadequacies exist in the distribution of public health services and of medical and dental services in the United States, with the result that some persons are unable to secure adequate health and medical services; (*c*) that it is the policy of the United States to aid the states, through consultative services and grants-in-aid, to make available medical, hospital, dental and public health services to every individual regardless of race or *economic* status, and (*d*) that it is the policy of the United States to make provision for voluntary deductions from the salary of federal employees of premiums directed by them to be paid to voluntary nonprofit health insurance funds.

NATIONAL HEALTH AGENCY

Title I of S. 545 proposes the creation in the executive branch of the government of an independent agency to be known as the National Health Agency, to be administered by a national health administrator, appointed by the President, by and with the advice and consent of the Senate. His salary will be $15,000.

Qualifications of Administrator.—The administrator will not be permitted to engage in any other business, vocation or employment. He must be a citizen of the United States and "a doctor of medicine licensed to practice in one or more of the states and who is outstanding in the field of medicine."

Purposes and Duties of Agency.—The agency will promote the general welfare of the people of the United States by aiding and fostering progress throughout the nation in the field of health and medicine and by centralizing in it the activities of the federal government relating to health.

It will be required to (1) encourage the development throughout the nation of health services and facilities; (2) advise and cooperate with other agencies and departments of the federal government and with state governments and agencies, and with private agencies functioning in the field of health; (3) collect and analyze statistics and make studies, investigations and reports on conditions, problems and needs in the field of health in the United States and in other countries, and disseminate and make available information in this field; (4) make reports and recommendations with respect to the most efficient policies and methods for the promotion of health and related services, and (5) carry out such specific duties as may be entrusted to it by the Congress and exercise general supervision over the agencies transferred to it. Under the original bill the agency would also have been required to make recommendations with respect to legislation and matters of administrative policy.

On this agency will be devolved the responsibility for federal governmental activities concerned with (1) the administration of funds appropriated as grants to states for medical and hospital care, dental care, hospital facilities and all other health activities; (2) the prevention of disease through water purification, sewage treatment and the elimination of lake and stream pollution, and promotion of research toward this end; (3) the promotion of maternal, prenatal and child care, and the study and dissemination of information on child growth, development and nutrition; (4) the protection of the national health by promoting purity, standard potency and truthful and informative labeling of foods, drugs and cosmetics; (5) the administration of the Hospital Survey and Construction Act of Aug. 18, 1946 (a responsibility that was not devolved on the agency by the initial bill), and (6) such related matters as shall aid the states and the people in the maintenance of adequate and efficient health facilities and otherwise promote the national health. The bill as printed devolves another responsibility on the agency, namely the training and rehabilitation of persons vocationally handicapped because of permanent disability with the objective of placing such persons in remunerative employment. It is understood that this provision appears in the bill by inadvertance and that this duty will be exercised, as at present, by the Federal Security Agency.

Transfer of Functions to Agency.—There will be transferred to the agency the following agencies, their functions, powers and duties: The United States Public Health Service, Saint Elizabeths Hospital and the Food and Drug Administration. There will also be transferred the functions and duties of the *Children's Bureau concerned with the administration of title V,* parts 1 and 2, of the Social Security Act and the functions and duties of the Division of Health Studies in the Bureau of Research and Statistics of the Social Security Administration. No power, function or duty exercised by the Army, the Navy or the Veterans Administration will be transferred to the agency, nor will the agency nor any constituent unit thereof be deemed to have been granted any power, function or duty other than those specifically transferred.

The director of the Bureau of the Budget will be directed to make a study of the activities of the other departments and agencies of the federal government to determine whether any of their activities relating to health, not specifically transferred, should be transferred to the agency. He will be required to complete such study and to submit a report of its result to the Congress by Dec. 31, 1947.

Units of Agency.—In the agency there will be the following constituent units: (1) the office of the Administrator; (2) the Public Health Service, which in turn will assume the administration of Saint Elizabeths Hospital and Freedmen's Hospital; (3) the Office of Medical and Hospital Care Services (a unit not provided for in the earlier bill); (4) the Office of Dental Care Services (a unit not proposed by the earlier bill); (5) the Office of Maternal and Child Health; (6) the Office of Health Statistics; (7) the Office of Food and Drug Administration, and (8) such other constituent units as the administrator finds necessary. The earlier bill also provided for an Office of Vocational Rehabilitation which is omitted from the pending bill. The organization of the Food and Drug Administration will remain unchanged except as it may conflict with the specific provisions of this bill.

The Surgeon General of the United States Public Health Service will be appointed as provided in section 204 of the Public Health Service Act. The heads of other constituent units of the agency will be appointed by the administrator.

Qualifications of Director of the Office of Medical and Hospital Care Services and of the Office of Dental Care Services.—The director of the Office of Medical and Hospital Care Services will be a doctor of medicine licensed to practice medicine in one or more of the states, who has had at least five years of active medical practice and who is outstanding in the field of medicine. The director of the Office of Dental Care Services will be a doctor of dental surgery who has had at least ten years of active practice and who is outstanding in the field of dentistry.

Advisory Council on Maternal and Child Care.—Within the Office of Maternal and Child Health there will be an Advisory Council on Maternal and Child Care to be appointed by the administrator. This council will advise and consult with the head of the office in the formulation and administration of the medical and technical activities of the office. It will be composed of eight members, at least three of whom shall be doctors of medicine and specialists in obstetrics or pediatrics. In the section relating to this advisory council a reference is made on page 10 of the bill, line 11, to the Surgeon General. This reference, it is understood, is a drafting error, and the term administrator should be substituted for the term Surgeon General.

Studies and Reports by Administrator.—The administrator will be required to submit to the Congress and to the President in writing annually a report giving an account of all moneys received and disbursed by him and the agency, describing the work done by the agency and making such recommendations as he may deem necessary for the effective performance of the duties and purposes of the agency.

A new provision will require the administrator to make a study of the organization and staffing of the agency and, within six months after the effective date of the act, report to the Congress his findings and recommendations for promoting the more efficient and effective operation of the agency. Such studies will cover all aspects of the organization and staffing of the agency and of its constituent units and will include (1) salaries, (2) the desirability of retaining or modifying the commissioned corps of the Public Health Service and (3) the desirability of establishing an Office of Health and Medical Research as a constituent unit of the agency.

Appropriations.—There will be authorized to be appropriated for the administrative expenses of the agency for each fiscal year such sum as may be necessary.

Effective Date of Title.—Title I of the bill will take effect July 1, 1947. The administrator, however, may be appointed by the President, and his appointment confirmed by the Senate, at any time after the enactment of the bill, but the appointment will not take effect until July 1, 1947.

PREVENTION AND CONTROL OF CANCER

The pending bill contains a new provision authorizing an annual appropriation of $10,000,000 to enable the Surgeon General of the Public Health Service to develop more effective measures for the prevention and control of cancer and to assist, through grants to states, counties, health districts and other political subdivisions of the states in establishing and maintaining adequate measures for the prevention and control of cancer.

MEDICAL SERVICE FOR LOW INCOME GROUPS

Title II of the bill would add a new title to the Public Health Service Act, title VII, to assist the states to provide general health, hospital and medical services for families and individuals with low incomes. The new title VII is in two parts, part A—Medical Care Survey, a provision not included in the earlier bill, and part B—Medical Care Services.

Medical Care Survey.—The apparent purpose of part A is to authorize an appropriation of $3,000,000 to assist states in making a statewide inventory of existing medical, hospital and surgical care preparatory to the formulation of a plan for extending such care as contemplated by part B. Before a state may receive financial aid under part A, an application must be filed with and approved by the director of the Office of Medical and Hospital Care Services. This application must (1) designate a single state agency as the sole agency for making the survey, (2) provide for the designation of a state advisory council to include representatives of nongovernmental organizations or groups, and of state agencies concerned with the provision of medical or hospital care services, including representatives of the users of such services, selected from among persons familiar with the need for such services in urban or rural areas, to consult with the state agency in carrying out the survey, (3) provide for making an inventory and survey and for developing a program in accordance with part B, and (4) provide that the state agency will make such reports as the director may from time to time reasonably require.

Allotments for Surveys and Planning.—On approval of an application, a state will be entitled to receive an allotment of such proportion of any appropriation made available for surveys and planning as its population bears to the population of all the states. Within such allotment, it will be entitled to receive 33⅓ per cent of its expenditures incurred in making the survey and in the preparation of a plan. No allotment to any state will be less than $10,000.

Medical Care Services.—Part B will authorize an appropriation of $200,000,000 for each of five fiscal years to assist the states in providing general health, hospital and medical services for families and individuals with low income. During and after this five year period the Congress will review the program and determine the amount to be authorized thereafter.

State Plans.—Any state desiring to participate in this program may submit a plan to the director which must:

1. Designate a single state agency as the sole agency for the administration of the plan or designate such agency as the sole agency for supervising the administration of the plan, "providing that on or before 1949 such agency shall be the state health agency."

2. Provide for the designation by the governor of a state medical and hospital care advisory council, to include representatives of nongovernment organizations or groups, and of state agencies concerned with the administration or utilization of health, medical or hospital services, including representatives of state medical associations, state hospital associations, voluntary nonprofit prepaid hospital plans and voluntary nonprofit prepaid medical care plans, or other groups interested in

the improvement of medical and hospital services and in the better distribution thereof.

3. Contain satisfactory evidence that the state agency will have authority to carry out the plan.

4. Set forth a statewide program designed and calculated to provide, within five years, (*a*) hospital services, surgical services and medical services for all those families and individuals in the state having insufficient income to pay the whole cost of such, and (*b*) periodic physical examination for all children in elementary and secondary schools in the state. Such a program may, (1) at the option of the state, provide medical care services in institutions, in the home or in physicians' offices; (2) provide for the furnishing of such services to such families and individuals by means of payments in the nature of premiums or partial premiums or reimbursement of expenses or otherwise by the state, to any voluntary health, medical or hospital insurance fund, or other fund, operated not for profit, in behalf of those families and individuals unable to pay the whole cost of such services or insurance therefor; (3) include and take account of services rendered or to be rendered by governmental subdivisions of the state and by private organizations operating not for profit and may provide for the payment to such institutions by the state or subdivision for care to such families and individuals, and (4) include payments to physicians practicing in areas which, without such payments, would be unable to provide sufficient income to attract a practicing physician. The program must provide for the collection of proper charges of less than the total cost of such services from persons unable to pay in whole but able to pay in part therefor.

5. Describe the financial contribution for the support of the plan to be made by the state, its local subdivisions, and its private institutions, "which contributions shall be sufficient to carry out the program . . . at the end of said period of five years." The financial contribution made by the state and its governmental subdivisions must be at least equal to the amount contributed for similar purposes in the year 1946 and at least equal to the federal aid made available to the state under this legislation. There has been added to the pending bill a new provision to the effect that nothing in it shall "modify obligations assumed by the federal government under other statutes for the medical and hospital care of veterans." This would seem to mean that if a veteran is entitled to medical and hospital services at government expense and if such services are supplied through a state program, then the federal government will pay the full cost and not merely the percentage it normally would pay for services rendered under a state plan.

6. Set forth the relative need of the various proposals required to carry out the plan and provide for the proper priority between such proposals, based on such need, as financial resources become available.

7. Be based on a statewide inventory of existing medical, surgical and hospital care, including that provided by the state and by private organization and shall describe in detail the extension of such services to the end that they be furnished without discrimination on account of race, creed or color to all persons unable to pay in full therefor.

8. Provide that the state agency will make such reports as the director may from time to time reasonably require and afford to the director, on demand, access to the records on which the information is based.

9. Provide that the state agency will from time to time review its state plan and the operation thereof and submit to the director any modifications thereof which it considers necessary.

Approval of State Plans.—If a state plan fulfils the conditions specified in the preceding paragraphs, it must be approved by the director. If a plan is disapproved for failure to comply with the conditions named, the National Medical Care Council (erroneously referred to in the pending bill as the National Health Council) must, on the request of the state agency, afford it an opportunity for hearing.

No plan may be disapproved because the director disagrees with the methods proposed, if the program is designed and calculated by July 1, 1952 to provide hospital services, surgical services, medical services and periodic physical examinations at a cost within the probable financial resources of the state with federal aid. It is expressly provided that the state shall devise in each case *methods* by which this end is to be attained.

Allotments to States.—Each state with an approved plan will be entitled to an allotment for each fiscal year of a sum bearing the same ratio to total federal appropriation as the product of (*a*) the population of such state and (*b*) its percentage of tax-paying ability bears to the sum of the corresponding products for all the states having plans approved. The percentage of tax-paying ability of a state will be that percentage which bears the same ratio to 50 per cent as the per capita income of the continental United States (excluding Alaska) bears to the per capita income of such state, except that such percentage shall in no case be more than 66⅔ per cent or less than 25 per cent. Sums allotted to a state for a fiscal year and remaining unencumbered at the end of the year will remain available to the state for the next fiscal year.

Withholding of Allotments.—Allotments to a state may be discontinued with the approval of the administrator if the director, after reasonable notice and opportunity for hearing to the state agency, finds (1) that the state agency is not complying substantially with the provisions of the plan theretofore approved by the director or (2) that any federal funds have been diverted or (3) that the state and its governmental subdivisions have failed to provide toward the carrying out of the plan at least as much money as received from the federal government. A dissatisfied state whose allotments have been discontinued may appeal to the United States circuit court of appeals for the circuit in which the state is located. The findings of fact by the director, unless substantially contrary to the weight of evidence, will be conclusive. The court may, however, for good cause remand the case to the director to take further evidence.

Regulations; National Medical Care Council.—The director will be authorized to make such administrative rulings as he finds necessary, and in administering the title he will be required to consult with a National Medical Care Council (designated as the National Health Council in the initial bill), consisting of the director ex officio, who shall serve as chairman, and eight members appointed by the administrator. Five of the eight appointed members will be persons who are outstanding in the fields pertaining to medical and hospital care, and at least four of them must be doctors of medicine. The other three appointive members must be persons familiar with the needs for medical and hospital care in urban and rural areas. The council will be authorized to appoint such special and technical committees as may be useful in carrying out its functions. The council will meet as frequently as the administrator deems necessary, but not less than once each quarter. On the request of three or more members, it will be the duty of the administrator to call a meeting of the council.

Miscellaneous.—If the director believes that the purposes of this title would be promoted by a conference of representatives of state agencies, he may call such a conference. On the application of five or more such state agencies, it will be his duty to call a conference of representatives of all state agencies joining in the request. A conference of representatives of all such state agencies must be called annually by the director.

Except as otherwise specifically provided, nothing in this title may be construed as conferring on any federal officer or employee the right to exercise any supervision or control over the administration, personnel, maintenance or operation of the health services with respect to which any funds have been or may be expended under this title.

DENTAL HEALTH SERVICES

Title II of the bill would add another title to the Public Health Service Act, title VIII, proposing federal funds to assist the states to provide dental examination for school children and necessary dental care for those school children and other individuals and families unable to pay the whole cost of such care. As with the case of the title relating to medical services, title VIII is divided into two parts, part A, authorizing an appropriation of $1,000,000 to assist the states in making dental surveys, and part B, relating to state programs for extending dental care services under which there will be authorized to be appropriated for the fiscal year ending June 30, 1948 the sum of $8,000,000, for the fiscal year ending June 30, 1949 the sum of $12,000,000, for the fiscal year ending June 30, 1950 the sum of $16,000,000, and for each of the following fiscal years the sum of $20,000,000. Through what appears to be a drafting error, these dates in the pending bill are at variance with those just stated and must be corrected before action is taken on the bill.

For a state to take advantage of this title, it must submit plans to the director of Office of Dental Care Services for his approval. The requirements with respect to such plans parallel closely the requirements specified for plans for general medical services in that they must designate a single state administrative agency which "after 1949" must be the state health agency, provide for a dental health advisory council, describe the financial participation required from the state and its governmental subdivisions, and so on. One requirement is that a plan must set forth a statewide program designed and calculated within five years to provide for the periodic inspection of the teeth of all children in the elementary and secondary grades of public and nonpublic schools in the state and to provide for the dental care and treatment of dental diseases and dental defects, including prophylaxis, filling, x-ray, extraction and related care, other than straightening, of the teeth of those children in the elementary and secondary grades of public and nonpublic schools of the state, who, and whose family or guardian, have insufficient income to pay for the whole cost of the services. The program may at the option of the state provide dental care for those families and individuals in the state having income insufficient to pay the whole cost of such service.

DENTAL RESEARCH

The bill introduced in the Seventy-Ninth Congress contained provisions relating to research in the fields of general medical health, neuropsychiatry and dentistry. Title II of the pending bill would add another title to the Public Health Service Act, title IX, providing for dental research only. It would authorize an appropriation of a sum not to exceed $2,000,000 for the erection and equipment of an adequate building for the use of the proposed National Institute of Dental Research to be created as a division of the National Institute of Health. Additional appropriations would be authorized to further research in dental diseases and impairments and to establish scholarships in the field of dental health.

MISCELLANEOUS

Title III of the pending bill, after proposing certain technical amendments to existing laws, provides that on the direction of any officer or employee of the government of the United States, requesting the government to deduct from the salary of such employee a fixed sum or percentage to be paid to any voluntary health insurance fund, such sum or percentage shall be deducted from the salary and paid as directed by the employee or officer. The term "United States" is defined to mean all departments, bureaus, agencies and other divisions of the government and corporations the stock of which is wholly owned by the government. The term "health insurance fund" is defined to include any nonprofit organization undertaking to provide or to insure against the expense of hospital, medical, dental or other services connected with health.

This title also directs the Secretary of the Treasury, beginning with the fiscal year ending June 30, 1948, to deposit for each year in a special fund in the Treasury of the United States proceeds of taxes, duties, imposts or excises in an amount equal to the aggregate of the amounts authorized to be appropriated for such year under the bill. Amounts deposited in such fund will be available for expenditure only pursuant to appropriations made under authority of the legislation, and no moneys will be payable on any of said appropriations except from the fund. Any amounts remaining in the fund after the expiration of the period for which such amounts are available for expenditure will be covered into the general fund of the Treasury.

Official Notes

SECRETARY OF COUNCIL ON MEDICAL EDUCATION AND HOSPITALS APPOINTED

The Board of Trustees of the American Medical Association has appointed Dr. Donald G. Anderson of Boston as secretary of the Council on Medical Education and Hospitals, effective July 1, 1947. Dr. Anderson is dean of the Boston University School of Medicine. He is a graduate of Harvard College and received the M.D. degree from Columbia. He has had hospital and academic appointments at Boston City Hospital, Presbyterian Hospital in New York, Evans Memorial and Massachusetts Memorial Hospitals in Boston, and Columbia. During the war he was associated with Dr. Chester Keefer in penicillin research for the Office of Scientific Research and Development. His research publications deal primarily with the employment of the sulfonamide drugs, penicillin and streptomycin in the chemotherapy of infections.

Washington Letter

(From a Special Correspondent)

March 21, 1947.

Rest for President Truman on Advice of Physician

The President's brief vacation in Florida was taken on strict orders of his personal physician, Brig. Gen. Wallace H. Graham. General Graham said that Mr. Truman's health is "excellent and actually radiant. It's just that he's been going pretty hard lately and he needs a rest just like everybody else."

Proposal That Pentagon Be Used as a College for Veterans

Representative Lane, Massachusetts Democrat, has presented a bill to Congress advocating that the Pentagon Building be used as a university to train veterans for careers in peacetime. Mr. Lane pointed out that Governor Maurice J. Tobin of Massachusetts has authorized the use of an army camp as a state college for veterans. It has not been indicated whether medical subjects would be included.

Launching of Cancer Survey

The first complete cancer survey to be held in the District of Columbia has been launched and, when completed, a cancer program will be mapped out by the American Cancer Society. The U. S. Public Health Service will assist District of Columbia officials and the local cancer society. Dr. Harold Dorn, cancer statistician, National Cancer Institute, will direct the Washington survey.

Continuation of War on Rodents

Dr. George C. Ruhland, health officer for the District of Columbia, announced that the long continued effort to rid the nation's capital of rodent pests will be continued again this year. He told a delegation of complaining citizens that "there are not enough people in the employ of the District government to do all the work necessary to lessen the pest and rodent problems in Washington."

Veterans Administration Asks Condemnation of Hospital Site

Refusal by the owners of an $851,436 offer for the 25 acre Nevius tract in Arlington County, sought by the Veterans Administration as the site of a new $15,000,000 hospital, has prompted that agency to start condemnation proceedings. Work on the hospital will start in June, if the agency takes possession, and should be completed in eighteen months or two years.

Approval of Bill on Certification of Streptomycin

President Truman has signed a bill which requires federal inspection and certification of streptomycin.

Medical Legislation

STATE LEGISLATION

Arizona

Bill Passed.—H. 206 passed the house March 5. It proposes a law providing for the licensing, regulation and **inspection of hospitals** within the state.

Arkansas

Bill Passed.—S. 301 passed the senate March 3. It proposes that **any person desiring to be married** shall file a medical certificate from a duly licensed physician showing that the applicant has been given a physical examination and is not infected with syphilis in a stage of that disease which is or may become communicable to the marital partner.

California

Bill Introduced.—A. 2428, to amend the business and professions code, proposes, under certain circumstances, to authorize **licentiates of other states** to act as resident or assistant resident physician and surgeon in state hospitals for a period of not exceeding one year.

Colorado

Bill Introduced.—S. 453, to amend the law relating to the **practice of chiropody**, proposes to define the practice of chiropody as "the diagnosis and medical, surgical, mechanical, manipulative and electrical treatment of ailments of the human toe, foot and leg, excepting any amputation and excepting the administration of an anesthetic other than local." The proposal also defines the terms "toe, foot and leg," "amputation," "diagnosis," "medical treatment," "surgical treatment," "mechanical treatment," "manipulative treatment" and "electrical treatment."

Kansas

Bill Introduced.—H. 327 proposes the creation of a **naturopathic examining board** and defines naturopathy as "the prevention, diagnosis and treatment of human injuries, ailments and diseases by means of any one or more of the psychological, physical or mechanical, chemical or material forces or agencies of nature."

Maryland

Bill Passed.—H. 247 passed the house March 6. It proposes to prohibit certain types of **advertising by osteopaths**, chiropractors, physiotherapists and naturopaths.

New Hampshire

Bill Introduced.—H. 371 proposes the enactment of a hospital licensing law.

Bill Enacted.—H. 154 was approved March 4. It amends the law relating to **medical service corporations** by authorizing the agents of such corporations to be nonresidents of the state.

North Dakota

Bill Passed.—H. 52 passed the senate March 8. It proposes to amend the law relating to hospitals by setting up rules and regulations for the licensing of **maternity homes** and maternity hospitals.

Oregon

Bill Passed.—H. 7 passed the senate March 5. It proposes to require all physicians licensed by the state board of medical examiners to **report immediately to the local health officer** the name, sex, date of birth and address of every person diagnosed as a case of epilepsy or similar disorder characterized by momentary or prolonged lapses of consciousness or control, which is or may become chronic.

Pennsylvania

Bill Introduced.—H. 493 proposes the creation of a state **board of massage examiners** and defines massage as the art of body massage either by the hand or by mechanical apparatus, oil rubs, hot and cold packs, cabinet baths (excluding fever therapy), tub, shower, sitz and similar baths.

Texas

Bill Introduced.—H. 503 proposes the enactment of a state **hospital survey and construction act** requiring a statewide survey of hospital facilities and the preparation of a program for the construction of additional needed facilities. The proposal also requires the appointment of an advisory hospital council and the establishment of regulations for the purpose of obtaining federal funds to assist in survey and construction programs.

Vermont

Bill Passed.—H. 164 passed the house March 5. It proposes an appropriation for the continued maintenance of the Vermont **blood plasma bank.**

Washington

Bill Passed.—H. 378 passed the house March 3 and the senate March 8. It proposes to require applicants for a **license to practice medicine** and surgery to have graduated from a medical school accredited and approved by the Association of American *Medical Colleges* and the Council on Medical Education and Hospitals of the American Medical Association.

West Virginia

Bill Enacted.—S. 71 was approved March 5, 1947. It amends the law relating to medical and hospital service corporations by authorizing such corporations to **promote and encourage reciprocity** with similar plans both within and without the state.

Coming Medical Meetings

Alabama, Medical Association of the State of, Birmingham, April 14-16. Dr. Douglas L. Cannon, 519 Dexter Ave., Montgomery 4, Secretary.

American Association for the Study of Goiter, Atlanta, Ga., April 3-5. Dr. Thomas C. Davison, 478 Peachtree St., N. E., Atlanta 3, Secretary.

American Association of Anatomists, Montreal, Canada, April 3-5. Dr. Normand L. Hoerr, 2109 Adelbert Road, Cleveland 6, Secretary.

American Association of Industrial Physicians and Surgeons, Buffalo, N. Y., Statler Hotel, April 26-May 4. Dr. Frederick W. Slobe, 28 E. Jackson Blvd., Chicago 4, Secretary.

American College of Physicians, Chicago, April 28-May 2. Mr. E. R. Loveland, 4200 Pine St., Philadelphia 4, Secretary.

American Laryngological Association, St. Louis, April 23-24. Dr. Arthur W. Proetz, 12 Westmoreland Place, St. Louis 8, Secretary.

American Laryngological, Rhinological and Otological Society, St. Louis, April 25-26. Dr. C. Stewart Nash, 288 Alexander St., Rochester 7, N. Y., Secretary.

American Otological Society, St. Louis, April 21-22. Dr. Gordon D. Hoople, 713 E. Genesee St., Syracuse 2, N. Y., Secretary.

American Society for Clinical Investigation, Atlantic City, Chalfonte-Haddon Hall, May 5. Dr. Eugene A. Stead Jr., Grady Hospital, Atlanta 3, Georgia, Secretary.

American Society for Research in Psychosomatic Problems, Atlantic City, May 3-4. Dr. Edwin G. Zabriskie, 714 Madison Ave., New York 21, Secretary.

Arizona State Medical Association, Tucson, May 7-10. Dr. Frank J. Milloy, 112 N. Central Ave., Phoenix, Secretary.

Arkansas Medical Society, Little Rock, April 17-19. Dr. William R. Brooksher, 602 Garrison Ave., Fort Smith, Secretary.

Association of American Physicians, Atlantic City, May 6-7. Dr. Joseph T. Wearn, Lakeside Hospital, Cleveland 6, Secretary.

California Medical Association, Los Angeles, Hotel Biltmore, April 30-May 3. Dr. L. Henry Garland, 450 Sutter St., San Francisco 8, Secretary.

Connecticut State Medical Society, New Haven, April 28-30. Dr. Creighton Barker, 258 Church St., New Haven 10, Secretary.

Florida Medical Association, Miami, April 20-23. Dr. Robert B. McIver, P. O. Box 1018, Jacksonville, Secretary.

Georgia, Medical Association of, Augusta, Bon Air Hotel, April 22-25. Dr. Edgar D. Shanks, 478 Peachtree St. N. E., Atlanta, Secretary.

Hawaii Territorial Medical Association, Lihue, Kauai, May 1-4. Dr. Harry L. Arnold Jr., 510 S. Beretania St., Honolulu 53, Secretary.

Iowa State Medical Society, Des Moines, April 16-18. Dr. John C. Parsons, 406 Sixth Ave., Des Moines 9, Secretary.

Maryland, Medical and Chirurgical Faculty of, Baltimore, April 22-23. Dr. W. Houston Toulson, 1211 Cathedral St., Baltimore 29, Secretary.

Mississippi State Medical Association, Biloxi, May 6-8. Dr. T. M. Dye, Box 295, Clarksdale, Secretary.

Missouri State Medical Association, Kansas City, March 30-April 2. Mr. Thomas R. O'Brien, 634 N. Grand Blvd., St. Louis 3, Executive Secretary.

Nebraska State Medical Association, Omaha, April 28-May 1. Dr. R. B. Adams, 416 Federal Securities Bldg., Lincoln 8, Secretary.

New Jersey, Medical Society of, Atlantic City, Haddon Hall, April 22-24. Dr. Alfred Stahl, 160 Lincoln Ave., Newark 4, Secretary.

New Mexico Medical Society, Albuquerque, April 30-May 3. Dr. H. L. January, 221 West Central Ave., Albuquerque, Secretary.

New York, Medical Society of the State of, Buffalo, May 5-9. Dr. Walter P. Anderton, 292 Madison Avenue, New York 19, Secretary.

North Carolina, Medical Society of the State of, Virginia Beach, Va., Cavalier Hotel, May 12-14. Dr. Roscoe D. McMillan, P. O. Box 232, Red Springs, Secretary.

Northern Tri-State Medical Association, Detroit, April 8. Dr. John L. Stifel, 232 Michigan St., Toledo 2, Ohio, Secretary.

Ohio State Medical Association, Cleveland, May 6-8. Mr. Charles S. Nelson, 79 E. State St., Columbus 15, Executive Secretary.

Oklahoma State Medical Association, Tulsa, Mayo Hotel, May 14-16. Mr. R. H. Graham, 210 Plaza Court Bldg., Oklahoma City, Executive Secretary.

Southwest Allergy Forum, Shreveport, La., March 31-April 1. Dr. Sim Hulsey, 505 Medical Arts Bldg., Fort Worth, Texas, Secretary.

Tennessee State Medical Association, Memphis, April 8-10. Dr. W. M. Hardy, 706 Church St., Nashville 3, Secretary.

Texas, State Medical Association of, Dallas, Adolphus Hotel, May 5-8. Dr. Holman Taylor, 1404 W. El Paso St., Fort Worth 3, Secretary.

GOVERNMENT SERVICES

ARMY

BENEFITS TO MEDICAL DEPARTMENT OF PROPOSED LEGISLATION

The benefits to the Medical Department of the proposed legislation before Congress (H. R. 2536) on procurement, promotion and elimination of Regular Army officers are outlined in the following statement issued by the Surgeon General's Office:

The bill provides that section 10 of the National Defense Act be amended to read "The Medical Department shall consist of Surgeon General with the rank of major general, four assistants with the rank of brigadier general, one of whom shall be an officers of the Dental Corps" is amended to read "The Medical Department shall consist of one Surgeon General with the rank of major general, one assistant with the rank of major general who shall be an officer assigned to the Dental Corps, and three assistants with the rank of major general or brigadier general as determined by the Secretary of War."

The bill authorizes a strength of active permanent general officers of the Regular Army in the Medical Corps equal to ¾ of 1 per cent of the authorized active commissioned strength of the Medical Corps of the Regular Army. Of a total authorized strength of active general officers there is authorized 50 per cent in the grade of major general and 50 per cent in the grade of brigadier general.

It provides for promotion lists in the Medical Department as follows: The Medical Corps Promotion List, the Dental Corps Promotion List, the Veterinary Corps Promotion List and the Medical Service Corps Promotion List. Of the total authorized promotion list strength for the entire army there is authorized 8 per cent in the grade of colonel, 14 per cent in the grade of lieutenant colonel, 19 per cent in the grade of major, 23 per cent in the grade of captain, 18 per cent in the grade of first lieutenant and 18 per cent in the grade of second lieutenant. The authorized number in each of the several grades in each of the several promotion lists is to be prescribed by the Secretary of War by a schedule of percentages in grades for that list, which schedule of percentages may be different for each promotion list. However, a saving clause provides that, irrespective of any vacancy in any grade, except general officers and colonels, whenever an officer whose name is carried on any recommended list under provision of this section completes for promotion purposes the prescribed number of years in the grade of first lieutenant, captain and major, the authorized number of officers in the grade of captain, major and lieutenant colonel respectively in the applicable promotion list shall be temporarily increased, if necessary, to authorize the appointment in that grade of such officer and all officers of his grade and promotion list whose names appear above his on the recommended list, and such officers shall be simultaneously appointed in that grade retaining among themselves their existing relative seniority. Until Dec. 31, 1947 initial appointments and promotions shall continue to be made in accordance with the present provisions of the integration and other laws but effective Dec. 31, 1947 no further appointments shall be made except under the provisions of this bill. The bill provides for promotion by selection to all grades to fill existing vacancies. However, irrespective of the existence of any vacancies promotion list officers of the line of the Army may be selected for promotion to the grade of first lieutenant, captain, major and lieutenant colonel on the completion of three years' service, seven years' service, fourteen years' service and twenty-one years' service. However, for the Medical Department each person appointed as an officer of the Regular Army shall at the time of appointment be credited with the amount of service equal to four years for the Medical Corps, three years for the Dental Corps and two years for the Veterinary Corps, which means that an officer in the Medical Corps appointed as a first lieutenant will be promoted to the grade of captain on the completion of three years' service, to the grade of major on the completion of ten years' service and to the grade of lieutenant colonel on the completion of seventeen years' service and is eligible for selection to the grade of colonel on the completion of eighteen years' service if vacancies do not occur in the respective grade at an earlier date. Therefore, effective Dec. 31, 1947 each officer of the Medical Corps who on that date has less than four years' service credit, each officer of the Dental Corps who has less than three years' service and each officer of the Veterinary Corps who has less than two years's service shall be credited for promotion purposes with four years', three years' and two years' service respectively.

Since the integration laws known as Public Laws 281 and 670, 79th Congress, permitted credit for appointment purposes to officers of the Medical Department equal to the difference between their age at the time of appointment and the age of 25 years an inequity was created for officers of the Medical Department of the Regular Army whose average age at the time of original appointment was $28\frac{5}{12}$ years. In order to overcome this inequity and place all officers of the Medical Department on equal footing so far as age in grade is concerned, the bill provides for the granting of credit to officers of the Medical Department commissioned between June 27, 1926 and Dec. 28, 1945 and who had continuous active commissioned service in the Regular Army since such appointment. Effective Dec. 28, 1945 such officers are credited respectively with additional years of service as follows: Medical Corps $3\frac{5}{12}$ years, Dental Corps $3\frac{1}{12}$ years and Veterinary Corps $1\frac{4}{12}$ years. The service credited shall be counted for promotion and permanent seniority purposes only. No change, however, will occur in the relative permanent seniority standing of any officer who held a commission in any of these corps on Dec. 28, 1945.

The bill provides that on July 1, 1948 or at the earliest practicable date thereafter Regular Army officers shall be promoted and appointed in the grades of first lieutenant, captain, major and lieutenant colonel to fill initial requirements which exist in those respective grades. In the case of all Medical Department Promotion Lists, owing to the present reduced strength of the various corps there now exists a number of vacancies, which means that officers at present in the various corps of the Medical Department, those being integrated and the ones to come into the service after Dec. 31, 1947 may look forward to more rapid promotion than has ever heretofore existed in the Medical Department of the Army.

In addition to promotion to permanent grades in the Regular Army, the bill provides for promotion to temporary rank whenever the number of permanent appointments in the grades of colonel, lieutenant colonel, major, captain and first lieutenant respectively is less than the number authorized in these grades in such promotion list.

The bill provides that from time to time officers of the reserve components of the United States Army may with their own consent be ordered to active federal duty for such length of time as the President may prescribe and that when the total number of officers serving on active duty, Regular Army, and all officers of the Army of the United States of any component exceeds the authorized active commissioned strength of the Regular Army the Secretary of War shall determine the requirements in each of the several grades, and temporary promotions are authorized for officers of these components to fill these requirements.

It is anticipated that there will exist in the Medical Department of the Regular Army 1,900 vacancies in the Medical Corps, 370 vacancies in the Dental Corps, 10 vacancies in the Veterinary Corps and 440 vacancies in the Medical Service Corps.

Even though all these vacancies in the Medical Department of the Regular Army could be filled there will still be needed several thousand reserve component officers on active duty to meet the requirements in each and every corps of the Medical Department to fulfil the needs of the anticipated strength of the interim army.

EMPLOYMENT OF A. S. T. P. GRADUATES BY THE ARMY

Approximately 12,000 medical officers received at least part of their training under the Army Specialized Training Reserve Program. Of this number 4,000 have served with the Army and have been separated, 5,000 remain on active duty and 3,000 are currently completing their internships. All the latter may expect to serve for two years, whether or not some of them are deferred for additional hospital training.

During the war the 9-9-9 house officership program provided the Army with a certain proportion of men having some advanced training. All 9,000 physicians who have served or are now serving received a nine months internship, 3,000 had eighteen months of hospital work and 1,500 were deferred for a total of twenty-seven months of house officer training. In general, officers with this additional training were assigned to duties carrying greater professional responsibilities.

The drastic reduction in army strength (from 8,300,000 to 1,300,000) and in patient load (from 365,000 to 55,000) permitted a decrease in medical officers from 48,000 to 6,400, of which 5,000 are A. S. T. P. graduates. Man for man replacements or rotation of the present medical officers cannot be effected by employing entirely physicians who have had only nine months of internship. Replacement needs are such as to require some men with longer training than nine months of internship. The task of caring for the Army's 55,000 patients is such that men with nine months of internship cannot automatically replace an equal number of men now in service.

Therefore, plans were made which were aimed to provide the Army with a number of men having more than the minimum of intern training by July of 1948 by the deferment program announced in December (THE JOURNAL, Dec. 21, 1946, p. 1017). The entire 3,000 A. S. T. P. interns were allowed to continue their hospital services until July 1, 1947. This adjustment had nothing to do with army needs; it was made to integrate internships with the decelerated medical school curriculum.

Further deferment for additional training was projected for half of these interns, as was done throughout the war under the 9-9-9 program. Interns numbering 1,200 were to be permitted an additional six months of training (to Jan. 1, 1948) and 300 an additional twelve months (to July 1, 1948). The latter group of 300, taking their additional training in medical school hospitals, was especially needed as replacements for D specialists.

Although the deadline for making these deferments was March 1, 1947, there were only 650 applications for deferment by this date. Of these, 350 have been deferred six months and 300 for one year.

The program was attempted to provide the Army with the medical officers it needs for assignments requiring previous hospital training of different durations. All the 3,000 A. S. T. P. men now in internships may anticipate two years of army service, including terminal leave, whether or not they are deferred.

INSECTS SURVIVE FLIGHT INTO THE IONOSPHERE

Living organisms have survived the penetration of the ionosphere in the war head of a captured German V-2 rocket fired from White Sands, N. M., the War Department has announced. Fruit flies, included in containers which held instruments and cameras installed by the Army Air Forces, have been recovered alive and seemingly none the worse for the experience.

The effect on the insects of the flight at supersonic speeds, along with the exposure to the heat and cosmic radiations of upper air regions, were part of experiments conducted by AAF technicians and civilian scientists.

The flies were placed aboard the rocket by researchers from the University of New Mexico. The last V-2 reached an altitude of more than 360,000 feet, the highest altitude attained by a living thing from the earth's surface.

The descent of the container took about an hour from the time it was ejected from the rocket at the apex of the missile's flight.

ARMY AWARDS AND COMMENDATIONS

Colonel Paul H. Streit

The Legion of Merit and later the Oak Leaf Cluster were recently awarded to Col. Paul H. Streit, now at Brooke General Hospital, Fort Sam Houston, Texas. The citations read in part as follows: For exceptionally meritorious conduct in the performance of outstanding service from June 21, 1942 to May 1, 1945. As commanding officer of a general hospital, Colonel Streit greatly increased its capacity, while his adoption of occupational therapy on a large scale aided materially in the rapid recovery and reconditioning of casualties. Later, as surgeon, Central Pacific Base Command, he reorganized the medical service in the Hawaiian area, planned and executed the medical logistical support for combat operations and superintended the hospitalization of battle casualties of the Pacific Ocean areas. By his devotion to duty, executive ability and superior medical and military attainments he made material contributions to the successes of our armed forces in the war against Japan. As commanding officer, Dibble General Hospital, Menlo Park, Calif., from June 1945 to February 1946 he initiated and supervised a comprehensive program of training and care for the blind and in cooperation with the Corps of Engineers designed and constructed clinics and wards for the treatment of blinded patients. Colonel Streit's work in this field did much to lighten the burden of the patients and was a valuable contribution to the medical service. Dr. Streit graduated from the University of Texas in 1916 and entered the military service in 1917.

Colonel John E. Gordon

The Legion of Merit and the U. S. Typhus Commission Medal were recently awarded to Col. John E. Gordon, M. C., A. U. S., Boston. The citations were, in part, as follows: 1. As chief of the preventive medicine division, Office of the Surgeon, Headquarters, European Theater of Operations, his vigilant surveillance of all possible dangers from contagious and communicable diseases has been largely responsible for the singularly high standard of health in this theater. His effective supervision of all phases of preventive medicine facilitated the general efficiency of the Medical Department in its support of the personnel of the United States Army. 2. He rendered exceptionally meritorious service in the control of epidemic typhus in the American occupied region of Germany during the period from May 19 to July 7, 1945. His intelligent supervision of modern control methods checked the spread of typhus in the inner reich, protected the advancing American forces and prevented the dissemination of typhus with the return of repatriates into France. Dr. Gordon graduated from Rush Medical College of the University of Chicago in 1925 and entered the military service June 14, 1942.

Captain Harry Most

The Legion of Merit has been awarded to Capt. Harry Most, M. C., A. U. S., of New York, who rendered exceptionally meritorious service while serving as chief of malaria research, Kennedy General Hospital, and chief of tropical disease section, Moore General Hospital, from January 1944 to January 1946. The citation relates that his unusual knowledge of tropical diseases made his work a primary factor in the successful operation of the Tropical Disease Center. Captain Most's accomplishments in this field materially benefited the medical profession and were of extreme value to the Medical Department in this phase of its mission. Dr. Most graduated from New York University College of Medicine in 1931 and entered military service in January 1944.

Major Emil E. Merkel

The Bronze Star Medal has been awarded to Major Emil E. Merkel, M. C., A. U. S., of Los Angeles, because of the meritorious service he performed on May 2, 1942 on Corregidor, Philippine Islands. The details are given in the citation: When a mortar battery received a hit during a heavy hostile artillery concentration he ran to the position and, as the enemy barrage continued, administered first aid to the wounded men. Major Merkel's action, done without regard for his own safety, reflects great credit on himself and on the military service. Dr. Merkel graduated from the College of Medical Evangelists in 1940 and entered the military service Dec. 15, 1940.

Medical News

(Physicians will confer a favor by sending for this department items of news of more or less general interest: such as relate to society activities, new hospitals, education and public health.)

CALIFORNIA

Chiropractor Held in Fraud.—According to the San Francisco *Examiner* an asserted racket was exposed in January in an eleven count federal mail fraud indictment against chiropractor John A. Zanetti, 49. Zanetti is operator of the National Clinical Institute, 224 Rosenberg Building, Santa Rosa. Advertising a sure cure for arthritis, he solicited victims to send $1 for information as to how they could be cured, the indictment charged. Once the first application for information had been made, Zanetti mailed the prospect literature claiming to have discovered a "miraculous new cure" for arthritis, James T. Davis, assistant U. S. attorney, said. The cure could be obtained for $250. If the money was not forthcoming within a few days, follow-up letters with special reductions were sent. When the second payment had been received, Davis declared, Zanetti mailed printed instructions in which he described arthritis as a "nervous disorder" and set up a course of action which he said would result in a cure. Davis said the local postoffice inspector's office was swamped with complaints of those who had been mulcted.

Stanford University Establishes Eye Bank.—Officials of Stanford University announced March 7 the establishment of an eye bank, a community service organization dedicated to providing corneal material for eye graft operations. Located at Stanford University Hospital, San Francisco, the organization will bring to blind and partially blind West Coast residents the same opportunity for sight improvement available to Easterners through eye banks now operating in New York, Boston and Chicago. The principal function of the local eye bank is the collection, preservation and distribution of eyes to obtain corneal tissue. All qualified eye surgeons on the Pacific Coast will be invited to make use of the bank's facilities. The corneas collected and preserved by the eye bank are to be distributed without cost to either patient or surgeon, except for a small service fee to cover the cost of handling. Plans for expeditious transportation of the corneal tissue were made March 6 at a luncheon at which the Air Express, United Airlines, Railway Express and Greyhound Bus Lines promised full cooperation. The university was represented by Dean Chandler, Dr. Anthony J. J. Rourke, Stanford Hospital physician-superintendent, Drs. Max Fine and Dohrmann K. Pischel, eye surgeons, and Mrs. John W. Hartman, eye bank secretary. With this announcement university officials issued a call for registration of donors wishing to donate their eyes to the bank after death. Information on the procedure for registration of donors can be secured by telephoning WEst 1-8000, where twenty-four hour service is available, or by writing to the Stanford Eye Bank, 2398 Sacramento Street, San Francisco. Other objectives of the eye bank will be to promote interest in research aimed at developing successful methods of preserving corneal tissue for longer periods than are now possible and to encourage investigation leading to improved methods of corneal transplantation.

ILLINOIS

Mild Influenza.—An outbreak of mild influenza reached epidemic proportions in Illinois March 6, according to Dr. Jerome J. Sievers, head of the division of communicable disease of the state department of health. He added that the outbreak had started in the southern section of the state and spread rapidly.

Evanston Hospital to Expand.—The erection of an addition to Evanston Hospital, Evanston, estimated to cost $1,250,000 will begin in June as the first step in a $5,000,000 expansion program. Succeeding steps will be to replace with fireproof structures the maternity building, the children's building and the administration building; to add buildings for the care of tuberculosis, arthritis, poliomyelitis, eye, ear, nose and throat, psychiatric and psychosomatic, chronic and old age diseases and contagious diseases, and to provide additional general beds with equipment to handle the steadily increasing population of the north suburban area.

New Director of LaSalle County Sanatorium.—Dr. H. Vernon Madsen, Waterloo, Iowa, has assumed duties as medical director and executive of the LaSalle County Tuberculosis Sanatorium, Ottawa, replacing Dr. Loren L. Collins, who resigned September 1 to become medical director for a sanatorium in Madison County, Ill. Dr. Madsen, a graduate of the University of Iowa College of Medicine, has served on the staffs of state sanatoriums in Iowa, North Dakota and Indiana and was medical director of the Smith-Estab Memorial Hospital, Richmond, Ind. Before taking the Ottawa position he was engaged in private practice in chest diseases in Waterloo.

Chicago

The Wilder and Kretschmer Lectures.—The William Hamlin Wilder Memorial Lecture will be delivered May 23 at the Palmer House by Dr. John Q. Griffith Jr., Laboratory for the Study of Hypertension, Philadelphia, on "Rutin: A Therapy for the Hemorrhagic Complications of Hypertension." The sixth Edwin R. Kretschmer Memorial Lecture will be delivered April 25 at the Palmer House by Dr. Charles H. Watkins, Mayo Clinic, Rochester, Minn., on "Evaluation of Recent Drugs in the Control of Experimental and Human Leukemia."

Drive to Clean Up Restaurants.—On February 12 the president of the board of health, Dr. Herman N. Bundesen, began a drive to "close up every dirty eating and drinking place in Chicago" (The Journal, January 25, p. 255). Some twenty-eight additional food inspectors have been added to the staff; most of the restaurant owners are cooperating with the health department, and an ordinance which would conform closely to the model law proposed by the U. S. Public Health Service is being drafted. Some restaurants were temporarily closed by the city health department, including two in railroad stations, which were allowed to reopen after the insanitary conditions had been corrected. Seven additional restaurants were closed on March 13, including the one at the St. Claire Hotel, 162 East Ohio Street. The health department inspectors in reporting on the St. Claire had said that the kitchen floor, work benches and ice box were dirty, decaying food was on the counters, the meat slicers were dirty and the dish washer lacked required chlorine. Food in the refrigerators had water dripping on it from the ice compartment, and milk was standing unrefrigerated. When hotel officials had previously refused to obey a health department order to close until violations were corrected, Dr. Bundesen went to the hotel, personally closed it and had police assigned to the hotel to see that his order was obeyed. The other restaurants closed on the same date were Annes', 91 West Randolph Street, the Coney Island Lunchroom, 556 East Forty-Seventh Street and restaurants at 551 South State Street, 75 West Van Buren Street, 245 East Thirty-Ninth Street and 4424 Broadway. Rickett's Restaurant at 105 East Chicago Avenue and the Fish and Chips, 72 East Randolph Street, were permitted to remain open because they had corrected previous violations, which were not of a major character. All these restaurants with the one exception closed of their own volition and will be permitted to reopen, as will the St. Claire's restaurant, when conditions are remedied. Twenty-six other eating places previously temporarily closed were found to have complied with rules and were allowed to reopen. Dr. Bundesen said that "fully 80 per cent of the restaurants and hotels have done a fine job. We will be forced to close the kitchens of those which do not comply." He stated that the spread of upper respiratory diseases may be aided by dirty dishes, insanitary handling, dirty lukewarm dishwater and insanitary conditions in the kitchens.

INDIANA

Brucellosis Survey.—The Indiana State Board of Health and Purdue University, with the cooperation of the U. S. Bureau of Animal Industry and the U. S. Public Health Service, is making a study of brucellosis in Indiana to determine the extent, location and distribution of undulant fever. In selected representative areas the size of townships, all farm people are given blood tests. At the same time samples are taken from all dairy cattle, horses and goats and of the breeding swine, cattle and sheep. Other groups of highly exposed individuals, workers in rendering and packing plants, are also being surveyed. The Bureau of Animal Industry has supplied personnel and a trailer laboratory to test animals. Blood tests are done by the state board of health laboratory in Indianapolis, and at Purdue effort is being made to isolate the organism. Cooperation of the people is gratifying. When half of Daviess County had been surveyed, about 1 per cent of both animals and human beings reacted to the test. Blood samples taken by county health officers, private physicians and state board of health personnel showed that 28 per cent of rendering plant workers showed various degrees of reactivity at the halfway point in the survey. In the one packing plant surveyed, 13.5 per cent of those tested gave a reaction. Laboratories in Indianapolis and Purdue have made 18 isolations from human blood; 61 per cent were of the abortus type, 22 per cent the suis type and 17 per cent the melitensis, or goat, type.

IOWA

State Medical Meeting at Des Moines.—The Iowa State Medical Society will hold its ninety-sixth annual session at Des Moines April 16-18 at the Hotel Fort Des Moines under the presidency of Dr. Robert L. Parker, Des Moines. Among the speakers at the Wednesday afternoon pediatric and obstetric symposium are:

Dr. Alexis F. Hartmann, St. Louis, Principles Governing the Choice and Parenteral Administration of Fluids.
Dr. Ralph A. Reis, Chicago, Diabetes in Pregnancy.
Dr. Ralph Luikart, Omaha, Obstetrics—Yesterday and Today.
Dr. John R. Schenken, Omaha, The Rh Factor.

Other speakers included in the general and special sessions on succeeding days are:

Dr. Charles W. Mayo, Rochester, Minn., Some Provocative Cases.
Dr. H. Harlan Crank, Topeka, Kan., Psychosomatic Medicine: General Considerations.
Dr. Arthur M. Culler, Columbus, Ohio, Hemorrhage in the Fundus.
Dr. Grandison D. Royston, St. Louis, Uterine Bleeding.
Dr. Joseph B. Vander Veer, Philadelphia, Principles of Digitalis Therapy and Comments on Various Preparations and Methods of Administration.
Dr. Isador S. Ravdin, Philadelphia, Some Problems of Biliary Tract Disease.
Dr. Robert L. Parker Jr., Rochester, Diagnosis of Congenital Cardiac Malformations for Which Surgery Is Indicated.

A symposium on poliomyelitis will be held Friday at 3 p. m. with Drs. Ralph K. Ghormley, Rochester; Gaylord W. Anderson, *Minneapolis; Lee F. Hill, Des Moines, and Earl C. Elkins,* Rochester, Minn., participating. The Medical and Surgical sections will meet Thursday and Friday afternoons, the Eye, Ear, Nose and Throat section all day Thursday, and the Pediatric section Thursday morning. The State Society of Iowa Medical Women and the American Medical Women's Association, Branch 19, will meet Wednesday, April 16. At the annual banquet April 17 Dr. George F. Lull, secretary and general manager of the American Medical Association, will be the speaker. Doctors with hobbies are invited to make arrangements for their exhibits by April 1 by writing the central office, 505 Bankers Trust Building, Des Moines.

MARYLAND

Social Medicine Lecture.—A public De Lamar lecture on "Teaching and Research in Social Medicine: An Account of the Oxford Experiment" was given March 4 by Sir John Ryle, Nuffield professor of social medicine, Oxford University, at Johns Hopkins University School of Hygiene and Public Health, Baltimore.

MICHIGAN

University Appointment.—M. Evans Maxfield, Ph.D., at present assistant professor of physiology at Mount Holyoke College, South Hadley, Mass., has been appointed to the staff of the department of pharmacology and therapeutics at Wayne University College of Medicine, Detroit.

Resigns to Enter Private Practice.—Dr. George A. Sherman, director of the state health department bureau of tuberculosis control since 1941, resigned to enter private practice March 1. Before joining the state health department staff he was director of the Oakland County Tuberculosis Sanatorium and an instructor at the University of Michigan.

MISSISSIPPI

Applications for Student Aid.—Applications for loans effective in September and October are being received by the State Medical Education Board, Jackson, for use of students interested in obtaining financial assistance under the medical education scholarship loan program recently set up (The Journal, February 1, p. 335). Mrs. Maria Voskamp, Jackson, is the executive secretary.

MISSOURI

Cancer Research.—Washington University, St. Louis, was one of twenty-one universities to receive grants for cancer research, it was announced by the National Advisory Council. The work will be supervised by Dr. Sherwood Moore, professor of radiology and head of the department, and a member of the advisory council; Arthur L. Hughes, D.Sc., consulting physicist to Mallinckrodt Institute of Radiology; Dr. Edward H. Reinhard, assistant professor of medicine and radiology, and Dr. Carl V. Moore, professor of medicine.

New Health Commissioner.—Dr. Cecil A. Z. Sharp, Joliet, Ill., health commissioner of Will County, Ill., has been appointed health commissioner of St. Louis County, Mo., effective April 1, replacing Dr. Ruth I. Allen, acting commissioner, who will return to her former duties as director of Maternal and Infant Hygiene. Dr. Sharp, a graduate of the University of Geneva, Switzerland, was in private practice before joining the staff of the Illinois Health Department. He received a degree of Master of Science in Public Health at the University of Michigan, 1938. In his new position he will also serve as assistant professor of public health and preventive medicine at the Washington University School of Medicine, St. Louis.

Annual State Medical Meeting.—The eighty-ninth annual session of the Missouri State Medical Association will be held March 30-April 2 at the municipal Auditorium and Hotel President in Kansas City under the presidency of Dr. Howard B. Goodrich, Hannibal. The council meeting March 30 at 4 p. m. will be followed by a dinner for secretaries and presidents of the county medical societies. The first general meeting Monday afternoon will be in part a discussion of the medical care of veterans. Among the speakers will be Dr. Robert M. Zollinger, Washington, D. C. Among the speakers at the general sessions will be Drs. Herman W. Johnson, Houston, Texas, "Uterine Ring Dystocia"; Arthur M. Olsen, Rochester, Minn., "Diagnosis and Treatment of Bronchial Lesions",; William A. Altemeier, Cincinnati, "Chemotherapy as Used in Surgical Conditions"; Donald R. Nichols, Rochester, Minn., "Chemotherapy as Used in Medical Conditions," and Garfield G. Duncan, Philadelphia, "Some Nutritional Pitfalls in General Hospitals."

There will be symposiums on poliomyelitis, chemotherapy, nutritional deficiencies and industrial health. Other features of *the sessions will be motion pictures and scientific exhibits, and* a banquet Monday night honoring past presidents. The Woman's Auxiliary will meet March 30-April 1 at the Hotel Muehlebach.

NEW JERSEY

Personal.—Dr. Abraham Z. Barhash, Newark, has been appointed director of the division of community clinics of the National Committee for Mental Hygiene, succeeding Dr. Milton E. Kirkpatrick, New Orleans. Dr. Barhash served in the army as a neuropsychiatrist.

Cancer Week.—The Passaic County Medical Society will have charge of the exhibits and motion pictures on the lay program for Cancer Week, April 1-5, at the Public Library, Paterson. Dr. Anthony J. Delario, Paterson, will give a talk at 7:30 p. m. on April 1; Dr. Jacob Roemer, Paterson, April 3; Dr. Andrew F. McBride Jr., Paterson, April 4, and Dr. John J. Szymanski, Passaic, April 5.

Lecture by Dr. Kennedy.—Dr. Foster Kennedy, professor of clinical medicine (neurology), Cornell University Medical College, New York City, addressed the reciprocity meeting of the Woman's Auxiliary to the Hudson County Medical Society, Jersey City, March 3, on "The Organic Background of Mind." Dr. Kennedy is also director of the neurologic department of Bellevue Hospital, New York City. He recently returned from the Pan American Medical Congress meeting in Cuba.

NEW YORK

Committee for Education on Alcoholism.—As a result of interest growing out of the work of Alcoholics Anonymous groups, a committee for education on alcoholism, consisting of physicians, members of the clergy, social workers, industrialists, law enforcement officers and others in Rochester, has been formed. The committee wishes to provide for medical care of chronic alcoholic addicts. Dr. G. Kirby Collier, Rochester, is honorary chairman of the committee.

Meeting of Diabetes Association.—The New York Diabetes Association, Inc., under the auspices of the committee on research, will hold an open meeting at 8:30 p. m., March 31, at the New York Academy of Medicine. "Recent Observations on Experimental Diabetes" by Dr. Francis D. W. Lukens, assistant professor of medicine and director of the George S. Cox Medical Research Institute, University of Pennsylvania, and "Insulin Requirement and Exercise" by Dr. Harold E. Himwich, chief, clinical research branch, medical division, Edgewood Arsenal in Maryland, make up the program. The discussion to follow will be opened by Dr. DeWitt Stetten Jr., department of biochemistry, Columbia University College of Physicians and Surgeons, New York.

New York City

Health Nursing Center Opened in Chinatown.—The Community Service Society opened a health nursing center at the Chinese Community Club, 24 Pell Street, February 27. The ultimate aim of the service work in Chinatown will be to add facilities for health examinations and to hold sessions in nutrition and the care of infants.

Sydenham Emergency Fund Raised.—The emergency fund to save Sydenham Hospital now totals $300,000 following a series of personal contributions and benefits. The hospital, when confronted with the possibility of closing last November, made an appeal for $300,000 on Thanksgiving Day. Sydenham in 1943 was reorganized as an interracial voluntary hospital.

Positions for Psychiatrists Open.—Positions are available for 13 psychiatrists at the newly opened psychiatry pavilion of Kings County Hospital, Brooklyn, the salaries ranging from $3,650 to $6,000 a year, the New York City Department of Hospitals announces. When staffing is completed this facility will be a self-contained hospital promoting every aspect of up to date psychiatric diagnosis and treatment (The Journal, March 1, p. 637). The building includes complete x-ray and surgical setups with full laboratory facilities. Inquiries and applications should be addressed to Dr. Sam Parker, director of psychiatry, Kings County Hospital, Brooklyn 3.

Norway Withdraws Embargoed Sardines.—The Norwegian government has voluntarily agreed to withdraw 1,000 cases of Norwegian sardines embargoed by the New York City Health Department from the New York City market, Health Commissioner Israel Weinstein announced March 7. An investigation following an outbreak of 20 cases of mild food poisoning among New Yorkers (The Journal, January 4, p. 50) has been carried on by both the Norwegian government and the New York City Health Department. The investigation, Dr. Weinstein said, indicated that a very small number of cans had sprung leaks and allowed bacteria to get into the cans. A small percentage of aluminum cans were found with defective seams. In Norway the Norwegian canning industry, which is under sanitary supervision by the government, has instituted rigid control over seaming equipment and practices.

Scroll Commemorates Founding of A. M. A.—In recognition of the approaching centennial celebration a scroll commemorating the founding meeting of the American Medical Association was presented to Dr. Currier McEwen, dean of New York University's College of Medicine at the annual alumni day dinner of the college, February 21. More than 250 alumni of the College of Medicine attended. The scroll, commemorating the National Medical Convention of May 1846, was presented to Dean McEwen by Dr. Nathan B. Van Etten, New York City, Past President of the American Medical Association. The scroll was signed by Dr. Van Etten, Dr. William C. White, president of the Medical Society of the County of New York, and Dr. Hippolyte M. Wertheim, New York City, president of the College of Medicine Alumni Association. This year also marks the one hundredth anniversary of the formal association of the faculty of the New York University College of Medicine and Bellevue Hospital, Dean McEwen said in his speech of acceptance. In 1847 a permanent medical board was set up by the city to supervise medical care and teaching at the hospital. Included on the board were a number of the faculty members of New York University. This was the beginning of a relationship which has continued uninterruptedly and has grown to a point where the faculty of the college is now responsible for the care of more than three fourths of the patients at Bellevue Hospital, the dean said. In conjunction with the dinner and other Alumni activities, Dr. Claude E. Heaton, College of Medicine faculty member, opened an exhibit of one hundred years of medicine in New York. Chancellor Harry W. Chase of New York University was a speaker at the dinner, as were Homer W. Smith, Sc.D., professor of physiology at the college, and Dr. Wertheim.

OHIO

University News.—Extensive preparations for a fund raising campaign in behalf of the University of Cincinnati College of Medicine were announced late in February by Dr. Eslie Asbury, Cincinnati, general chairman of the committee of local physicians and surgeons. Funds are sought for strengthening and enlarging the department for earlier years of medical training to keep the school at its present professional level.

PENNSYLVANIA

Society News.—At a joint meeting of the Reading Eye, Ear, Nose and Throat Society and the Diplomates Association of Berks County physicians, February 19, Dr. Eugene P. Pendergrass, Philadelphia, gave an address on "Atomic Energy in Medicine."

Charles Hatfield Honored.—Dr. Charles J. Hatfield, associate director and chairman of the board of trustees of Henry Phipps Institute for the Study, Treatment and Prevention of Tuberculosis, Philadelphia, was honored at an informal tea January 30 on the occasion of his eightieth birthday. The group in attendance represented the institute, the Pennsylvania Tuberculosis Society, the Philadelphia Tuberculosis and Health Association and other friends. In the absence of Dr. Esmond R. Long, director of the institute, because of illness, Dr. Frank A. Craig of the institute presided. Dr. Hatfield was presented two bound volumes of letters from friends, who took this means to pay tribute to him for his more than forty years of work and leadership in the tuberculosis control movement in Pennsylvania and throughout the country. He has also served twenty-five years as trustee for the University of Pennsylvania.

Philadelphia

Woman's Auxiliary Aids Student Loan Fund.—The Woman's Auxiliary to the Philadelphia County Medical Society has prepared and published "A Cook Book for Hungry Doctors," the income from which will go to the Corinna Keen Freeman Student Loan Fund and for other benevolent purposes. Here are the favorite recipes of some of Philadelphia's most distinguished physicians. The book is beautifully prepared and cleverly illustrated. Copies may be obtained by writing to the chairman, Mrs. Hugh Robertson, Twenty-First and Spruce streets.

TENNESSEE

Degree Granted in Medical Technology.—The University of Tennessee College of Medicine, Memphis, granted its first certificate in medical technology last December. Students entering the course with two years' previous college training will receive a certificate after fifteen months' additional work in technology, while those entering with three years' previous college training will receive a B.S. degree in addition to the certificate. Dr. Douglas H. Sprunt, Memphis, reports numerous requests from doctors and hospitals for technologists.

TEXAS

University News.—Chauncey D. Leake, Ph.D., vice president of the University of Texas, Galveston, delivered the William Snow Miller Lecture, "Letheon: The Cadenced Story of Anesthesia," March 18, in the auditorium of the university. The lecture was prepared as a tribute to the centennial of ether and chloroform anesthesia and was sponsored by the Phi Beta Pi fraternity.

Grant for Memorial Lectureship.—A five year grant of $2,500 to Southwestern Medical College, Dallas, for the establishment of the Charles P. Guerriero Sr. Memorial Lectureship in Obstetrics and Gynecology has been received. The fund is a gift of Dr. William F., Dallas, and George W. Guerriero, Monroe, La., in memory of their father. The lectures will be open to physicians, medical students, nurses and interested persons in allied professions.

WASHINGTON

Dr. Pullen Named Director of Hospital Planning.—The appointment of Dr. Roscoe L. Pullen, New Orleans, as associate professor of medicine and director of hospital planning at the new University of Washington Medical School, Seattle, was recently announced by Dr. Edward L. Turner, dean of the school. Dr. Pullen graduated at Northwestern University Medical School, Chicago. Before coming to Seattle Dr. Pullen was assistant director of the Charity Hospital of Louisiana, New Orleans.

WEST VIRGINIA

Superintendent Appointed.—Dr. Philip Johnson, Fairmont, has been appointed superintendent of Fairmont Emergency Hospital to succeed Dr. Chesney M. Ramage, who resigned, effective January 1. The appointment was made by Governor Clarence W. Meadows. Dr. Johnson served in the medical corps with the rank of major during World War II, being assigned to a hospital in France for over a year.

Personal.—Dr. Newman H. Dyer, Charleston, state health commissioner, has been appointed a member of the governing council of the southern branch of the American Public Health Association.——Dr. Andrew P. Sackett, medical officer in charge of Kanawha Valley Medical Center (VD), South Charleston, has been appointed acting director of the bureau of venereal disease control in the state health department. Dr. Sackett will continue as medical officer in charge of the rapid treatment center in South Charleston.

WISCONSIN

Industrial Clinics.—Industrial medical inplant clinics scheduled for Racine April 8, Fort Atkinson April 9 and Green Bay April 10 are being presented by the council on scientific work of the State Medical Society of Wisconsin in cooperation with the committee on industrial health of the Wisconsin State Medical Society and the industrial hygiene unit of the state board of health. Subjects to be discussed at Racine are exposures of hot metals, heavy machinery, dust, fumes, solvents and eye injuries; at Fort Atkinson, exposures of foundry paints, handling of sheet metals and eye injuries, and at Green Bay, exposures of rollers, damp working conditions, chemical solvents and eye injuries.

GENERAL

Swiss Red Cross Chief Resigns.—Max Huber, Swiss acting president of the International Committee of the Red Cross, has resigned, according to the New York *Times*. Ernest Bloer and Martin Bedmer have been appointed to undertake the president's duties for this year.

Special Society Elections.—At the recent first annual meeting of the Southern Society for Clinical Research, New Orleans, Dr. Tinsley R. Harrison, Dallas, Texas, was elected president; Dr. William J. Darby Jr., Nashville, Tenn., vice president, and Dr. Thomas Findley, New Orleans, secretary and treasurer.

Research on Pollen Extracts.—Through a grant of $1,500 for research on the standardization and purification of pollen extracts from Marcelle Cosmetics, Inc., Chicago, the American College of Allergists will continue the studies started over a year ago by its standardization committee. These studies will be under the direction of Morris Scherago, D.V.M., head of the department of bacteriology of the University of Kentucky.

Psychiatric Foundation Formed.—Under the sponsorship of the American Psychiatric Association and the American Neurological Society, a Psychiatric Foundation has been formed to train psychiatrists, psychiatric nurses, psychiatric social workers, psychologists, occupational therapists and allied workers. It also will establish a program of research into causes and cures of mental diseases, take the lead in modernizing and broadening existing laws related to psychiatry and give special emphasis to the development of child psychiatry.

International Medical Congresses. — On March 7 a preparatory conference was held in Unesco-House, Paris, for the creation of a permanent bureau of international medical congresses. It was attended by the presidents or delegates of seventeen international medical congresses and associations, together with representatives of the World Medical Organization. The creation of a permanent bureau to encourage and develop international congresses in the medical sciences was considered.

Psychiatric Clinics for Children.—The American Association of Psychiatric Clinics for Children had at the beginning of this year twenty-nine member clinics and four associate member clinics. The association, founded last November, is designed to act in an advisory capacity to the National Committee for Mental Hygiene. The officers of the association are Drs. Frederick H. Allen, Philadelphia, president; Harry M. Little, Pittsburgh, vice president, and Frederick Rosenheim, Boston, secretary-treasurer.

Campaign to Combat Multiple Sclerosis.—At a meeting of neurologists of the United States and Canada at the Academy of Medicine, New York, February 21, a campaign to combat multiple sclerosis was inaugurated. According to Dr. Tracy J. Putnam, New York City, honorary chairman of the newly organized Association for the Advancement of Research in Multiple Sclerosis (The Journal, Oct. 19, 1946, p. 402), this is the first time that leading neurologists have directed attention on a national basis to a crippling disease which attacks men and women during the most useful periods of their lives.

Awards for Research.—Dr. Irving S. Wright, New York Hospital, New York City, and the College of Veterinary Medicine, University of Illinois, Chicago, are the recipients of two research grants recently made by Sharp and Dohme, Inc., Philadelphia. The grant to Dr. Wright will partially support research he has initiated on peripheral vascular diseases, particularly thrombosis. The University of Illinois grant will afford increased support to a research program under the direction of Dean Robert Graham and associates on the value of various sulfonamides in the treatment of diseases of livestock and poultry.

Pediatricians Appoint Liaison Officer.—Dr. George F. Munns, Winnetka, Ill., was recently appointed by the board of the American Academy of Pediatrics as liaison officer between the academy and the National Society for Crippled Children and Adults. Dr. Munns, who will counsel the society in its nationwide program, is a clinical instructor in pediatrics at Northwestern University, a member of the Chicago Pediatric Society and of the Society for Research in Child Development and associate attending physician at Children's Memorial Hospital, Chicago. He received his M.D degree at the University of Cincinnati.

Book Center for War Devastated Libraries. — The American Book Center for War Devastated Libraries has been urged to continue meeting the need for American publications at least through 1947. The book center is therefore making a renewed appeal for American books and periodicals, for technical and scholarly books and periodicals in all fields and particularly for publications of the past ten years. The generous support which has been given to the Book Center has made it possible to ship more than 700,000 volumes abroad in the past year. It is hoped to double this amount before the book center closes. Books and periodicals which can be spared are urgently needed and will help in the reconstruction which must preface world understanding and peace. Ship contributions to the American Book Center, % the Library of Congress, Washington 25, D. C., freight prepaid, or write to the center for further information.

Wendell Stanley to Receive Chemist's Medal.—The award of its 1947 Willard Gibbs medal to Wendell M. Stanley, Ph.D., Rockefeller Institute for Medical Research, Princeton, N. J., and Nobel Prize winner in chemistry last year, was announced by the Chicago section of the American Chemical Society March 8. The medal goes to Dr. Stanley in recognition of his discoveries in the chemistry of viruses. The award will be presented at a meeting of the Chicago section May 23. Dr. Stanley received his Ph.D. from the University of Illinois in 1929 and his Sc.D. from Harvard University in 1938. Other honors he has won include the American Association for the Advancement of Science prize in 1936, the Rosenberger Medal, University of Chicago, in 1938, the Adler Prize from Harvard in 1938 and the gold medal of the American Institute in 1941. Dr. Stanley spoke at a meeting of the University of Illinois section of the American Chemical Society at Urbana February 20 on the influence of vaccine on influenza.

FOREIGN

Awarded Albert Medal.—Sir Alexander Fleming, University of London, and Sir Howard W. Florey, Oxford University, jointly received the Albert Medal of the Royal Society of Arts this year for their services in the discovery and development of penicillin. It was handed to them privately by Viscount Bennett, president of the society.

Smallpox Epidemic.—The Burmese government, to halt a smallpox epidemic at Rangoon, began this week to evacuate 100,000 refugees who came to Rangoon to escape rural robber bands, the Associated Press reports. The smallpox death rate has risen to 30 per cent of reported cases. The minister of social service said that 30,000 mat huts will be torn down and the refugees moved to a settlement outside the city.

Marriages

William J. Borgsmiller, Murphysboro, Ill., to Miss June Christine Knox of Wetmore, Mich., in Chicago Dec. 21, 1946.

William Chapman Butz, Darlington, Wis., to Miss Christine Frances Westbrook in Ancon, Canal Zone, recently.

Duane Montgomery Kline Jr., Baxter Springs, Kan., to Miss Joanna Gleed Wagstaff of Lawrence, Kan., in October.

Frederick Ward Allen Jr., Rutherford, N. J., to Miss Gloria Lillian Immenhausen of Chicago, Aug. 31, 1946.

Cyril Eustace Bousfield, Woolwich, Maine, to Mrs. Sarah Bagley Wright at Arlington, Mass., January 1.

Lauren Osborne Gibson, Statesville, N. C., to Mrs. Ruth Whitten of Hillsboro, Ill., Dec. 27, 1946.

Frank Reece Wrenn Jr. to Miss Martha Elizabeth Sullivan, both of Anderson, S. C., Dec. 19, 1946.

Robert J. Muench, Des Plaines, Ill., to Miss Florence L. Alexander in Melrose Park November 3.

Thomas J. McKean, Montpelier, Ind., to Mrs. Grace Nordman of Cairo, Ill., November 7.

Robert Ashley Hall, Paintsville, Ky., to Miss Helen Lee Mayo in Louisville, Dec. 21, 1946.

Norton S. Brown to Miss Ilka Chase, both of New York, in Las Vegas, Nev., recently.

Richard A. Betts and Miss Aileen Boutin, both of Spokane, Wash., Dec. 21, 1946.

Deaths

Harry Plotz, consultant to the Secretary of War and during the war chief, division of virus and rickettsial diseases at the Army Medical School in Washington, D. C., died in the Walter Reed General Hospital January 6, aged 56, of old and recent occlusions of the coronary arteries with infarcts of the heart. Dr. Plotz was born in Paterson, N. J., on April 18, 1890. He received his medical degree from the Columbia University College of Physicians and Surgeons in New York in 1913 and interned at Mount Sinai Hospital in New York. When World War I began he went to Siberia with the Red Cross Typhus Commission to help fight an epidemic and worked there until 1916, when he became an adviser to the Surgeon General in Washington on problems of sanitation. He invented an army delouser and he fought typhus in Poland and Russia after the war. During World War I he attained the rank of lieutenant colonel. In 1921 Dr. Plotz became associated with the Pasteur Institute in Paris as director of laboratories and was the first American to be named to its permanent staff. His work on measles was exceptional and he collaborated in developing a technic which made possible the mass production of a vaccine against typhus fever of the European type. In 1940 he joined the Harvard University laboratory as a visiting physician and in the following year reentered the Army of the United States as one of the original members appointed by the President to serve on the United States Army Typhus Commission, retiring one year ago with the rank of colonel. While at the Army Medical Center in Washington he established the virus and rickettsial section of the Army Medical School. He was a trustee of the Ella Sachs Plotz Foundation for the Advancement of Medicine, which was founded in memory of his wife, who died in 1922. Dr. Plotz was an officer of the Legion of Honor and held the Legion of Merit, the Typhus Commission Award and several Serbian and Bulgarian decorations. He was a member of the Association of Immunology, the Society for Experimental Biology and Medicine, the Harvey Society and other scientific organizations.

Sidney Mainer Lister ⊕ Houston, Texas; born in Colita, Texas, Nov. 13, 1875; Barnes Medical College, St. Louis, 1898; fellow of the American College of Surgeons; past president of the Harris County Medical Society; an examining physician for Selective Service during World wars I and II; member of the city and state boards of health and for many years on the state prison board; vice president and director of the Gibralter Building and Loan Association; one of the founders and twice served as head of the Jefferson Davis Hospital; served as chief of the staff of the Memorial Hospital, where in 1940 he was awarded a medal for thirty-two years of service on the staff and where he died Nov. 16, 1946, aged 71, of arteriosclerotic heart disease.

Samuel Alexander Thompson ⊕ Camden, Ark.; born in Glenville, Ark., in 1889; University of Arkansas School of Medicine, Little Rock, 1914; past president of the Ouachita County Medical Society and the Fifth Councilor District Medical Society; for many years chairman of the state maternal and welfare committee of the Arkansas Medical Society; member of the executive board of the Arkansas Association for the Crippled; served as chief medical examiner for the Ouachita Selective Service Board during World War II and on the advisory committee of the Children's Bureau in Washington, D. C.; past president of the Lions Club; member of the chamber of commerce; died in Little Rock Nov. 24, 1946, aged 57, of glioblastoma.

Luke B. Stephens, Paris, Texas; Baylor University College of Medicine, Dallas, 1905; member of the American Medical Association, Fourteenth District Medical Society and the Texas Oto-Laryngological Society; for many years a member of the school board; past president of the Lamar County Medical Society; veteran of the Spanish-American War and World War I; during World War II was a member of the Texas Defense Guard and served on the local Selective Service Board; on the visiting staffs of St. Joseph's and Lamar hospitals; died while on a deer hunting trip near Llano Nov. 18, 1946, aged 70, of coronary heart disease.

Max Brav, Dayton, Ohio; National Medical University, Chicago, 1906; died in the Miami Valley Hospital Nov. 13, 1946, aged 67.

William Howard Carpenter ⊕ Woodbury, N. J.; University of Pennsylvania Department of Medicine, Philadelphia, 1892; served during World War I; for many years medical director of the Girard Life Insurance Company of Philadelphia and medical examiner for many insurance companies; formerly director of the Salem (N. J.) National Bank and Trust Company; died in the Underwood Hospital Dec. 15, 1946, aged 75, of carcinoma of the prostate.

William Oscar Clarke, Hibbing, Minn.; University of Minnesota Medical School, Minneapolis, 1938; served a rotating internship at the Minneapolis General Hospital and a residency in internal medicine at the University Hospitals, where he had been a teaching fellow in internal medicine; served in the medical corps of the Army of the United States during World War II; died at Rawah Ranch, Glendevey, Colo., June 17, 1946, aged 36, of coronary occlusion.

Charles G. Cook, Weimar, Texas; Medical Department of Tulane University of Louisiana, New Orleans, 1897; member of the American Medical Association; past president and secretary of the Colorado County Medical Society; veteran of the Spanish-American War; school trustee and city health officer; died Nov. 6, 1946, aged 71 of cerebral hemorrhage.

Herbert Jones Erwin, Gastonia, N. C.; Leonard Medical School, Raleigh, 1908; affiliated with the Gaston County Negro Hospital; died Dec. 29, 1946, aged 67, of congestive heart failure.

Richard Bland Ford, Corpus Christi, Texas; University of Oklahoma School of Medicine, Oklahoma City, 1928; member of the Oklahoma State Medical Association; served in the medical corps of the U. S. Naval Reserve during World War II; died Nov. 30, 1946, aged 45.

Isabelle Parker Gibby, Brighton, Mass.; Boston University School of Medicine, 1893; died Nov. 22, 1946, of arteriosclerotic heart disease.

Jacob Casper Hutzelman ⊕ Glendale, Ohio; Ohio-Miami Medical College of the University of Cincinnati, 1913; served on the staff of the Mercy Hospital in Hamilton; died Dec. 12, 1946, aged 63, of heart disease.

Irvin Arthur Ihrke, Oshkosh, Wis.; Rush Medical College, Chicago, 1934; member of the American Medical Association; interned at Oak Park (Ill.) Hospital; formerly city physician; served in the medical corps, Army of the United States, overseas during World War II; died Dec. 4, 1946, aged 41, of bronchopneumonia.

John Roland Lynn ⊕ Hazen, Ark.; Memphis (Tenn.) Hospital Medical College, 1887; honorary member of the Arkansas Medical Society; served as president of the Prairie County Medical Society; surgeon for the Rock Island Railway; formerly member of the state and county boards of health; city health officer; died Dec. 2, 1946, aged 79, of heart disease.

Howard Albert Mahaffey, Hillsboro, Texas; University of Louisville (Ky.) Medical Department, 1903; member of the American Medical Association; past president of the Hill County Medical Society; county health officer for many years; local physician for the Missouri, Kansas and Texas Railroad for many years; examining physician for Selective Service in Hill County during World War II; died in Fort Worth Nov. 3, 1946, aged 72, of bronchogenic carcinoma of the right lung.

Frederick M. Mullino, Montezuma, Ga.; Southern Medical College, Atlanta, 1892; past president of the Macon County Medical Society; died in the Macon County Clinic Dec. 12, 1946, aged 79, of injuries received in an automobile accident.

Leonard Albert Myers ⊕ Houston, Texas; University of Oklahoma School of Medicine, Oklahoma City, 1922; member of the Texas Radiological Society and the Radiological Society of North America; on the staff of the Memorial Hospital; died Nov. 29, 1946, aged 50, of coronary thrombosis.

Edward Rodgers Neeper ⊕ Colorado Springs, Colo.; Keokuk (Iowa) Medical College, 1891; member of the American Academy of Ophthalmology and Otolaryngology; on the staff of the Glockner Sanatorium and Hospital; died Nov. 21, 1946, aged 79, of uremia.

Arthur John Nugent, Worcester, Mass.; Maryland Medical College, Baltimore, 1908; died Nov. 21, 1946, aged 66, of cerebral hemorrhage.

Arthur Lloyd Parks ⊕ Rome, Pa.; University Medical College of Kansas City, Mo., 1910; past president of the Bradford County Medical Society; served as mayor of Rome, U. S. pension examiner, health officer, state school inspector and examiner for the Veterans Administration; died Dec. 13, 1946, aged 63, of aneurysm of the aorta.

Edward Andrew Weir, Portland, Ore.; Harvard Medical School, Boston, 1893; formerly associated with the U. S. Public Health Service; died in the Veterans Administration Hospital, Roseburg, Nov. 4, 1946, aged 79, of acute ventricular failure.

No Medical Journals

The prolonged spell of arctic weather has produced a dangerous reduction of accumulated supplies of coal, which in turn has led to cuts in the supply of electricity and to the restriction of the production of newspapers which require electric power. Excepting daily and certain weekly newspapers dealing with general current news of a particular locality, all newspapers must cease publication from February 17 for a minimum period of two weeks. This restriction covers all the technical journals, including the medical. Thus the *British Medical Journal* and the *Lancet* announce that they do not expect to be able to publish in the next two weeks. The *British Medical Journal* states that on May 10, 1941 the *Journal's* printers were destroyed by German bombs but production was uninterrupted. The *Lancet* recalls that the general strike of 1926 reduced its weekly issue to a single sheet. But never before has the reading medical public been faced with the total suppression of issues. The only new element in the situation is a socialist government. But for the government it is argued that to make political capital out of a natural phenomenon—the prolonged arctic spell—is not fair. But this reply does not meet the criticism that the government should have in time built up a coal reserve for the bad weather always a possibility at this time of year. Instead it gambled on its absence. Further, there is the criticism that giving way to ever repeated demands of the unions for higher wages, characteristic of the socialist government, without ensuring greater output, has made coal a much more expensive item for the private consumer as well as for industry. If increased efficiency kept pace with increased wages, increased cost would not have followed. Government tampering with the coal industry began in the war, since which coal has doubled in price. Socialism can easily enact higher wages but never seems to ensure increased efficiency. That is not what the unions want, though they pretend that increased wages make for greater efficiency. In regard to production, the one thing the unions have always stood for is limitation of output. Government spokesmen tell the workers that whatever justification there may have been in the past for limitation of output, that need has now passed and every one should do his best. They are even reduced to imploring workers to do so, the only method—an ineffectual one—left after abolishing the competition of private enterprise and guaranteeing work to all regardless of how they perform it. The British public will learn soon more of the ill results of a system which removes all incentive to work well.

Negotiations With the Minister on the Health Service

As stated in a previous letter, the British Medical Association has decided to negotiate with the minister of health as to the best possible health service provided such discussions are comprehensive in their scope and the possibility that they may lead to further legislation is not excluded. After these discussions it is proposed to take a second plebiscite of the profession on the issue of entering the service. The *British Medical Journal* considers it highly gratifying that the representatives of the constituent bodies at the last meeting, at which representatives of the three Royal Colleges were present, had the wisdom to sink their differences by accepting the terms of the minister's invitation. It is noteworthy that his attitude is very different from his earlier one, when he declined to negotiate on important matters. He has climbed down from his autocratic position. Incidentally it may be pointed out that we are back to the characteristically English method of settling everything by compromise.

Central Health Council for National Health Service

The minister of health, Mr. Aneurin Bevan, has written to various organizations asking them to submit the names of suitable candidates for membership of the Central Health Council which he has to appoint under the National Health Service Act. The act provides that there shall be forty-one members of the council, of whom six shall be ex officio. The council is to include fifteen medical practitioners, of whom two must have knowledge of mental illness, five laymen with experience of hospital management, five laymen with experience in local government, three dental practitioners, two experts in mental health services, two registered nurses, one certified midwife and two registered pharmacists.

The British Journal of Nutrition

The cessation of the war has been followed by the publication of a number of new medical journals. The latest is the *British Journal of Nutrition,* a quarterly of which the first number is to appear in the first half of the year. It is not entirely new, for it will replace under the same auspices the *Proceedings of the Nutrition Society.* The chairman of the editorial board is Dr. S. K. Kon of the National Institute for Research in Dairying.

ITALY

(From Our Regular Correspondent)

Feb. 1, 1947.

Age Limits for University Professors

Italian university professors are required to give up teaching at the completion of the seventieth year of age. The secretary (minister) of public education proposed to the council of ministers that the age limit for university professors should be extended to the seventy-fifth year, since several university faculties and various councils of the association of the university professors have voted in favor of such prolongation. Many of the present day professors started their career when, according to the law, the age limit was still 75. It seems only fair that the same treatment should be granted to all, since the age limit has actually been extended for those professors who after having been removed from their teaching positions on political or racial grounds have now resumed teaching. The majority of professors are well fit for praiseworthy service up to the seventy-fifth year of age and their removal is to be considered as an undeserved "diminutio." One must also take into account that the masters may be forced to abandon prematurely the pupils of their school, who only could reach their final goal, i. e. university teaching assignment, by continuing their studies under the tutorship of their teachers for additional years. The economic reasons are the strongest, since the university professors who would go into retirement could not support themselves according to their standards on their pensions. Some faculties have expressed the opinion that the age limit should not be prolonged in order that the pensions may be conveniently increased, and that as a reward for the grant of higher pensions the retiring professors should be bound to hold conferences at the university and some courses so that the pupils should not be deprived of the aid of their masters. Other university faculties have abstained from voting for the proposal of restoring the age limit to the seventy-fifth year. The council of ministers has not yet come to a definite conclusion because of the divided opinions but has found a temporary solution by renewing for one year the teaching assignment of those professors who have completed their seventieth year.

Campaign Against Tuberculosis

The considerable increase in mortality from tuberculosis in Italy as a result of the war is receiving the attention of responsible circles concerned with the campaign against tuberculosis. The executive committee of the Italian Federation Against Tuberculosis held a meeting in Rome to examine the various antituberculosis institutions and see what may be expected from the support which the parliamentary medical group may give to the reform of the antituberculous organizations. The council decided that the first national congress for the campaign against tuberculosis should be held in Milan next year to celebrate the hundredth anniversary of Carlo Forlanini.

The regional antituberculosis association Lazio-Umbria also had a meeting at the Institute Carlo Forlanini in Rome with about thirty physicians and numerous officials attending. Professor Omodei-Zorini, director of the institute, read a paper on extrapleural pneumothorax, which is based on the biophysiologic concepts of Forlanini and which represents a form of treatment midway between intrapleural pneumothorax and thoracoplasty. The problems which result from the use of this method are the object of studies by Italian phthisiologists. Based on scientific and clinical proof, Professor Omodei-Zorini examined all the aspects of the new therapy and outlined the fundamental criteria and the clinical indications for extrapleural pneumothorax.

Professor Carlo Cattaneo reported on modern chemotherapy in the field of tuberculosis. In the discussion of Cattaneo's report action was agreed on against those who were publishing miraculous notes in the field of antituberculous therapy. Professor Nello Montanini reported on the formation of interbronchial anastomosis and presented a new concept of the pulmonary circulation of the air which was based on the results of a personal study.

A center of applied psychology was inaugurated at the Forlanini Institute for the rehabilitation of those who have been discharged from sanatoriums and for facilitating the readjustment to work in every field by ensuring postsanatorium care for them. The inaugurating ceremony was attended by Hon. Dr. Gasperi, president of the Council of Ministers, who expressed the interest of the government in the problem.

Congress of Psychoanalysts

The first congress of Italian psychoanalysts was held in Rome. Professor Servadio paid tribute to Sigmund Freud. Papers then were read by a number of investigators.

Flescher, who many times previously had applied the method of psychoanalytic research to the phenomena of politics, reported a study on mass psychology. In contrast to Freud, who believed that sublimated erotic causes may be considered as the main motive which induces the individual to gregariousness, the speaker attributed this phenomenon rather to fear and to the need for protection. The projection of the superego, in the figure of the leader, a phenomenon which causes a moral involution of the masses returning to an infantile phase, may be considered as a consecutive phenomenon. Next to the moral regression of the masses due to the phenomenon of collectivization, Flescher furnished evidence of the moral involution which is frequently due to methods used by their leaders, who are the symbols of the individual superego.

Perotti analyzed several patients who presented anguish and fear of Communism; he observed that in reality these patients were afraid of the annihilation of their proper ego in front of the feared irruption of the sexual and aggressive instincts, i. e. of the id.

Di Palma spoke on psychoanalytic technics; he suggested that in the diagnosis of mental infirmity which is accessible to psychotherapy (as an example, the obsessional neuroses, the hysteric phobia) one should differentiate the neuroses of transfer from the disturbances of character due to lesions of the superego during childhood. Pardi discussed the relationship between psychoanalysis and the study of the behavior of animals.

Servadio discussed revision of the concept of the Oedipus complex; in his opinion and in that of many other psychoanalysts, this concept should be modified and extended to object relationship also in earliest infancy.

Merloni discussed the affective bases of punishment and of the psychology of judges. The judges, who are bound to pass an objective and rational sentence on the defendant, may often act under the impulse of the irrational instincts which determine the feeling of punishment in other human beings, i. e. vengeance against the one who offends society and expiation on the part of one who allows the irruption of the instincts of the id. The speaker is convinced that conscience can not be gained from irrational motives which are based actually on punishment and that true justice cannot result from this type of psychology of the judge.

Health Referendum

The high commissioner for public health has named a committee for the study of health reforms in Italy, and three representatives of the medical parliamentary group are members of this committee. Prior to the advancement of concrete proposals for modification of the health law the medical parliamentary group submitted a referendum to all Italian physicians on the principal problems of a health character. The items to be considered are health reorganization of the state; reform of medical studies according to medical progress and the health needs of the country; reports of the medical profession and of the mayoralties; reports of clinics and of hospitals; charity funds; mutual insurance; the duties of the physician employed by the community to give medical assistance gratuitously to the poor; pensions of health personnel; occupational diseases; social diseases; problems of maternity and of infants; medical specialties; the auxiliary arts of medicine; various problems.

BRAZIL

(From Our Regular Correspondent)

SÃO PAULO, Feb. 16, 1947.

Anesthesia in Cesarean Section

A review of 559 cases of anesthesia in cesarean sections performed in the obstetric ward of the University of São Paulo Faculty of Medicine was made by Drs. B. Neme and Jutahy Esteves of the service of Professor Raul Briquet. Spinal anesthesia was used in 74.9 per cent, inhalation in 16.8 per cent, peridural in 2.9 per cent, sacral in 0.5 per cent and intravenous in 0.3 per cent. Pointing out the depressive action of analgesic drugs and anesthetic gases, Drs. Neme and Jutahy stated that a higher incidence of resuscitation is encountered after inhalation anesthesia than after spinal block, 15:6, in spite of a larger number of serious cases included in this group. To reduce immediate accidents and complications, the death rate (0.71 per cent) and hypotensive states (2.3 per cent) spinal anesthesia should be administered only by the trained anesthetist. Complementary anesthesia was necessary in 6.9 per cent of spinal, 15.3 per cent of epidural, 31.2 per cent of local and 100 per cent of venous anesthesias. According to Drs. Neme and Jutahy the danger of spinal block is highly overrated, as it was used in the hypertensive syndrome (65.4 per cent), placenta previa (66⅔ per cent), abruptio placentae (47.6 per cent) and heart trouble (42.8 per cent). However, spinal block is no longer used in hypertensive conditions or in toxic abruptio placenta. In the obstetric clinic where these figures were obtained spinal block is favored, providing good uterine retraction, excellent abdominal relaxation and almost complete atoxicity in addition to being harmless to mother and child.

The Clinical Forms of Amebiasis

Drs. F. Cintra do Prado and F. Figliolini, professors of the Escola Paulista de Medicina, São Paulo, describe the clinical forms of amebiasis and point out their respective frequency, based on 500 cases. The acute dysenteric form represented the beginning of amebiasis in only 15 per cent of the cases. In the remaining 85 per cent the illness developed in a slow and insidious manner; when the patients started attending the clinic the amebiasis had already become chronic, and it was often impossible to determine the exact time it began.

They divided the chronic forms of amebiasis into intestinal (80 per cent), paraintestinal (10 per cent) and mixed (10 per cent). They found that in the intestinal forms the clinical characteristics were obstipation (50 per cent of the patients), diarrhea (25 per cent), chronic dysentery (10 per cent) or periodic dysentery (15 per cent). In the paraintestinal chronic forms certain symptoms surpassed in importance the complaints concerning the intestine; in this group of patients a predominance of hepatobilious symptoms (50 per cent) or of psychoneurotic reactions (30 per cent) or of nutritive disturbances (20 per cent) was observed. The symptomatology was complex, without any predominance of intestinal or paraintestinal characteristics, in the mixed forms.

Curare

Drs. João S. Campos and Oswaldo V. Brazil report the use of curare and a curare substitute, bebeerine dimethylether methochloride, in the prevention of traumatic complications in convulsive shock therapy and in the treatment of spastic syndromes. Both the curare used and the bebeerine derivative showed a pure curarizing action. Side effects (such as cephalalgia, blood pressure depression and bronchial spasm) evoked by some curares and curarine were absent. Electrocardiograms were not altered of 4 patients during curarization with bebeerine dimethylether methochloride. For excessive curarization the authors suggest the intravenous injection of neostigmine. Thirty patients were given 239 shocks (electrical and metrazol shocks) with preliminary curarization as convulsive agents. Traumatic complications were not observed. Muscular pains were also prevented.

Drs. Campos and Brazil also found that rigidity and contractures from pyramidal and extrapyramidal syndromes could be removed or attenuated by curare or the bebeerine derivative in doses that did not prevent voluntary motility. Their action was of short duration (two or three hours), but in some cases improvement in the spasticity was still present twenty-four to forty-eight hours later.

Bebeerine dimethylether methochloride was used with good results in 2 cases of tetanus. The trismus, opistotonos and convulsive seizures could be suppressed; a two or three hour period of muscular relaxation followed the injection of the bebeerine derivative. Bennett's opinion that curare therapy offers more possibilities than sedative therapy in controlling tetanic convulsion is shared by Drs. Campos and Brazil.

The authors discuss the advantages resulting from the use of a chemically defined and strongly curarizing compound, bebeerine dimethylether methochloride, instead of curare, a mixture of variable composition, strength and origin.

Protective Antibodies Against Human Epidemic Influenza

Dr. Lucas Assumpção reports a study of protective antibodies against human epidemic influenza A virus (W. S. strain) in the serums of normal adults and children living in the city of São Paulo. None had a preceding clinical history of recent influenza or febrile cold. The protection experiments were made with Swiss mice. In the serum of children between 1 and 3 years of age the protection experiments were negative even when pure serum was used. With the adult serums 82.9 per cent were positive and 17.1 per cent negative.

The high percentage of individuals with antibodies against human epidemic influenza A virus (W. S.) proves that the influenza type caused by this virus is common in São Paulo. Protection experiments are now in progress with epidemic influenza B virus.

BUENOS AIRES

(From Our Regular Correspondent)

Dec. 6, 1946.

Medical Delegation Visits Buenos Aires

A group from Brazil, with Dr. Antonio Austregésilo as president, and two hundred and fifty delegates recently came to Buenos Aires with the representation of their government to pay a visit to the Argentinean members of the medical profession as represented in the Pan American Medical Congress, which was held in Rio de Janeiro. The delegation remained in Argentina ten days. The government of Argentina and members of the medical profession prepared receptions and medical meetings in honor of the delegates. Dr. Aloysio de Castro, past president of the Academia de Medicina de Rio de Janeiro, addressed the Academia de Medicina of Buenos Aires on the "project for a treaty of South American pathology," which was moved by Dr. Americo Ricaldoni of Uruguay in 1917 and approved by the faculties of medicine of Argentina, Brazil and Uruguay but which has not as yet been put into effect. Dr. Aráoz de Alfaro, the president of the Academia Nacional de Medicina of Buenos Aires answered that he considered this motion of great South American interest.

Geriatrics

A course in geriatrics recently given at the Hospital Británico, under the auspices of the Junta Argentina para el Estudio del Envejecer, included the following lectures: Dr. B. A. Houssay, physiology of old age; Dr. E. B. del Castillo, endocrinology in old age; Dr. A. C. Taquini, geriatrics of cardiovascular system; Drs. A. Casanegra and C. A. Cardini, geriatrics of respiratory and gastrointestinal systems, respectively; Dr. F. E. Krapf, neuropsychiatry in old age; Dr. D. del Valle, geriatrics and surgery, and Dr. A. Trabucco, urogenitary surgery in the old.

Medical Protection of Natives

A committee for the preparation of a Sanitary Census of natives to improve the medicosocial aid given to natives and mestizos was recently appointed through a special decree. The basis of the decree shows that the Secretariate of Public Health will give the natives and mestizos (numbering about 150,000 and 400,000, respectively) the benefits of public hygiene and medicine in accordance with the actual progress in medicine and hygiene.

Public Health

The 1946 budget of the Secretariat of Public Health is fixed at 61,798,675 Argentine pesos (about $15,500,000) of which 21,542,200 pesos is for salaries and 40,256,475 for other expenses.

The Secretariate of Public Health recently created laboratories for studies on yellow fever at the Instituto Bacteriológico Dr. Carlos G. Malbran and the Escuela de Lucha Antiestegómica in Santiago del Estero city.

Personals

Drs. Egidio S. Mazzei and Taylor Gorostiaga of Buenos Aires and Elyeser Magalhaes of Rio de Janeiro were awarded the premio Alvarenga by the Academia Nacional de Medicina del Brazil for their work on "Pulmonary Embolism." The experimental part of this work was carried on at the Instituto de Investigaciones of the Academia Nacional de Medicina of Buenos Aires, of which Dr. Mariano R. Castex is the head.

Drs. Tejerina Fotheringham, Oscar Cames, Juan Asugasti, Fernando Noguera and Oscar Maritofi, all of Argentina, were recently appointed honorary members of the Academia Peruana de Cirugía.

Dr. Mariano R. Castex was recently invited by the Oxford and Paris Universities to lecture there. He is now visiting in England and France.

Bureau of Investigation

MISBRANDED PRODUCTS

Abstracts of Notices of Judgment Issued by the Food and Drug Administration of the Federal Security Agency

[EDITORIAL NOTE.—These Notices of Judgment are issued under the Food, Drug and Cosmetic Act, and in cases in which they refer to drugs and devices they are designated D. D. N. J. and foods, F. N. J. The abstracts that follow are given in the briefest possible form: (1) the name of the product; (2) the name of the manufacturer, shipper or consigner; (3) the date of shipment; (4) the composition; (5) the reason for the charge of misbranding, and (6) the date of issuance of the Notice of Judgment—which is considerably later than the date of the seizure of the product and somewhat later than the conclusion of the case by the Food and Drug Administration.]

Car-Bo-Ak.—John L. Van Houten, Temple City, Calif., and Brunswig Drug Company, Los Angeles. Shipped Nov. 23, 1942. Composition: essentially water, alcohol, and extracts of plant materials, including licorice. Misbranded because falsely represented on label as an alterative, a blood tonic and a relief for rheumatic conditions, improper elimination, autointoxication and skin disorders such as scrofula, carbuncles, boils, styes and acne.—[*D. D. N. J., F. D. C. 1189; June 1945.*]

Citra Nesla.—Monarch Products Company, Los Angeles. Shipped between June 5 and July 6, 1943. Composition: an effervescent solution containing sodium phosphate, sugar, and a citrate. Misbranded because it was simply an imitation of another drug, citrate of magnesia, and because label did not accurately declare the quantity of contents, since the amount was short of the 12 fluid ounces declared on the label.—[*D. D. N. J., F. D. C. 1190; June 1945.*]

Dimels.—Jones-Hague, Inc., McKeesport, Pa. Shipped March 11, 1943. Composition: capsules each containing about 5 grains of a mixture of dried, powdered animal material and kaolin (China clay). The animal material apparently was of a glandular nature, such as pancreas, and contained a small amount of insulin and a starch-splitting enzyme equivalent to ½ of 1 per cent of pancreatin. Misbranded because insulin was not obtained from a batch for which a certificate or release had been issued, as required by law; also misbranded because label statement, "Each capsule contains Hormone Complexes as found in Isles Langerhans" was misleading, in that recommended dosage would not produce the well-known effects of the hormones found in the islands of Langerhans. Further misbranded because falsely represented as useful in treating incipient diabetes.—[*D. D. N. J., F. D. C. 1203; June 1945.*]

Estrovin in Oil.—Adson-Intrasol Laboratories, Inc., New York. Shipped Jan. 28 and March 11, 1942. Adulterated and misbranded because label falsely represented product to contain 5,000 International units of estrogenic ovarian follicular hormones per cubic centimeter, whereas it contained only 1,100 units of these.—[*D. D. N. J., F. D. C. 818, December 1943; and D. D. N. J., F. D. C. 1209, June 1945.*]

Helping Hand Laxative Tonic.—National Medicine Company, Nashville, Tenn. Shipped June 24, 1943. Composition: essentially epsom salt, iron and ammonium citrate, and extracts of plant drugs, including laxative and bitter substances, with a sugar, a benzoate, alcohol and water. Misbranded because falsely represented to be a tonic, to contain glycerin and to have iron and ammonium citrate as active ingredients, and because label did not warn that the product, a laxative, should not be used continually. —[*D. D. N. J., F. D. C. 1204; June 1945.*]

Hi-Lo Tablets.—Hi-Lo Products Company, St. Louis. Shipped April 20, 1943. Composition: essentially dried powdered yeast. Misbranded because carton and bottle labels and accompanying circulars (which carried name "Hi-Lo Anti-Gray Hair Vitamin Tablets—Vitamin B Complex Plus") falsely represented that this calcium pantothenate product would restore natural color to gray hair or prevent graying of it and correct or prevent nervousness, headache, dizziness, rapid heartbeat and numbness of feet and ankles.—[*D. D. N. J., F. D. C. 1244; June 1945.*] Also misbranded under provisions of the law applicable to foods. as reported in *F. N. J. 7344.*

Himrod's Asthma Powder.—Himrod Manufacturing Company, Hoboken, N. J. Shipped Oct. 8 and Nov. 14, 1941. Composition: essentially a mixture of stramonium and potassium nitrate. Misbranded because falsely represented as a treatment for asthma, whereas it was merely a palliative for the acute temporary manifestations of that disease; also misbranded because label gave false impression that the mixture would relieve paroxysms of asthma and hay fever and was a proper treatment for these conditions.—[*D. D. N. J., F. D. C. 1187; June 1945.*]

Imported Sea Vegetables Vitaminized with Added Vitamin A.—Mineralized Foods, Inc., Baltimore. Shipped between Feb. 17, 1942, and Jan. 23, 1943. Composition: dried seaweed. Misbranded because label falsely represented it as supplying mineral and vitamin deficiencies which would cause sinus disorders, colds, apoplexy and some other things.—[*D. D. N. J., F. D. C. 1246; June 1945.*] Also misbranded under provisions of the law applicable to foods, as reported in *F. N. J. 7345.*

Jayne's Vermifuge.—Dr. D. Jayne and Son, Inc., Philadelphia. Shipped Dec. 18, 1943. Composition: essentially extracts of plant drugs and a small amount of potassium carbonate, with sugar, alcohol and water, flavored with peppermint oil. Misbranded because falsely represented to remove large roundworms from children and adults, whereas tests on humans and laboratory animals showed that it did not do this.—[*D. D. N. J., F. D. C. 1237; June 1945.*]

Kalseom Tablets.—Mineralized Foods, Inc., Baltimore. Shipped between Feb. 17, 1942, and Jan. 23, 1943. Composition: claimed to consist of imported variety of sea vegetables, with bone calcium phosphate fortified with vitamins C and D. Misbranded because falsely represented to correct mineral deficiency which results in tuberculosis, asthma, poor teeth, brittle fingernails and other disorders.—[*D. D. N. J., F. D. C. 1246; June 1945.*] Also misbranded under provisions of the law applicable to foods, as reported in *F. N. J. 7345.*

Nuxated Iron.—Dae Health Laboratories, Stamford, Conn. Shipped Jan. 17, 1944. Composition: ferrous sulfate (64 milligrams per tablet), strychnine, compounds of calcium, magnesium and sodium, including carbonates and glycerophosphates and aromatic elements. Misbranded because label falsely represented product as an adequate treatment for run-down conditions and iron deficiency.—[*D. D. N. J., F. D. C. 1247; June 1945.*]

Opera Tablets.—Goodness Bros. Co., Webster, Mass. Shipped Sept. 25, 1943. Composition: a mixture of powdered plant drugs, including buchu, aloe, gamboge, capsicum and ginger. Misbranded because falsely represented as an effective treatment for a wide variety of disorders, including skin diseases, obesity, blood poisoning, fainting spells, dyspepsia, dropsy, anemia, gallstones, epilepsy, appendicitis and melancholia; further misbranded because label did not bear common or usual name of each active ingredient.—[*D. D. N. J., F. D. C. 1188; June 1945.*]

Schaffner's "Little Doc" Jr. First Aid Kit.—Gus. J. Schaffner Company, Avalon, Pa. Shipped Oct. 18, 1943. Adulterated and misbranded because the absorbent cotton in the kit was labeled "Sterilized," whereas it was not sterile, according to the standard of the United States Pharmacopeia. —[*D. D. N. J., F. D. C. 1224; June 1945.*]

Sea-Sol.—Mineralized Foods, Inc., Baltimore. Shipped between Feb. 17, 1942, and Jan. 23, 1943. Composition: soy beans, dried seaweed and sugar, yielding phosphorus, iron and iodine. Misbranded because falsely represented to prevent or correct shortness of breath, rapid heart palpitation, fatigue, stomach disturbances, iron deficiency, beri beri, arthritis and many other things.—[*D. D. N. J., F. D. C. 1246; June 1945.*] Also misbranded under provisions of the law applicable to foods, as reported in *F. N. J. 7345.*

Sea Vegecene.—Mineralized Foods, Inc., Baltimore. Shipped between Feb. 17, 1942, and Jan. 23, 1943. Composition: essentially dried and powdered seaweed containing various amounts of iodine, iron and phosphorus. Misbranded because label falsely represented that product has nutritional significance because of these substances and others not designated.—[*D. D. N. J., F. D. C. 1246; June 1945.*] Also misbranded under provisions of the law applicable to foods, as reported in *F. N. J. 7345.*

Sea-V-Aid.—Mineralized Foods, Inc., Baltimore. Shipped between Feb. 17, 1942, and Jan. 23, 1943. Composition: yeast and vegetable tissue, including seaweed, with other inorganic constituents, such as iodine. Misbranded because misrepresented as having nutritional value due to mineral content, and as being a treatment for unsteady nerves, premature aging, arteriosclerosis, apoplexy, pellagra and some other disorders.—[*D. D. N. J., F. D. C. 1246; June 1945.*] Also misbranded under provisions of the law applicable to foods, as reported in *F. N. J. 7345.*

Sea-Vo-Kra.—Mineralized Foods, Inc., Baltimore. Shipped between Feb. 17, 1942, and Jan. 23, 1943. Composition: powdered okra and dried seaweed, with other inorganic constituents, including iodine. Misbranded because label falsely represented it as a source of food minerals and vitamins A, B, C and D and a remedy for stomach ulcer.—[*D. D. N. J., F. D. C. 1246; June 1945.*] Also misbranded under provisions of the law applicable to foods, as reported in *F. N. J. 7345.*

Sodeom.—Mineralized Foods, Inc., Baltimore. Shipped between Feb. 17, 1942, and Jan. 23, 1943. Composition: dried powdered seaweed, calcium phosphate, calcium carbonate and starch, with iodine and other inorganic constituents, unnamed. Misbranded because falsely represented as to value in treating and preventing arthritis, kidney stones, rheumatic fever, premature aging and some other ailments.—[*D. D. N. J., F. D. C. 1246; June 1945.*] Also misbranded under provisions of the law applicable to foods, as reported in *F. N. J. 7345.*

Stumicaid.—Hoobler & Hazel Laboratory, Dayton, Ohio. Shipped Feb. 25, 1943. Chiefly organic protein material (not identified), with a small amount of plant substance, including anise, and a laxative such as senna. Misbranded because label falsely represented product as a remedy for most stomach ailments.—[*D. D. N. J., F. D. C. 1229; June 1945.*]

West's Imported Sea Vegetable Tablets.—Mineralized Foods, Inc., Baltimore. Shipped between Feb. 17, 1942, and Jan. 23, 1943. Composition: seaweed, representing, per tablet, various quantities of iodine, calcium, magnesium, phosphorus and iron. Misbranded because label falsely represented product as supplying deficient mineral elements in diet which cause arteriosclerosis, apoplexy, high blood pressure and many other disorders. —[*D. D. N. J., F. D. C. 1246; June 1945.*] Also misbranded under provisions of the law applicable to foods, as reported in *F. N. J. 7345.*

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

NATIONAL BOARD OF MEDICAL EXAMINERS EXAMINING BOARDS IN SPECIALTIES

Examinations of the National Board of Medical Examiners and the Examining Boards in Specialties were published in THE JOURNAL, March 15, page 801.

BOARDS OF MEDICAL EXAMINERS

ALABAMA: Montgomery, June 24-26. Sec., Dr. D. G. Gill, 519 Dexter Ave., Montgomery 4.

ARIZONA: * *Examination.* Phoenix, April 1-2. *Endorsement.* Phoenix, April 5. Sec., Dr. J. H. Patterson, 826 Security Bldg., Phoenix.

ARKANSAS: * *Medical. Examination.* June 5-6. Sec., Medical Board of the Arkansas Medical Society, Dr. L. J. Kosminsky, Texarkana. *Eclectic. Little Rock, June 5. Sec., Dr. C. H. Young, 1415 Main St., Little Rock.*

CALIFORNIA: *Written.* San Francisco, July 7-10. *Oral.* San Francisco, May 10-11. *Oral Clinical Examination for Foreign Medical Graduates.* San Francisco, June 21. Sec., Dr. Frederick N. Scatena, 1020 N. St., Sacramento 14.

DELAWARE: *Examination.* Dover, July 8-10. *Endorsement.* Dover, July 15. Sec., Medical Council of Delaware, Dr. J. S. McDaniel, 229 S. State St., Dover.

FLORIDA: * Jacksonville, June 24-25. Sec., Dr. Harold D. Van Schaick, 2736 S. W. Seventh Ave., Miami 36.

GEORGIA: Atlanta and Augusta, March 26-27. Sec., State Examining Boards, Mr. R. C. Coleman, 111 State Capitol, Atlanta 3.

IDAHO: Boise, July 14-16. Sec., Bureau of Occupational Licenses, Dr. S. M. Poindexter, Eastman Bldg., Boise.

ILLINOIS: Chicago, April 1-3. Supt. of Registration, Department of Registration & Education, Mr. *Philip Harman, Springfield.*

INDIANA: *Examination.* Indianapolis, June. Exec. Sec., Board of Medical Registration and Examination, Miss Ruth V. Kirk, 627 K. of P. Bldg., Indianapolis.

KANSAS: *Examination.* Kansas City, March 25-26. Sec., Board of Medical Registration and Examination, Dr. J. F. Hassig, 905 N. Seventh St., Kansas City 10.

KENTUCKY: Louisville, Sept. 22-24. Sec., State Board of Health, Dr. *P. E. Blackerby, 620 S. Third St., Louisville 2.*

MARYLAND: *Medical Examination.* Baltimore, June 17-20. Sec., Dr. E. H. Kloman, 1215 Cathedral St., Baltimore. *Homeopathic.* Baltimore, *June 10-11. Sec., Dr. J. A. Evans, 612 W. 40th St., Baltimore.*

MICHIGAN: * *Examination.* Detroit, June 16-18. Sec., Board of Registration in Medicine, Dr. J. E. McIntyre, 100 W. Allegan St., Lansing 8.

MINNESOTA: * Minneapolis, April 15-17. Sec., Dr. J. F. Du Bois, 230 Lowry Medical Arts Bldg., St. Paul.

MISSISSIPPI: Jackson, June 23-24. Asst. Sec., State Board of Health, Dr. R. N. Whitfield, Jackson 113.

MONTANA: Helena, April 1-2. Sec., Dr. O. G. Klein, First National Bank Bldg., Helena.

NEBRASKA: * *Examination.* Omaha, June. Dir., Bureau of Examining Boards, Mr. Oscar F. Humble, State Capitol Bldg., Lincoln.

NEVADA: *Examination. Carson City, May 5. Sec., Dr. G. H. Ross,* 215 N. Carson St., Carson City.

NEW JERSEY: Trenton, June 17-18. Sec., Dr. E. S. Hallinger, 28 W. State St., Trenton.

NEW MEXICO: * Santa Fe, April 7-8. Sec., Dr. LeGrand Ward, 141 Palace Ave., Santa Fe.

NORTH CAROLINA: *Endorsement.* Winston-Salem, April 30, June 24. *Examination.* Raleigh, June 23-26. Acting Sec., Mrs. L. McNeill, 226 Hillsboro St., Raleigh.

NORTH DAKOTA: Grand Forks, July 1-4. Sec., Dr. G. M. Williamson, 4½ S. Third St., Grand Forks.

OHIO: *Examination. Columbus, June 17-20. Sec., Dr. H. M. Platter,* 21 W. Broad St., Columbus.

OREGON: * *Endorsement.* Portland, April 25-26. Exec. Sec., Miss L. M. Conlee, 608 Failing Bldg., Portland 4.

PENNSYLVANIA: Philadelphia and Pittsburgh, July. Acting Sec., Bureau of Professional Licensing, Department of Public Instruction, Mrs. M. G. Steiner, 351 Education Bldg., Harrisburg.

RHODE ISLAND: * Providence, April 3-4. Chief, Division of Examiners, Mr. Thomas B. Casey, 366 State Office Bldg., Providence.

SOUTH CAROLINA: Columbia, June 23-25. Sec., Dr. N. B. Heyward, 1329 Blanding St., Columbia.

SOUTH DAKOTA: * Pierre, July 15-16. Sec., Medical Licensure, State Board of Health, Dr. Gilbert Cottam, Capitol Bldg., Pierre.

TENNESSEE: * *Examination.* Memphis, March 26-27. Sec., Dr. H. W. Qualls, 130 Madison Ave., Memphis 3.

WEST VIRGINIA: *Charleston, March 31-April 2. Commissioner, Public* Health Council, Dr. N. H. Dyer, State Capitol, Charleston 5.

---

* Basic Science Certificate required

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

ARIZONA: June 17. Sec., Mr. Francis A. Roy, Science Hall, University *of Arizona,* Tucson.

ARKANSAS: Little Rock, May 7. Sec., Mr. L. E. Gebauer, 701 Main Street, Little Rock.

COLORADO: Denver, June 4-5. Sec., Dr. Esther B. Starks, 1459 Ogden Street, Denver.

DISTRICT OF COLUMBIA: Washington, April 21-22. Sec., Commission on Licensure, Dr. G. C. Ruhland, 6150 E. Municipal Bldg., Washington 1.

FLORIDA: May 31. Final date for filing application is May 16. Sec., Dr. M. W. Emmel, University of Florida, Gainesville.

IOWA: Des Moines, April 8. Sec., Dr. Ben H. Peterson, Coe College, Cedar Rapids.

MICHIGAN: Ann Arbor and Detroit, May 9-10. Sec., Miss Eloise Lebeau, 101 N. Walnut St., Lansing.

MINNESOTA: Minneapolis, April 1-2. Sec., Dr. Raymond N. Bieter, 105 Millard Hall, University of Minnesota, Minneapolis 14.

NEBRASKA: Omaha, May 6-7. Dir., Bureau of Examining Boards, State Department of Health, Mr. O. F. Humble, 1009 State Capitol Bldg., Lincoln 9.

OREGON: June 7. Sec., Mr. C. D. Byrne, University of Oregon, Eugene.

SOUTH DAKOTA: Vermillion, June 6-7. Sec., Dr. G. M. Evans, Yankton.

TENNESSEE: Memphis & Nashville, March 24-25. Sec., Dr. O. W. Hyman, 874 Union Ave., Memphis.

WISCONSIN: Madison, April 12. Sec., Dr. William H. Barber, Scott & Watson Sts., Ripon.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Charitable Hospitals: Liability for Employment of Unlicensed Dentists.—The plaintiff sued for damages alleged to have been caused by the negligence of the defendant hospital in hiring an unlicensed dentist in its dental clinic. From a verdict and judgment for the plaintiff, the defendant appealed to the Supreme Court of Errors of Connecticut.

The plaintiff went to the defendant's dental clinic for treatment of a toothache and swollen jaw and was examined by Keller, a substitute dental intern employed by the defendant. The examination, and x-rays taken in connection with it, revealed a decayed and infected wisdom tooth on the left side of the plaintiff's upper jaw. Four days later this tooth was extracted by Keller, following which extraction the plaintiff suffered a fracture of the alveolar process and a postoperative abscess which necessitated nine days' hospitalization.

The defendant hospital, said the court, is a public institution which maintains a dental clinic under the direction of a Dr. Anderson. Keller, not yet a graduate dentist, had attended Tufts Dental College for a period of three and two-thirds years and had been hired as a substitute dental intern on the recommendation of Dr. Anderson and the college faculty. He was not yet licensed to practice dentistry in Connecticut and there was no evidence that he was registered to practice in a clinic in accordance with the Connecticut statutes. The plaintiff contended that the defendant was negligent in the selection of Keller and that this negligence, plus that of Keller, caused the plaintiff's injuries.

The Connecticut statutes, said the Supreme Court, make it illegal for any person or corporation to employ an unlicensed dentist. When the legislature establishes a rule of conduct by statute, and its purpose in doing so is to protect others from injury, a violation of that rule of conduct constitutes negligence. Accordingly the court held that the defendant was guilty of corporate negligence in employing Keller.

Continuing, the court said that the general rule is that an employer is liable for the acts of an employee done in the course of his employment. In Connecticut, hospitals and other eleemosynary corporations are exempted from this rule when they have used due care in the selection of their employees. When, however, they fail to use due care in the selection of their employees, this exemption is no longer effective and the applicable principles of liability are those governing the ordinary relationship of master and servant. An essential element in such liability is the negligence of the employee. If the employee has not been negligent the employer is not liable. The court thus pointed out that principles governing malpractice are determinative of the question of Keller's negligence, the rule in this state being that no recovery may ordinarily be had in such cases unless expert testimony supporting the plaintiff's allegation of negligence somewhere appears. There is no such testimony in this case. On the contrary, the court concluded, all of the medical testimony was to the effect that the operation of the defendant's clinic in general and the treatment by Keller in particular were in accordance with standard practice or even better. The fact that the operation was followed by infection raises no presumption of want of proper care or skill. Since there was no evidence from which the jury reasonably could have concluded that Keller was negligent, the judgment was reversed and the cause remanded with directions to grant the defendant's motion to set aside the verdict.—*Haliburton v. General Hosp. Soc. of Connecticut, 48 A. (2d) 261 (Conn., 1946).*

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1937 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied with stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

American Heart Journal, St. Louis

32:679-832 (Dec.) 1946

*Esophageal Electrocardiogram in Arrhythmias and Tachycardias. S. Butterworth and C. A. Poindexter.—p. 681.
Anoxemia and Exercise Test in Diagnosis of Coronary Disease. G. Biörck.—p. 689.
Plasma Concentrations of Quinidine, with Particular Reference to Therapeutically Effective Levels in 2 Cases of Paroxysmal Nodal Tachycardia. A. F. Delevett and C. A. Poindexter.—p. 697.
Effects of Ingestion of Large Amounts of Sodium Chloride on Arterial and Venous Pressures of Normal Subjects. H. Grant and F. Reischsman.—p. 704.
Electrocardiographic Patterns in Penetrating Wounds of Heart. P. H. Noth.—p. 713.
*Clinical Evaluation of Powdered Human Blood Cells in Treatment of Ulcers of Extremities Associated with Vascular Disorders. M. W. Anderson, N. W. Barker and T. H. Seldon.—p. 754.
Studies on Vascularization of Aorta: I. Vascularization of Aorta in Normal Dog. J. G. Schlichter.—p. 770.

Esophageal Electrocardiogram.—It has been the practice of Butterworth and Poindexter to take esophageal electrocardiograms in all cases in which the P waves were not distinctly visible in any of the leads from the surface of the body. Esophageal electrodes may have a single terminal at the tip of the tube or may have several located at intervals near the tip. The technic of introducing the tube is exactly the same as for a stomach tube. The esophageal lead can be paired with any other lead, but the authors commonly use the left leg or preferably the indifferent electrode of Wilson. At the 55 cm. level the tip of the tube is usually in the stomach. A record is taken at this level, and the tube is then withdrawn in increments of 2 or 2.5 cm. to the 30 cm. level, which usually places the tip above the heart. Levels from 55 to 40 cm. are usually in close proximity to the diaphragmatic surface of the heart and accentuate the ventricular potentials, while those from the 40 to the 30 cm. levels usually overlie the auricles and accentuate the auricular potentials. Several electrocardiograms are reproduced, illustrating the value of the esophageal electrocardiogram in accurately diagnosing certain types of arrhythmia and tachycardia.

Powdered Human Blood Cells in Treatment of Ulcers of Extremities.—Anderson and his associates regard the topical application of powdered human blood cells in treating chronic ulcers of the extremities associated with vascular disease as one of several methods of bland and nonirritating local treatment available. In order to evaluate its effect, the authors have reviewed cases at the Mayo Clinic. In approximately one half in which both ischemic ulcers and stasis ulcers were treated with the powdered blood cells, healing was much accelerated. In the other half in which powdered blood cells were used, it is questionable whether healing occurred any more rapidly than it would have with other bland local applications. In a few cases less healing occurred or the treatment was not well tolerated. It is difficult to determine whether the favorable response occurs from partial desiccation, from some healing factor in the cells, from nutrition supplied by the crust or merely because the crust is protective and entirely nonirritating. Nevertheless it is encouraging to observe progress in the ulcers, with first a puckering of the surrounding skin, then a freshening and reddening of the gray, avascular base, and finally granulations with epithelium creeping in from the margins. Certain disadvantages of wet dressings, such as maceration of the skin and chilling, are avoided with this "dry" method of treatment.

American Journal of Clinical Pathology, Baltimore

16:737-808 (Dec.) 1946

Nutritional Aspects of Certain Endocrine Disturbances. G. R. Biskind and M. S. Biskind.—p. 737.
Further Notes on Pathology of Acute Epidemic Hepatitis and Homologous Serum Jaundice. D. A. Wood and M. B. Black.—p. 746.
*Pathogenesis of Acute Appendicitis. M. G. Bohrod.—p. 752.
*Pathogenesis of Erythroblastosis Fetalis: Statistical Evidence. A. S. Wiener.—p. 761.
False Positive Kahn Reactions: Loss of Titer on Storage of Serum in Ice Box. J. M. Lubitz.—p. 768.
Rare Malignant Tumors in Children. P. H. Hartz and A. van der Sar.—p. 776.
Periarteritis Nodosa in Granuloma of Unknown Etiology: Report of 2 Cases. T. Weinberg.—p. 784.
Large Hemangioma of Liver Successfully Removed Surgically: Report of Case. A. R. Peale and J. N. Coombs.—p. 792.
Large Ventricular Tumor of Ependymal Origin. P. A. Van Pernis.—p. 796.

Pathogenesis of Acute Appendicitis.—Bohrod shows that the two most generally accepted theories attempting to explain the genesis of acute appendicitis can be subsumed in one if it is postulated that (1) the attack of acute appendicitis follows obstruction of the appendix and (2) the most common cause of the obstruction is the lymphoid tissue of the appendix, a labile structure susceptible of rapid change under stimulation. The lymphoid tissue reaches its maximum development in the first decade of life. This tissue is better developed in the male than in the female. The muscularis does not develop fully until the second decade, and it is only at this time that the lumen becomes small. The relationship between the amount of lymphoid tissue and the size of the lumen represents the ability of the lymphoid structure to obstruct the lumen. This relationship correlates well with the characteristic age and sex distribution of acute appendicitis. The lymphoid tissue is susceptible of rapid response to internal stimuli and to environmental factors. This makes understandable the geographic distribution of acute appendicitis, the relationship of this disease to distant infections and the increase of its incidence in periods of climatic variabilty. Whatever the mechanism of its swelling, the lymphoid tissue causes appendicitis by obstructing the lumen of the appendix. Obstructions of the appendical lumen other than those due due to swollen lymphoid tissue are adequate causes of acute appendicitis but do not explain the greatest number of cases of this common disease.

Pathogenesis of Erythroblastosis Fetalis.—Wiener analyzed 97 families with erythroblastotic infants and fetuses from the standpoint of the quality of the Rh antibodies in the maternal serum and the nature of the clinical manifestations in the infants and fetuses. In 25 families, in which the maternal serum contained bivalent antibodies (agglutinins), 8 per cent of the fetuses or infants were stillborn, 28 per cent had congenital hemolytic anemia and 64 per cent had icterus gravis. In 57 families, in which the maternal serum contained univalent antibodies (blockers or glutinins), 43.9 per cent of the fetuses or infants were stillborn, 42.1 per cent had congenital hemolytic anemia and 14 per cent had icterus gravis. This confirms the author's theory of pathogenesis of erythroblastosis fetalis, under which potent univalent Rh antibodies would be expected to cause stillbirths, while potent bivalent Rh antibodies should give rise to icterus gravis. Congenital hemolytic anemia appears to be a milder manifestation of erythroblastosis and occurs when the maternal antibody titer is low in cases both with univalent and with bivalent antibodies. In 15 families, in which the maternal serum contained a mixture of univalent and bivalent Rh antibodies, the syndromes in erythroblastotic infants and fetuses were similar to those encountered in families with univalent antibodies alone. This confirms the hypothesis that univalent antibodies traverse the placenta more readily during pregnancy than do bivalent antibodies, so that the former take precedence over the latter when the two are present together in the maternal serum.

Penicillin in Congenital Syphilis.—Platou and his associates find that 122 additional cases of manifest congenital syphilis in children under 2 years of age have been treated by the university groups at New Orleans, Philadelphia, Baltimore and Galveston. This brings the total number now suitable for analysis to 191. Penicillin appears to be the best agent for the treatment of infantile congenital syphilis. The total dosages employed have varied from 20,000 up to 150,000 units per kilogram of body weight. It is recommended that dosage schedules in excess of 40,000 units per kilogram be used and that treatment continue for sixty or more equal intramuscular injections given at three hour intervals. Schedules comprising 80,000 or more units per kilogram, divided into 120 equal intramuscular injections given every three hours night and day for a period of fifteen days, have not yet been evaluated. Reactions to therapy have appeared unimportant. Only a relatively small number of infants will demonstrate seronegativity during or soon after a single course of penicillin. The number of patients becoming seronegative increases with each month of observation for at least eighteen months. Periodic examinations are necessary to recognize the small number of serologic and clinical relapses which will require additional therapy. Deaths among these infants do not appear to be related to the use of penicillin.

Subclinical Poliomyelitis.—Casey and his associates say that in a study of poliomyelitis carried out in Chicago in the summer and fall of 1945 daily temperature determinations were made on a number of the most intimate child contacts of patients with poliomyelitis. As a control similar studies were made on noncontacts living in the same block as the patient and on control children of the same age living ten and fifty blocks distant. By this procedure many fevers were detected in children who had no complaints of illness. As many of these as could be persuaded were checked several weeks later by examination of the spinal fluid. This paper reports the incidence and clinical features of illnesses observed among these contact, noncontact and control children. The evidence, although scanty, is sufficient to indicate that perhaps 98 per cent of poliomyelitis is a mild, widespread, highly communicable disease of young children leaving no residual paralysis. Transient paralysis occurs in about 5 per cent of all cases and the meningitic form (nonparalytic but with stiff neck or stiff back, head drop and increased cells and protein in the spinal fluid in the first week) in about 14 per cent. The fatality rate seems not to exceed 0.7 per cent. Residual paralysis in poliomyelitis seems an infrequent complication, and perhaps not more than 1 child in 40 or 50 is so affected.

Anomalous Origin of Left Coronary Artery.—The histories of 2 infants with anomalous origin of the coronary arteries recorded by Lyon and his co-workers bring the total number of reported cases to 20. In both cases enlargement of the heart, persistent symptoms of respiratory distress and the inversion of the T waves in the first lead or in all leads of the electrocardiogram permitted a tentative clinical diagnosis of the nature of the cardiac disorder. Important abnormalities found, other than the origin of the left coronary artery from the pulmonary artery, were limited to the left ventricle, where there were endocardial fibrosis, degenerative changes of the myocardium with replacement by fibrous tissue, infarcts in the myocardium and in 1 case persistence of embryonic sinusoids.

Di-Isopropyl-Fluorophosphate in Myasthenia Gravis.—According to Comroe and his associates di-isopropyl-fluorophosphate (DFP) is a compound which, although completely unrelated chemically to neostigmine, has been shown to produce inhibition of cholinesterase in serum, red cells, muscle and brain. The rates of restoration of these activities are slow following its administration and consequently its effects are far more prolonged than those of neostigmine or physostigmine. It was used in treating 7 patients with myasthenia gravis. Some patients were benefited, but in no case did the objective or subjective improvement following its use equal or exceed that produced by neostigmine. Attempts to give larger doses of the compound resulted in nausea and vomiting and symptoms referable to the central nervous system. Despite the fact that it lowered plasma cholinesterase to zero, it produced less improvement than did neostigmine. The potentialities of a drug for treating myasthenia gravis cannot be gaged by its effect on plasma cholinesterase. The compound may be utilized in nontoxic doses to obtain its prolonged effect at the same time that neostigmine is used to obtain its characteristically stronger action.

Clinical and Roentgenologic Aspects of Coccidioidomycosis.—Sweigert and his associates report 77 cases of coccidioidomycosis treated in a hospital and a study of clinical and roentgenographic material on approximately 200 additional patients observed in southern Arizona between August 1941 and August 1945. The fact that coccidioidomycotic cavities and nodules may persist for many months or several years must be taken into consideration in contemplated mass surveys of the chest. Three case histories illustrating different clinical patterns of disseminated coccidioidomycosis, 1 with apparent recovery from coccidioidal meningitis, are reported.

Penicillin in Pyogenic Dermatoses.—Hopkins and Lawrence made observations on 618 soldiers, of whom 211 were treated in a hospital and 407 in a dispensary. Local penicillin therapy was rapidly effective in the majority of cases of impetigo, ecthyma and the pyogenic complications of dermatophytosis. Intramuscular penicillin was effective in furunculosis and hidrosadenitis. One third of the cases of folliculitis of the beard cleared at least temporarily under penicillin. Concentrated local applications combined with intramuscular injections often appeared necessary. Secondary infections in eczematous dermatitis were controlled in 40 per cent of cases, but sensitization developed frequently after local therapy. Penicillin was seldom effective in seborrheic dermatitis, intertrigo, folliculitis of the trunk or extremities or acne.

Hereditary Nystagmus.—According to Rucker, hereditary nystagmus appears as a constant, horizontal, to and fro movement of the eyes, pendular in type, or small excursion on forward gaze and coarser on looking to the sides. Nystagmus is said to be inherited in any one of several different ways—as a mendelian dominant or recessive character or as a sex linked character. The propositus of the family reviewed in this report was a 7 year old boy whose father brought him to the clinic to have an operation performed on his eyes to steady them. The family had 231 members in six generations. The 21 members who had nystagmus were males, and all inherited it through females who themselves were not affected. In a number of instances the gene passed through a chain of several females before it became evident in a male descendant. In no case has a male transmitted the defect to his son. All descendants of nonaffected males are free from the defect. In this family the character is sex linked and without exception has been recessive in the females.

Ionization Measurements with Bone Chambers.—Stenstrom and Marvin made measurements with ionization chambers constructed of bone in order to obtain some information on the total ionization in bone in connection with roentgen therapy. Maximum values of over 400 per cent (bone compared to lucite) were observed for 100 kilovolts (peak) with a half value layer of 0.3 mm. of copper, and of about 380 per cent for 140 kilovolt peak with a half value layer of 0.35 mm. of copper. Values were lower for higher voltages and greater filtration. Measurements taken with a water phantom indicated a greater amount of ionization in bone (up to 5 cm. depth in the phantom) when 140 kilovolt peak was used, than was observed at any other voltage. This may have direct application in therapy as 140 kilovolt peak may be preferred when ionization in bone is desirable and used with caution when bone damage is to be avoided.

Neurologic Manifestations in Infectious Hepatitis.—Weinstein and Davison describe 4 cases of infectious hepatitis with manifestations of severe involvement of the nervous system in the preicteric phase of the disease. Headache, rigidity of the neck, increase in the number of cells in the spinal fluid, pain in the eyes, photophobia, blurred vision, numbness of a hand, lethargy, positive Kernig's signs, hypoactive deep tendon reflexes, absence of the superficial ones and a paralyzed bladder were the symptoms presented by these patients. If the attacks occur during the time of the year when poliomyelitis is prevalent, as did the ones reported in this paper, a diagnosis of acute anterior poliomyelitis may be made. A history of contact with a case of infectious hepatitis may be very helpful in suggesting this disease as the cause for the neurologic signs and symptoms. In cases of so-called nonicteric infectious hepatitis the etiology of the neurologic signs may be completely overlooked unless chemical studies of the blood and urine are carried out.

Broncholithiasis. D. W. Zahn.—p. 418.

Pathogenesis of Pleurisy with Effusion.—Thompson reviews observations on 190 cases of simple pleurisy with effusion. There was a high incidence of preceding or concurrent intrathoracic lesions typical of primary tuberculosis, confirmed sometimes by the later development of calcification. Cavity formation occurred in 5 cases presenting these lesions. The lesions were glandular or parenchymal; they were not always on the same side as the effusion. The incidence both of primary type lesions and of pleural effusion was higher on the right side than on the left. Pleurisy with effusion was found predominantly in the years of late adolescence and young adult life. There was an excess of males over females confined to the 15 to 19 year group. The follow-up revealed subsequent tuberculosis in 12 per cent of the total number of patients within the first year, in 8 per cent of the remainder within the second year and in a total of 25 per cent within five years. No case occurred after five years. In 15 per cent of these cases the first evidence of disease was extrapulmonary. The death rate for the 190 patients over the five year period was 3.5 per cent.

Results of Artificial Pneumothorax and Pneumonolysis.—Branday presents observations on 100 patients who were treated by artificial pneumothorax and in whom section of adhesions was required in order to effect efficient collapse. All were ambulant during the greater part of treatment; few stayed in the hospital more than a few days or weeks of operation, and nearly all continued to work. Nearly all were in poor economic circumstances, quite unable to obtain extra nourishment and rest. Individual resistance appeared to be a most important factor in favorable progress and to depend on the economic position of the patient. Efficiency of collapse appeared to be the factor in treatment which exerted the most decided influence on the outcome of the case. Treatment of this group of patients appears to have been worth while in spite of the unfavorable type of disease and inability of patients to cease work on account of their economic circumstances. In 22 of the 39 patients who died up to December 1945 the operation had been technically efficient; they died as a result of extension of disease, caused by persistently patent cavities, or of toxemia due to empyema, which was caused by a spontaneous pneumothorax in 4 cases.

Diet and Tuberculosis in Captive Wild Birds.—Ratcliffe shows that a change in the system of feeding at the Philadelphia Zoological Garden has been followed by a distinct decrease in the frequency of avian tuberculosis. With the exception of a mixed lot of birds in an indoor flight cage, the disease has been most common among groups of birds whose food had consisted chiefly of whole or cracked grains. In the new diet grain has been replaced by a mixed ration. This has improved the quality and quantity of protein, has increased elements of the vitamin B complex and has added vitamins A and D and iodized salt to the diets. In some groups the drop in tuberculosis could have resulted from decreases in the number of imported infections. In other groups, however, all evidence suggests that resistance has been increased by improved nutrition.

Syphilis: Review of Recent Literature. F. W. Reynolds and J. E. Moore.—p. 733.

Latent Phase of Asiatic Schistosomiasis.—The study by Mason and his associates is based on observations of 300 patients admitted to Harmon General Hospital approximately six months after the onset of their acute illness overseas. Although the majority had residual complaints, such as abdominal discomfort, weakness, headaches, myalgia and nervousness, their general physical condition was excellent. In spite of previous treatment overseas, approximately one third of the patients had the ova of Schistosoma japonicum in their stools when the initial evaluation of their status was made at Harmon General Hospital. Treatment with antimony and potassium tartrate and fuadin containing equivalent amounts of trivalent antimony (0.58 Gm.) resulted in the disappearance of ova from the stools in 81 and 18 per cent of the patients respectively. Since no major toxic effects were encountered with antimony and potassium tartrate in the concentration employed, it is the drug of choice. Evidence indicates that 444 cc. of a 0.5 per cent solution of antimony and potassium tartrate, U. S. P., is the most effective therapy. This is given intravenously on alternate days, beginning with 8 cc. and increasing the dose 4 cc. with each dose until a maximal dose of 28 cc. is given. The dose of 28 cc. is repeated every other day until 444 cc. (2.2 Gm.) of antimony and potassium tartrate has been received.

Nephropathies in Early Syphilis.—Thomas and Schur state that 12, or less than 0.3 per cent of those treated for secondary syphilis, showed greatly abnormal urinary findings which responded rapidly and dramatically to intensive, rapid treatment for syphilis. Ten of the 12 were classified as syphilitic nephrosis and 2 as nephritis. In syphilitic nephrosis results of tests of renal function are not significantly abnormal as a rule, but albuminuria and cylindruria are present. In early syphilitic nephritis there is less albuminuria than in nephrosis and more hematuria. In 1 case of diffuse glomerulonephritis apparently due to secondary syphilis, in which there was hypertension and secondary anemia, there was response to antisyphilitic treatment with penicillin. Early syphilitic nephropathies leave no demonstrable sequelae.

Association of Pneumonia with Erythema Multiforme Exudativum.—The report by Dingle and his associates of the Commission on Acute Respiratory Diseases deals with 6 cases of erythema multiforme exudativum with predominant involvement of the mucous membranes of the mouth, seen at the Regional Station Hospital at Fort Bragg, North Carolina. In 3 of the cases clinical and roentgenographic evidence of pulmonary involvement was demonstrated. The report emphasizes the relationship of pneumonia to erythema multiforme exudativum. The latter has been regarded as a specific infectious disease, possibly of virus causation. Bacteriologic studies in this, as in other studies, failed to yield results, except that in 1 case bacteriologic and serologic evidence of beta hemolytic streptococcus infection was secured. While it is improbable that this organism represents the usual cause of erythema multiforme exudativum, it is possible that it may be one of the causes. The studies carried out in animals and embryonated eggs were probably adequate to rule out the presence of the virus of herpes simplex, vesicular stomatitis and members of the psittacosis-meningopneumonitis group. No etiologic agent was found. These studies neither rule out nor support a possible virus causation for cases of erythema multiforme exudativum. A report in the *Canadian Medical Association Journal* (**53:**427 [Nov.] 1945) on "Mucosal Respiratory Syndrome" states that nonbacterial pneumonia was observed in 14 of 17 cases presenting the severe form of erythema multiforme exudativum. The authors conclude that pneumonia was an integral feature of the syndrome and that its cause was not bacterial and was probably viral. Attempts to isolate an agent from the lung in the fatal case reported here were carried out on horses, cows, sheep, pigs and guinea pigs. Lesions were not produced in any of the animals.

*Burns of Upper Respiratory Tract and Eyes from Nitrogen-Mustard Gas (1149): Clinical Study. G. I. Uhde.—p. 701.

Contributions to Plastic Surgery During 1945. L. A. Peer.—p. 715.

Penicillin in Peritonsillar Abscess.—The studies reported by Rosenberg were carried out by army doctors in Germany on military personnel between the ages of 21 and 41. Twenty-five cases of peritonsillar abscess and peritonsillar phlegmon were studied. Ten doses of penicillin, 20,000 Oxford units each, were given intramuscularly every three hours. Five patients required incision and drainage; in 2 patients the abscess ruptured spontaneously; in the remainder the acute inflammatory process subsided under treatment with penicillin. The therapeutic results obtained with penicillin in peritonsillar phlegmon are superior to those obtained with sulfonamides. If used early, penicillin may avert abscess formation and subsequent incision and drainage.

Burns from Nitrogen Mustard Gas (1149).—Uhde collected information on 8 casualties resulting during the developmental operation of a pilot plant for nitrogen mustard (1149) at Edgewood Arsenal, Md. This is a relatively unknown gas developed during World War II. Representative case histories of a vapor and of liquid burn are presented. The commonest complaint pertaining to the upper respiratory tract was hoarseness, and the commonest lesion was diffuse inflammation, frequently spotted with necrotic ulcers of grayish slough. It is supposed that these ulcers were due to the necrotizing action of the gas per se, but they may have been the result of bacteria acting on devitalized tissue. There was evidence that the latter surmise was true to a certain extent. The most frequent eye complaint was a burning sensation characterized by conjunctival injection and superficial punctate keratitis. Symptoms of acute esophagitis and gastritis were an interesting observation in that they may have been due to the swallowing of contaminated air. Under the conditions of these accidents the mucosa of the upper respiratory and digestive tracts and the conjunctiva appeared to be equally sensitive to the vapor of this gas.

*Denial of Own Blindness (Anton's Syndrome): Report of 2 Cases, 1 with Autopsy. N. W. Brockman and K. O. Von Hagen.—p. 178.

Cerebellar Subdural Hydroma.—In the case reported by Grant, acute symptoms of right-sided cerebellar disturbance and of high intracranial pressure developed a few days after a head injury. Burr holes over the right cerebellum and right parietal lobe liberated a subdural hydroma in both places. Symptoms subsided within a week, and the patient has made a good recovery.

Use of Hydantal, a New Anticonvulsive Drug, in Epilepsy.—According to Von Hagen a tablet of hydantal contains 0.1 Gm. of 3-methyl 5.5 phenylethylhydantoin in combination with 0.02 Gm. of phenobarbital. He had the opportunity to try this drug in cases in which previous routine methods of treatment did not give symptomatic improvement or in which there developed a sensitivity to the preparation used. Hydantal alone or in combination with one of the barbiturates was given to 20 patients. Of these 9 received beneficial results, 7 reported no relief and 4 failed to return. One patient reported a dull feeling in her head with three tablets daily. Although the number of cases is small and the results are difficult to evaluate exactly, they do seem to indicate that hydantal is an effective anticonvulsant drug which is remarkably free from undesirable side effects.

Denial of Own Blindness (Anton's Syndrome).—The existence of blindness in patients who deny being blind is also known as Anton's syndrome, Gabriel Anton having called attention to this condition by the publication of 4 case reports in 1898 and 1899. Since then other cases have been reported and Brockman and Von Hagen describe 2 cases of this type. In both there were considerable intellectual deterioration, impairment of memory, disorientation, confabulation and complete blindness apparently due to bilateral involvement of the occipital lobes or the optic radiations. This was shown by necropsy in case 1. Brockman and Von Hagen have no explanation for the apparent relationship between the blindness and deafness noted in case 2. The pathogenesis of denial of blindness is not clearly understood, since in a few cases the blindness has been due to pathologic change in the retinas or in the optic nerves. In general it would appear that the condition is due to a disturbance in the to and fro circuits between the thalamus and the occipital cortex.

Tropical Acne.—According to Novy the term "tropical acne" arose during the war to describe those cases of acne vulgaris which were seen so frequently in the military personnel serving in the hot climates. These cases accounted for 28.5 per cent of the dermatologic cases sent home from overseas. It was seen mostly in those having suffered from previous, usually mild, acne vulgaris. It differs from acne vulgaris of the temperate zones in its rapid development, and it is of a deep cystic, indurated type which leaves mutilating scarring. Tropical acne is seen most frequently on the back, shoulders and neck, whereas the usual acne vulgaris most commonly involves the face. Excessive heat which overstimulates the sebaceous glands appears to be the chief factor in the development of tropical acne. The recent war has shown that those with acne vulgaris should not be sent to the tropics because, with many, the disease is aggravated and severe scarring results.

BCG Vaccination in Hospitals and Sanatoriums.—Ferguson says that when the breakdown of persons caring for the tuberculous sick became particularly noticeable in Saskatchewan in the early thirties it was decided to introduce periodic tuberculin testing and x-raying of nurses and employees in the larger hospitals and sanatoriums. After five years of study it was evident that by far the highest incidence of tuberculosis occurred among exposed persons who had been negative to tuberculin on entering the infectious environments. A coincidental experiment in the protection of Indian infants by BCG vaccination suggested that an attempt be made to afford a similar protection to unavoidably exposed nurses and sanatorium employees by means of BCG vaccination. BCG vaccination of nurses negative to tuberculin on entrance reduced the number of cases of manifest tuberculosis among this group to a fourth, and among sanatorium employees the results were even more favorable. Thus, although BCG is not a 100 per cent effective prophylactic, its protection is very considerable. In the vaccinated group the lesions were less extensive than in the nonvaccinated.

Intrauterine Use of Sulfanilamide.—Sadovsky and his co-workers studied the effect of sulfanilamide during and after intrauterine intervention in 77 cases. The local bacteriostatic action due to high local concentration has been studied by cultures taken from the uterus before and after the application of sulfanilamide in 14 cases; in 11 cases the bacteriostatic effect could be demonstrated. It has been observed that sulfanilamide, when applied into the uterine cavity, reaches its maximal blood level three to six hours after the application, and it may be found in the blood stream even after twenty-four hours. This has been observed to occur in the uterus at term after removal of the placenta and in the early months of pregnancy after removal of placental rests as well as after diagnostic curettement. The absorbability of a pregnant uterine wall is better than that of a nonpregnant uterus, and it is especially high in the uterus at term. Sulfanilamide is absorbed better through the uterine wall than from a surgically produced wound. Absorption from the uterus also compares favorably with absorption after oral administration. In 50 patients with various clinical conditions the prophylactic use of sulfanilamide proved to be of special value in manual removal of the placenta, in cesarean section and in hysterotomy for submucous myoma, while it was used also as a therapeutic measure in cases of septic abortion and chronic endometritis.

Laboratory Aids in Infectious Hepatitis.—Neefe and Reinhold applied a group of hepatic tests at frequent intervals to 34 volunteers before, during and after infectious (epidemic) hepatitis induced by oral or parenteral inoculation with materials containing a virus that had been responsible for an epidemic in a Pennsylvania summer camp. Tests that were among the most prompt and consistent indicators of the initial hepatic disturbance often were of little value in detecting persistent hepatic disturbance in the convalescent stage of the disease. In early (preicteric) infectious hepatitis the sulfobromophthalein, Harrison spot (urine bilirubin), cephalin cholesterol flocculation, 1′ serum bilirubin and thymol flocculation tests, becoming positive in the order named, were found to provide the earliest evidence of hepatic disturbance. The methylene blue (urine bilirubin), total serum bilirubin, colloidal gold, urine urobilinogen, thymol turbidity and qualitative van den Bergh tests responded either later or less consistently in early hepatitis. During the convalescent stage the thymol (flocculation and turbidity) test was found to be the most consistent indicator of persistent disturbance with the colloidal gold, cephalin cholesterol flocculation, 1′ serum bilirubin and sulfobromophthalein tests following in order of decreasing consistency. The total serum bilirubin, urine urobilinogen and urine bilirubin tests frequently gave normal results in spite of persistent hepatic disturbance revealed by the other procedures. Considerable variation in the response to these tests was noted in individual cases. Because of the variability of response with the stage of the disease and with individual patients, the routine use of a group of tests is essential for the detection of mild hepatic disturbance at any stage of the disease. A group composed of the sulfobromophthalein, total and 1′ serum bilirubin, urine bilirubin and urobilinogen, cephalin cholesterol flocculation and thymol (turbidity and flocculation) procedures appears to constitute the most reliable group of tests for this purpose.

Postoperative Biliary Dyskinesia.—Colp discusses the treatment of biliary dyskinesia and presents reports on 8 patients in whom an endocholedochal sphincterotomy had been performed. Six have shown improvement and have been relieved of their troublesome symptoms. One patient has had occasional slight epigastric distress during her menstrual period, while another has had recurrence of colic after nineteen months of absolute freedom from attacks. Surgical section of the sphincter usually causes permanent paralysis. Because of a recurrence of symptoms in 1 patient it may be advisable in the future to divide the sphincter in two separate planes. Evidently the scar resulting from the sphincterotomy has never caused a secondary contraction of the papilla resulting in stenosis and biliary stasis.

Amino Acid Alimentation.—Remington and his associates say that for ten years intermittently preparations of amino acids have been used at the Mayo Clinic. They have been administered in the form of digests of various proteins parenterally and orally in several intestinal diseases, such as ulcerative colitis, regional enteritis, enterocutaneous fistula and ileal stoma, gastrojejunocolic fistula, sprue and pancreatic insufficiency. Oral administration has been shown to be preferable as far as utilization of nitrogen is concerned. Some patients can drink 250 cc. of 20 per cent solutions of amino acids such as parenamine or amigen several times a day. However, the taste is not pleasant and few can do this. Palatable products are being perfected and comparative nitrogen balance studies are being carried out. Too rapid intravenous administration of most of the available protein digests will cause nausea and vomiting. In order to prevent these effects at least three hours should be taken to administer each liter. The authors conclude that amino acids administered orally or parenterally are nutritionally beneficial as a protein substitute when sufficient food cannot be ingested or absorbed.

Superior Sulcus Pulmonary Tumor (Pancoast Syndrome).—An accountant aged 56 had had pain in the shoulder for about a year. One month prior to consultation he had been obliged to give up his work on account of inability to write. He had lost 20 pounds (9 Kg.). Examination showed barely perceptible fulness above the right clavicle and indefinite dulness on percussion above and below the clavicle. The right pupil was about twice the diameter of the left. The sputum was negative for tubercle bacilli. A diagnosis of malignant tumor of the Pancoast type was made. Removal of the tumor was impossible. A biopsy specimen showed that the tumor was a bronchiogenic carcinoma of the squamous cell type. Death occurred fourteen days after the operation. Walker stresses that a superior sulcus pulmonary tumor (Pancoast syndrome) is characterized by intractable shoulder girdle pain, by an x-ray opacity at the pulmonary apex and frequently by Horner's syndrome and rib erosion. Of these, the most important features are the pain and the x-ray opacity.

Is Endemic Goiter Due to Lack of Iodine?—The hypothesis that lack of iodine is an important factor in endemic goiter has been subjected by Greenwald to a critical examination. He stresses that the evidence that there is a deficiency in the iodine intake in goitrous regions is faulty in that the proponents of this view have not properly controlled their analytical technic. Different varieties of the same vegetables, grown on the same soil and at the same time, show a greater variation in their iodine contents than the differences claimed to exist between foods produced in goitrous and nongoitrous areas. A negative correlation between the weights of the thyroids and their iodine contents could not be demonstrated in any one of twenty-three series of analyses by seventeen different observers. Such correlation as has been found to exist is positive, the larger glands tending to contain the larger amounts of iodine. Persons with goiter do not show a low metabolic rate, the usual sign of thyroid insufficiency. Goiters have been produced in rats on certain iodine poor diets, but the addition of such small quantities of iodine as are found in ordinary diets has not prevented the enlargement of the thyroids. Glands of normal size and microscopic appearance have been obtained in rats on such diets only by the use of much larger amounts of iodine. The prophylactic administration of iodine to human beings has not reduced the incidence of new goiters to zero. In fact, in some cases there has been an increase in the incidence. Greenwald concludes that endemic goiter is not due to a lack of iodine.

Extreme Insulin Resistance.—A man with mild diabetes had three distinct episodes of extreme insulin resistance, each of which was associated with local and general allergic reactions to insulin. During the third and last refractory period reagins were found in the blood. There was no evidence of any antibodies in the circulation having a direct anti-insulin effect. McGavack and his associates feel that the fact that the patient had a cirrhotic liver during the entire period and a retention cyst of the pancreas in the last attack points to a possible hepatopancreatic abnormality as an additional factor in producing and maintaining the insulin resistant state.

Psychosurgery for Relief of Unbearable Pain.—Among the 360 patients with nervous and mental disease on whom Watts and Freeman performed lobotomies there were some whose complaints of pain appeared excessive. Following lobotomy not only was there a disappearance of the anxiety, apprehension and nervous tension but the unceasing complaints of pain were no longer heard. This led the authors to employ psychosurgery for the relief of unbearable pain. Six of the 9 patients presented had mental disorders. All of these complained of severe, unbearable pain. Three of the 6 had demonstrable organic disease but the complaints were out of proportion to the condition. The other 3 had no organic disease. The authors also present 3 patients with severe pain due to radiculitis, carcinoma of the rectum and tabes dorsalis. They conclude that when unbearable pain is one of several symptoms in a mental disorder the complaints of pain disappear along with the nervous reactions following prefrontal lobotomy. When pain due to organic disease becomes unbearable (the disease itself being incurable) and fear of pain becomes as dreadful as pain itself, prefrontal lobotomy is indicated. Psychosurgery alters the individual's reaction to pain without materially changing his ability to feel pain. Pain may be present but when divorced from its implications—the threat to his security and fear of disability and death—it then becomes bearable and may be accepted with fortitude.

Chromic Catgut vs. Cotton Sutures.—Stevens and his associates made a carefully controlled study of 100 consecutive cases. Only operations for nonrecurrent inguinal hernias and for clean appendixes were included. In 50 cases cotton sutures were used and in 50 fine chromic catgut. The results obtained suggest the clinical superiority of fine chromic catgut over cotton in the closure of clean wounds. Early ambulation is not contingent on the type of suture material used. There was no difference in postoperative pain and temperature following the use of fine chromic and cotton sutures.

Urticaria Associated with Penicillin Therapy.—Callaway and Barefoot report 5 instances of urticaria associated with penicillin therapy in 2 men aged 26 and 44 and in 3 women between the ages of 17 and 42. The patients were studied for hypersensitivity and for circulating antibodies to sodium penicillin by means of intracutaneous tests, passive transfer tests (including the usual Prausnitz-Kuestner reaction, "distant reaction," and reversed passive transfer tests) and precipitin tests. All intracutaneous and passive transfer tests were negative. The precipitin tests were inconclusive. In the immunologic studies on 2 patients the authors were able to use penicillin identical with that which the patients received therapeutically and to which they had reacted clinically. The immunologic studies on these patients were in no way different from those on 3 patients who had received penicillin of which the manufacturer and lot number were unknown. In all instances the urticaria was controlled by benadryl (beta-dimethylaminoethyl benzohydryl ether). It is suggested that an excessive amount of histamine was present to account for the urticaria, but from the studies reported the urticaria cannot be accounted for on the basis of an antigen-antibody reaction.

Recurrent Vesicular Eruption of Hands.—Flood and Perry report 30 instances of vesicular dermatitis of the hands in 28 men between the ages of 21 and 39 years and in 2 women aged 24 and 26. Food allergens were detected by ingestion while 29 patients were on a strict trial diet. The allergen was detected by having 1 patient keep a food diary. Prompt improvement occurred as soon as the offending foods were withheld and definite reactions occurred on ingesting an offending food. The foods most likely to give a reaction are tuna fish, wheat, milk, tomato, pork, pineapple, American cheese, eggs, lamb, chocolate and chicken. The foods less likely to give a reaction are prunes, beef, cabbage, salmon, tea, pears and lemon.

Cutaneous Diphtheria.—Livingood and his co-workers report 140 instances of cutaneous diphtheria among American soldiers in the North Burma campaign during the summer of 1944. Cutaneous diphtheria is essentially a tropical infectious disease. Mud, insects, leeches and constant maceration of the skin due to excessive sweating made it impossible for the soldiers to maintain an intact cutaneous surface. Except for the rare eczematous forms the disease was primarily an ulcerative process on the skin involving the entire epidermis and the underlying subcutaneous tissue. A grayish, yellowish or brownish grey membrane was seen only at an early stage of the disease, while a black or brownish black adherent leathery slough with a dry outer surface was the important single clinical feature in more than 75 per cent of the patients. Healing always started evenly around the periphery of the lesion and proceeded toward the center, so that the central portion was the very last to epithelize. The resulting scars were quite distinctive. In 20 per cent of the cases spontaneous occurrence of a small bulla in some part of the scar was observed which is of considerable diagnostic significance in diphtheritic ulcers. Unhealed ulcerations became hypesthetic or anesthetic three to five weeks after the onset, and these sensory changes are a diagnostic aid of great importance. The most common site of involvement was on the lower extremities. Almost all the patients required at least four months of hospitalization. Neurologic complications occurred in 34 per cent and cardiac complications in 4.5 per cent of 109 relatively unselected patients in this series. The administration of diphtheria antitoxin (standard dosage of 40,000 units) as long as one month after the onset of the lesions resulted in a low incidence of complications and uneventful healing of the ulcerative lesions.

Standardization of Skin Test Reagent for Whooping Cough.—Felton and her associates compared the agglutinogen of phase I Hemophilus pertussis prepared by a method of chemical extraction with the sonic extracted material which has been shown to be a satisfactory skin test agent for susceptibility to pertussis. The acid extracted agglutinogen was standardized against the sonic product and found to be more potent and to give more clearcut reactions. Review of these data showed that a twenty-four hour reading time could be recommended. This agglutinogen gives results identical with those obtained with the sonic extracted material; there is no reaction even in large doses in normal (susceptible) persons and an allergic reaction at the site of injection in any individual with solid immunity to whooping cough from either immunization or previous attack of the disease. In an institution with annual outbreaks of whooping cough the use of agglutinogen before the anticipated epidemic was followed by a significant decrease in the number of cases, all of which occurred in the group predicted by the skin test to be susceptible. Yearly skin testing of new students followed by immunization of all susceptible children has resulted thus far in the absence of whooping cough from this school. The use of agglutinogen has a place as a public health measure in periodic examinations of young children.

Intra-Articular Penicillin in Suppurative Arthritis in Children.—Tucker and Tepper report 4 cases of suppurative arthritis in infants and children in which surgical intervention was not required. Three were in the acute stage of the disease and 1 in the chronic stage, and adjacent osteomyelitis was present in 3. All were treated by joint aspiration and intra-articular instillation of penicillin. Supplemental therapy consisted in intramuscular penicillin in all, oral sulfadiazine in 3, transfusions and physical therapy. Three surviving patients were seen after discharge at three, nine and twelve months respectively, with complete return of function in the last 2 and without recurrence in any. Intra-articular penicillin therapy alone in large dosage may be adequate.

Combined Sulfonamide and Penicillin in Pneumococcic Meningitis in Children.—In studies on 19 infants and children with pneumococcic meningitis treated with sulfadiazine and penicillin Ross and Burke found that penicillin should be administered both intramuscularly and intrathecally to achieve therapeutic spinal fluid penicillin concentrations. The combination with sulfadiazine appears to offer advantages over penicillin alone. Therapy should be continued for at least eight to twelve days after sterilization of the spinal fluid. Type specific antiserum was administered only to the first 7 of the 19 patients receiving combined sulfonamide-penicillin therapy. There were 6 recoveries and 1 death among the 7 receiving antiserum; and there were 10 recoveries and 2 deaths among those who did not receive antiserum. The series is too small to appraise the value of antiserum. The importance of the early institution of therapy in pneumococcic meningitis cannot be overemphasized. If all the measures in present day therapy are brought to bear as quickly and as vigorously as possible, the prognosis, even in the infant age group, is relatively good.

Intravenous Alimentation in Infants.—Dodd and Rapoport report administration to infants by venoclysis of the needed elements of nutrition for periods up to fifteen days. Most of the children had chronic or recurrent diarrhea and vomiting. The aim was to supply adequate fluid and salts and at least maintenance amounts of calories and protein. A total fluid intake of 150 cc., 50 calories and 2 Gm. of protein per kilogram of body weight was elected. The saline value was calculated on the basis of Butler's figures as 80 cc., with an addition of 5 cc. for each kilogram of body weight. In malnourished infants the attempt was made to furnish sufficient protein and calories to produce weight gain. It was shown that maintenance of fluid and electrolyte equilibrium by parenteral fluid administration is possible even in small infants during periods of partial or total withdrawal of oral feeding. With the use of dextrose, whole blood, plasma and casein hydrolysate a gain in weight may be achieved. A daily record of total intake of fluid, saline, calories and nitrogen is an essential prerequisite. Premature and very young infants require less saline in proportion to their body weight than do older infants. Contamination of the casein hydrolysate, infection at the site of needle punctures and thrombosis of the veins present a considerable problem, but by the use of a closed system of administration the more serious difficulties have been almost completely overcome. Thrombophlebitis and wound infection continue to be troublesome.

New Hemostatic Dressings in Anorectal Surgery.—Rosser presents the results of a clinical investigation involving the application of gelatin sponge, oxidized cotton and oxidized gauze to surgical procedures in and about the anal canal. He concludes that these absorbable hemostatic materials apparently satisfy the criteria for desirable postoperative anal dressings. Their effectiveness as hemostatic agents is demonstrated by the absence of primary hemorrhage in 117 anorectal hospital procedures. The materials should be applied as small single dressings to the individual wounds and not inserted as occluding packing.

Congenital Heart Disease Amenable to Surgical Treatment.—The three types of congenital heart disease discussed by Fashena are coarctation of the aorta, patent ductus arteriosus and pulmonary stenosis or pulmonary atresia. The surgical correction of coarctation of the aorta and of pulmonic stenosis is still in the experimental stage, and no predictions can be made concerning the long term results of these operations. All three of the operative procedures require the utmost skill in intrathoracic surgery as well as specialized technics in anesthesia. For these reasons it is desirable that cardiac surgery be confined for the present to large medical centers where the requisite study can be given to these patients and where follow-up data can be accumulated more advantageously.

Melarsen Oxide in Malaria.—Fifty-eight unselected cases of malaria were treated in public clinics with intravenous melarsen oxide. Twenty-five mg. was given daily with the intention of completing a series of seven consecutive injections. Forty of these completed the series of injections. The symptoms subsided on or about the fourth or fifth day of treatment. Upper abdominal tenderness disappeared and enlarged spleens became gradually reduced in size in chronic cases. Five patients either experienced a relapse or acquired a reinfection. Payne and his associates conclude that melarsen oxide will cause remission and possible cure of malarial infection.

Melarsen Oxide (New Arsenical) in Tropical Disease.—Payne and his associates were engaged in maintaining a medical and health program for workers and their families engaged in production of quartz and mica in the states of Minas Gerais and Goyaz, Brazil. There was a complete lack of proper food, housing and sanitation. The health of the population was extremely poor. Malaria was present in pandemic form. Tropical ulcer caused an economic loss second only to malaria. In northern Goyaz, Leishmaniasis incapacitated many for work. Dysentery, both amebic and bacillary, was common. Hookworm was pandemic, and epidemics of typhoid and smallpox roamed throughout the entire region. Refrigeration was not available in this territory, and it was necessary to use drugs unaffected by the deteriorating effects of heat and moisture. Melarsen oxide is a stable trivalent arsenical compound. The drug was given by intravenous injection and was free from toxic reactions. Tropical ulcer was found to respond well to melarsen oxide therapy. Pain and induration subsided rapidly. Healing time decreased by 50 per cent or more. Frambesia in its secondary stage responds rapidly to intravenous melarsen oxide therapy. Results compared favorably with those obtained with mapharsen.

Status of Thiouracil in Treatment of Toxic Goiter. W. O. Thompson, P. K. Thompson and D. M. Mandernach.—p. 50.

Thiouracil in Hyperthyroidism.—Bartels and Bell used thiouracil at the Lahey Clinic in the preoperative preparation of 400 patients with severe hyperthyroidism, 338 of whom had primary hyperthyroidism while 62 had toxic adenomatous goiter. These patients represent about 35 per cent of those having thyroidectomy for hyperthyroidism during the last three years. One hundred and fifty-seven patients (39 per cent) were over 50 years of age and 53 (12 per cent) were over 60; 150 patients (37 per cent) had hyperthyroidism of over two years' duration; 211 patients (52 per cent) had lost more than 20 pounds (9 Kg.) and 40 (10 per cent) had lost more than 50 pounds (22.7 Kg.); 209 patients (52 per cent) had initial basal metabolic rates greater than +50. Thiouracil was administered in a daily dose of 0.6 Gm. given in three fractional doses of 0.2 Gm. This daily dose was continued during the entire time of treatment. Patients with primary hyperthyroidism of less than six months' duration who have not received iodine respond more readily and patients with adenomatous goiter having received previous iodine respond very slowly; consequently the duration of thiouracil treatment must be individualized. Only 35 among the 400 patients developed a reaction during thiouracil administration. Irrespective of the type and the severity of hyperthyroidism or degree of physical depletion, patients adequately treated with thiouracil were actually restored to a normal state of health before thyroidectomy was done. Experience indicates that subtotal thyroidectomy can be done with greatly reduced risk and hyperthyroid reactions during anesthesia and after operation can be eliminated completely. There was one postoperative death and one death from agranulocytosis due to thiouracil, a mortality of 0.5 per cent.

Miller-Abbott Tube in Treatment of Ileus. N. R. Wyndham.—p. 62.

Surgical Hazards in Cholecystitis and Cholelithiasis.—Muir says that when surgical treatment is carried out for gallbladder disease in the absence of inflammation and complications it is attended with a low mortality rate of 2.15 per cent. When the gallbladder is inflamed the mortality rate for surgical treatment rises sharply to 18.4 per cent. In the presence of common duct stones, with or without jaundice, the mortality rate was 20.5 per cent. The controversial question of the best time for operation in cases of acute cholecystitis is discussed. From 5 per cent to 20 per cent of cases of acute chelocystitis will not subside and progress to gangrene and perforation. In these cases conservative surgery at an early stage will diminish the risk.

Outcome of Hemophilus Influenzae Meningitis Related to Bacterial Type.—Zinnemann presents reports of 20 cases of Hemophilus influenzae meningitis in which various methods of treatment were employed. The survey is the result of inquiries made at hospitals from which strains of H. influenzae were received for typing. The first point emerging from this survey is that reports of H. influenzae meningitis occurring in 20 children, of which 19 were caused by Pittman's type b and the twentieth by H. influenzae of the respiratory group, could be collected in a small area in less than two years. This would seem to indicate that the condition is not as rare as the scarcity of case reports indicates. The second point is the varied nature of the symptoms. Of 5 children treated only with sulfonamides, 1 recovered. Fifteen children had combined sulfonamide and penicillin treatment, and of these 8 recovered. In view of the good results reported from specific H. influenzae type b rabbit serum, the author thinks that this should be given in addition to the combined sulfonamide and penicillin treatment.

*Weather Changes and Eclampsia. N. Sapeika.—p. 461.

Primary Carcinoma of Oviducts.—Bancroft-Livingston presents the histories of 4 patients with carcinoma of the uterine tube and analyzes 33 cases that were collected from the literature. He emphasizes the difficulty of diagnosis and the bad prognosis in almost all cases. In none of the 4 reported cases was a correct clinical diagnosis made, and only twice in the collected group of 33. The difficulty of preoperative diagnosis does not seem amenable to resolution until the condition is more frequently borne in mind by clinicians, and doubtful cases in which symptoms persist after palliative treatment are subjected to laparotomy. Hysterosalpingography may occasionally be of value in differential diagnosis. Radical surgery is undoubtedly the best treatment.

Weather Changes and Eclampsia.—Since many obstetricians are of the opinion that a change in the weather may be of importance in the development of eclampsia, Sapeika investigated this factor in 45 cases of eclampsia that were observed in Cape Town, where eclampsia is comparatively frequent. Season itself does not appear to have any influence and, as far as weather changes are concerned, correlation could not be found between the onset of antepartum eclampsia and meteorologic factors.

Retinal Mechanism of Vision. F. W. Edridge-Green.—p. 906.

Pneumonoconiosis in Anthracite Miners.—This report by Gooding is based partly on clinical experience provided by examination of many hundreds of anthracite miners during the last twenty years and partly on the necropsy findings in 592 deaths among patients with silicosis. Associated tuberculosis was present in nearly a fourth of 592 certified miners who died and in 28 per cent of 516 silicotic deaths. Tuberculosis which accompanies pneumonoconiosis often lacks its usual features, and it is probable that more detailed investigation would reveal tuberculosis in a much greater proportion of silicotic miners. Emphysema was another common accompaniment of advanced silicosis, and it is responsible for much of the disablement in these men. About half of the silicotic deaths were due to cardiac failure and half to infection, chiefly tuberculosis. Signs of embarrassment of the right side of the heart were often found in the men with more advanced pulmonary lesions. This series of cases offers no evidence that there is an increased incidence of primary lung cancer in pneumonoconiotic anthracite miners. Men with clinically recognizable tuberculosis have a particularly poor prognosis, but many of those certified in the early stage survive for many years.

Steep Wave Electroplexy.—According to Strauss and MacPhail the object of the steep wave type of electroplexy or electric convulsion therapy is to produce therapeutic convulsions with minimal discomfort to the patient, minimal damage to nervous tissues, minimal disagreeable after-effects and minimal risk of extraneous accidents. The authors briefly review their previous work on electroplexy to indicate the factors which led them to construct a new type of apparatus. The technical and electrophysiologic advantages of steep wave current derived from condenser discharge are assessed against the effects of currents with other wave forms of lower frequencies (including simple alternating currents). The authors describe the construction of the apparatus and its use and outline the clinical advantages to be expected from steep wave electroplexy.

Folic Acid in Tropical Sprue.—Manson-Bahr and Clarke present a case of tropical sprue which had resisted the usual treatment for two years. After 10 mg. of folic acid had been given by mouth daily for five days there was a great improvement, which was maintained after the folic acid was discontinued. Perhaps folic acid may provide the switch by which the vicious circle of these diseases can be reversed, after which further recovery can continue without its aid.

Cholecystitis in Children.—Clavel and Dumas report 2 instances of acute calculous cholecystitis in boys aged 7 and 8 They also report data on 102 cases of biliary lithiasis in children between the ages of less than 1 and 15 years, 32 of whom were boys, 48 girls and 22 not specified. A clinical study of 22 cases is presented. The incidence of biliary lithiasis is higher among boys than among girls before the age of 10 years. It is often associated with appendicitis and consequently may not be recognized One should think of cholecystitis when one is about to establish a diagnosis of subhepatic appendicitis. The gallbladder may often be felt on palpation under anesthesia at the start of the intervention, even if it could not be palpated on preoperative clinical examination

Penicillin Therapy of Gonorrhea in Women.—Debray observed 19 failures in the course of penicillin therapy of 250 women with gonorrhea. The injections had been without accidents, but 3 women had developed severe metrorrhagia lasting two or three days. Observations on the 19 patients who had failed to respond to penicillin therapy revealed as local causes of the failure persistent urethritis, skenitis, cervicitis and bartholinitis and such general causes as extreme severity of the process, primary or secondary syphilis and obesity. Other possible causes of failure may have been old adnexitis, old metritis and abortions The author concludes that failures are much more frequent in the penicillin therapy of gonorrhea in women than is the case in men

Symptomatology of Meningitis.—Vujic directs attention to two new meningeal symptoms: tonic reflex movements provoked by sufficient and sudden bending of the head of the recumbent patient. The first is adductosupination of the feet with inside rotation of the legs (reflex of rotation). The second consists in pronation of the upper extremities (meningeal sign of pronation). The described reflexes appear in meningeal states before the neck sign of Brudzinski

Pulmonary Resection of Bronchial Adenoma.—Tricerri and his associates report 12 cases of bronchial adenoma which were cured by pulmonary resection, 8 of them by pneumectomy and 4 by lobectomy. They stress that bronchial adenoma is a surgical problem, owing to its extrabronchial extension, its potential malignancy and the irreparable damage it may produce by obstructing the distal portion. The extent of the pulmonary resection must be decided in each individual case in the course of the operation in accordance with the anatomic conditions in the extrabronchial part and the presence of metastases in the lymph nodes of the pulmonary hilus. Bronchoscopy is of great importance in the diagnosis

Cardiac Disorders in Polyarthritis.—Appelgren studied cardiac complications in 205 cases of chronic and 106 cases of acute polyarthritis Ages up to 60 are included, as the frequency of cardiac lesions in patients aged 50 and those aged 60 varies but slightly. Chronic polyarthritis, primary and secondary, dominate in the older age groups, acute polyarthritis in the younger age groups. Both acute and chronic forms are more frequent in women than in men, the proportion on the whole being 3:2 In acute polyarthritis cardiac complications occur about twice as often in women as in men, in the primary and secondary chronic forms about equally often in men and women. No definite relation was demonstrable between cardiac complication and the increased sedimentation reaction seen in about three fourths of all cases, acute and chronic. Cardiac disorders were established in 45 2 per cent of the primary chronic cases, 47 7 per cent of the secondary chronic cases and 40 per cent of the acute cases. The similarity of the results in the three different groups may indicate that the three types are to be regarded as different forms of the same disorder, depending on violence of infection, constitution and manner of reaction

Congenital Familial Anhidrosis and Neurolabyrinthitis.—Helweg-Larsen and Ludvigsen say that in 14 of the members of the family described with congenital familial anhidrosis the deficiency depends on a greatly reduced number of sweat glands, the existing glands being hypertrophic. Neurolabyrinthitis appears at the age of from 35 to 45. There are no dental anomalies, defective growth of hair, ozena or cranial deformities. The symptom complex thus has few features in common with that in anhidrosis hypotrichotica. Salt deposits are characteristic, in the milder cases as grains or rings of salt crystals, in some instances as an extensive salt crust. The defect is transmitted by simple dominant inheritance and is assumed to represent a distinct hereditary symptom complex.

Book Notices

The National Formulary. National Formulary VIII. N. F. VIII. Prepared by the Committee on National Formulary under the supervision of the Council, by Authority of the American Pharmaceutical Association. Official from April 1, 1947. Eighth edition. Fabrikoid. Price, $7.50. Pp. 850, with illustrations. [Distributed by Mack Printing Co., 20th and Northampton Sts., Easton, Pa.] American Pharmaceutical Association, 2215 Constitution Ave., Washington 7, D. C., 1946.

The eighth edition of the National Formulary was made available the latter part of 1946. It supplants the seventh edition, published in 1942, and will succeed to official status April 1, 1947. The National Formulary is one of the "official" publications that provide legal standards for drugs and medicinal preparations marketed in this country The new formulary is of special interest because of its abandonment of many useless articles described in former editions. This trend reflects some of the basic changes in drug therapy that have come about during recent years. Mainly this is manifest by replacement of outmoded crude botanicals and biologic products with highly purified extracts and synthetic compounds. Some irrational combinations of drugs have been supplanted by more simplified formulas, though some, not above criticism in this respect, have been retained to provide standards for legal control of preparations of this type that remain on the market. The new formulary contains eighty-two articles not previously included, some of which represent transfers from U. S. P. XII. Other improvements of the eighth edition are to be found in the preference given for English titles and alphabetical arrangement and in greater emphasis on the metric system by parenthesis of the approximate apothecaries' equivalents of dosage. It also includes a table of approximate dose equivalents with an explanatory statement that has been adopted jointly by the Council on Pharmacy and Chemistry and the respective committees of the U. S. Pharmacopeia and the National Formulary. This cooperative step is in keeping with the prior adoption of the metric system for New and Nonofficial Remedies by the Council on Pharmacy and Chemistry. The new formulary, more than ever, will be entrenched as a recognized source of information on therapeutic agents. It is hoped that further deletions of outmoded articles may be effected in the next edition.

Stimulyatsiya zazhivleniya ran i yazvennykh protsessov: Itogi chetyrekh let raboty no teorii i praktike stimulyatsii zazhivleniya ran i yazvennykh protsessov Sbornik 2. Pod redaktsiey i s predisloviem Prof. D. I. Goldberga. [Stimulation of Healing of Wounds and Ulcer Processes: A Summary of Four Years' Work on Problems of the Stimulation of Healing Wounds and Ulcer Processes with Ointments Containing Embryonic Emulsions. A Symposium Edited and Supplied with a Foreword and Summary. Article by Prof. D. I. Goldberg.] Paper. Price, 30 rubles. Pp. 266, with 38 illustrations. Tomsk: Izdanie Tomskogo Meditsinskogo Instituta, 1946.

The volume represents a symposium by the research workers and clinicians of the Tomsk Medical Institute on the effect of therapy with embryonal tissues on the healing of wounds. Embryos were obtained in the process of slaughter of cattle, swine and horses and were prepared under strict aseptic precautions. To 200 cc. of chopped up embryonal tissue was added 100 cc. of a vegetable oil or cod liver oil, 5 to 10 cc. of xeroform, and petrolatum or oil to make 1,000 cc. The investigators emphasize a rapid improvement in the appearance of the wounds so treated, a more rapid epithelization and healing. They speculate that the stimulating effect of the embryonal emulsion is probably the result of raising the reactivity of the tissues in hypoergic and anergic types of wounds and to the desensitizing effect of the stimulating substances in hyperergic types of wounds. Treatment with embryonal emulsion was particularly successful in burns of the second and third degree and in chilblains. This therapy, however, is definitely contraindicated in acute inflammatory processes, in the presence in the wound of necrotic masses or of extensive suppuration, foreign bodies and bone fragments. The authors emphasize that treatment with embryonal emulsion is in no sense a substitute for correct surgical intervention. They consider the method only as an auxiliary method. It must follow active surgical treatment of the wound and be combined with general and local antibacterial therapy, administration of vitamins and proper nourishment.

Medical Social Service in Tuberculosis Control. Miscellaneous Publication 37, Federal Security Agency, United States Public Health Service. Paper. Price, 10 cents. Pp. 22. Supt. of Doc., Government Printing Office, Washington, D. C., 1946.

Many of the economic and social problems which loom so large for the victim of tuberculosis may be dealt with by the properly trained medical social worker. As a liaison between the physician, the public health nurse, the community as a whole, the patient's family and the patient himself she can perform a valuable service. This booklet, published by the Tuberculosis Control Division of the Public Health Service, outlines the significant phases of the tuberculosis problem and sets forth the standards which should be met by the medical social worker in her job of assisting the tuberculous patient to adjust his life to the changes necessarily wrought by his physical condition. Her role in case finding, medical care, isolation and after-care, consultations with the various organizations concerned with treatment of the tuberculous and rehabilitation of the patient is most significant. Here is an opportunity for real social service, and more qualified women are needed for the extensive medical social work training program. Such workers can do much to alleviate the economic, social and emotional problems which follow in the wake of tuberculosis.

Applications of Germicidal, Erythemal and Infrared Energy. By Matthew Luckiesh, D.Sc., D.E., Director, Lighting Research Laboratory, General Electric Company, Nela Park, Cleveland. Cloth. Price, $5.50. Pp. 463, with 161 illustrations. D. Van Nostrand Company, Inc., 250 Fourth Ave., New York 3, 1946.

This is a compilation of knowledge and information gleaned through research and studies of the author and his colleagues in the field of ultraviolet, visible and infrared radiation. The subject matter is expertly assembled and the book is very readable. The physiologist, general practitioner and physiatrist will be more interested in the biologic effects of radiant energy than in the nonmedical applications. One chapter deals with erythema and tan, another with artificial sunlight, and a third with units and terminology. These chapters contain an abundance of selected and specialized information on the biologic effects of ultraviolet and infrared radiation. The data are in the form of tables, charts and graphs which are useful for reference. Various sources of radiation are described, including lamps which were used many years ago. The modern fluorescent lamps and newer sources of ultraviolet and infrared radiation are also explained. Their electrical and radiation characteristics are given.

One application of ultraviolet radiation advocated is the disinfection of air. The idea provokes one's imagination and any one who thinks about it hopes that a method can be developed which will prevent cross infection of disease in places where people congregate. The author devotes at least 200 pages to this subject. Another organization, the Council on Physical Medicine of the American Medical Association, has made a study of this problem too and its opinions are expressed in an article "Acceptance of Ultraviolet Lamps for Disinfecting Purposes" which appeared in The Journal in June 1943. The opinions of the Council differ from the ideas expressed by the author of this book. Committees of the National Research Council and of the American Public Health Association feel that the use of ultraviolet radiation for reducing certain infectious diseases is still purely in the experimental stage.

When reading the volume one cannot help but be impressed by the author's enthusiasm for promoting new uses for products manufactured by the company of which he is the director, the Lighting Research Laboratory. Psychiatrists will find this book a valuable addition to their libraries as a reference on the subject of radiation.

Suggestions for Courses in General Chemistry. By L. Jean Bogert, Ph.D. A Teachers' Guide Prepared for Use with the Sixth Edition of Bogert's Fundamentals of Chemistry and the Fifth Edition of Bogert's Laboratory Manual of Chemistry. Paper. Pp. 14. W. B. Saunders Company, W. Washington Sq., Philadelphia 5; 7 Grape St., Shaftesbury Ave., London, W. C. 2, 1946.

The suggestions presented in this pamphlet, which contains outlines for various courses in general chemistry, might better be left to the judgment of the instructor.

Symposia on Present Day Social and Economic Aspects of National Health and the United Nations Educational, Scientific and Cultural Organization, and American Participation in Its Activities: Papers Read Before the American Philosophical Society Annual General Meeting April 18, 19, 1946. Proceedings of the American Philosophical Society held at Philadelphia for Promoting Useful Knowledge, Volume 90, Number 4. Paper. Price, $1. Pp. 251-317. American Philosophical Society, Independence Square, Philadelphia 6, 1946.

This collection of papers read before the American Philosophical Society in April 1946 contains a considerable amount of worthwhile observation and thinking on the general subject of our national health. The introductory paper, "The Health of the American People," by Richard Harrison Shryock, is a historical survey of the developments in medical practice from Colonial days. He notes the progress which has been made but also presents the problems which are yet to be met. "The price of medical progress," he observes, "like that of liberty, is eternal vigilance."

"Mental Hygiene," by Dr. Winfred Overholser, presents a picture of what is held to be the largest and most pressing problem in the entire field of public health—mental health. Dr. Overholser speaks of the importance of psychosomatic medicine, of progress being made in group therapy, of narcosynthesis, of shock therapy, of child guidance and of industrial psychiatry. He stresses the need for recognition of psychiatry as an essential part of general medicine and urges that research in this field be more vigorously pressed.

I. S. Falk's paper, on "The Role of Government Agencies in a National Health Program," cites the lack of coordination of public health functions at the local, state and federal levels and approaches the issue of government medical care from the administrative point of view. He prescribes general methods of administration for federal compulsory health insurance, stating that medical care would function on a consumer basis at the local level. He presupposes the adoption of sickness and disability programs, recommending that state governments be used as agencies of the national government in the administration of a medical care insurance system. His proposals are broad and general, and they require much elaboration before they acquire feasibility.

Dr. Howard A. Rusk presents a timely report on "Convalescence and Rehabilitation" in which he urges large scale adoption of the Veterans Administration programs in civilian hospitals, so that greater progress can be made in the rehabilitation of the large numbers of crippled and otherwise physically handicapped citizens in addition to our war veterans. The injured industrial worker as well as the wounded veteran needs the help of a well developed rehabilitation program if he is to be conditioned for normal function and adjustment in his community.

In "The Place of the Physician in Modern Society" Henry E. Sigerist writes that it is the role of the physician to perform four major tasks. These are the promotion of health, the prevention of disease, the restoration of a patient's health and rehabilitation of the patient. The physician, says Professor Sigerist, is scientist, educator, social worker, friend and leader in the progress of our civilization.

W. A. Milliman, in his paper "The Relationships Between Governmental and Private Responsibilities for National Health," presents the problems which have been left virtually untouched and unsolved by the erstwhile proponents of national compulsory health insurance. The problem of controls and certain abuses of such a system, the lack of candor on the part of those who would have the government step into the practice of medicine, the effect of a national health insurance system on the quality and supply of medical service, and the position of the medical profession are dealt with objectively and critically. His observations are refreshing and worthy of consideration by those who would shy away from the practical problems of national health insurance. He discusses too the temporary cash disability benefits and presents a sound argument for the employer rather than the state or federal government as the ideal person for the responsibility of paying claims. All who are interested in the question of medical care insurance would do well to read this paper.

A dramatic climax to the symposium is the paper by Major Gen. Warren F. Draper of the U. S. Public Health Service, entitled "Public Health Experiences in the European Theatre of Operations." In addition to describing the work done by the G-5 Civil Affairs Division in dealing with the problems of civil governments and civilians in the devastated war areas, Major General Draper gives a harrowing account of what he saw in the German concentration camp at Buchenwald.. This "extermination factory" was only one of many, and the horrors which he describes are something we cannot afford to ignore or forget.

Blodets askorbinsyre hos sunde og syke. Av Johannes Hagtvet. [Ascorbic Acid Content of Blood in Health and Disease.] Skrifter utgitt av Det norske Videnskaps-Akademi i Oslo, I. Mat.-Naturv. Klasse, 1945, No. 2. Paper. Price 9 kroner. Pp. 121, with 45 illustrations. I Kommisjon hos Jacob Dybwad, Torvet 2, Oslo, 1945.

This monograph deals with the methods, scope and results of a study of the ascorbic acid content of the blood in health and in disease. The work has been awarded the Skjelderup gold medal by the medical faculty of Oslo university. In 722 healthy subjects the yearly curve of the ascorbic acid in the blood reached its maximum in August and September, just like the ascorbic acid in the potato, which suggests that the potato is a main source of vitamin C nutrition of the Norwegian urban population. Extensive determinations are reported of ascorbic acid concentration in the blood in various diseases, and a chapter is devoted to clinicotherapeutic considerations. An English summary gives the main results.

Outline of the Spinal Nerves. By John Favill, A.B., M.D., F.A.C.P., Clinical Professor of Neurology (Rush), University of Illinois College of Medicine, Chicago. Cloth. Price, $3.75. Pp. 191, with illustrations. Charles C Thomas, 301-327 E. Lawrence Ave., Springfield, Illinois, 1946.

This is a unique reference book which attempts to supply full information on motor functions. It consists of lists of roots, nerves and muscles and of movements arranged in such a manner that one can start at any point and trace the nerve pathways. Supplementary data and drawings add to the ease of reference. In his preface Dr. Favill expressed the view that errors would be inevitable and that information on them would be appreciated. It is unfortunate that he died suddenly just about the time of the appearance of this volume, and it is to be hoped that some one else will continue his work and incorporate in future editions any corrections or improvements which are discovered by those who use the book.

The Royal Cancer Hospital Mechanically Sorted Punched Card Index System. Compiled by D. W. Smithers, M.D., M.R.C.P., D.M.R., K. M. H. Branson, M.B., F.R.C.S., and H. O. Hartley, Ph.D. Paper. Pp. 102. Royal Cancer Hospital, London, S. W. 3, 1945.

The system of recording information about cancer patients so that it may be sorted mechanically by means of punched cards is on preliminary trial in the Royal Cancer Hospital and the hospitals which cooperate with it in cancer work, preliminary to adoption on a more permanent basis. The book describes in detail the filling in of special cards and the coding for mechanical sorting. The book should be studied by all concerned with the keeping of adequate records of the observations on cancer patients and the results of treatment. The workings of the Royal Cancer Hospital system will be followed with special interest because it covers many hospitals. The advantages of uniformity of records in cancer clinics appear so obvious as to merit careful consideration, especially in large cancer centers.

Fundamentals of Chemistry. By L. Jean Bogert, Ph.D. Sixth edition. Cloth. Price, $3. Pp. 571, with 155 illustrations. W. B. Saunders Company, W. Washington Sq., Philadelphia 5; 7 Grape St., Shaftesbury Ave., London, W. C. 2, 1946.

This book has undergone another edition, primarily designed for those concerned in medicine, nursing and public health; it also covers the related sciences. It has been brought up to date.

Laboratory Manual of Chemistry. By L. Jean Bogert, Ph.D. Fifth edition. Loose-leaf. Paper. Price, $1. Pp. 196, with 27 illustrations. W. B. Saunders Company, W. Washington Sq., Philadelphia 5; 7 Grape St., Shaftesbury Ave., London, W. C. 2, 1946.

This manual provides simple experiments for the author's textbook "Fundamentals of Chemistry," to which it forms a valuable adjunct.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

GROWTH PROMOTING AGENTS

To the Editor:—I should like information on the probable effects of oral testosterone in aiding the growth of an 11 year old boy who is 52½ inches (132 cm.) in height and has no evidence of obesity or hypogenitalism or other endocrine disturbance, with normal epiphysial development. Would this cause early epiphysial closure with further stunting of growth?

Emil Rothstein, M.D., Wood, Wis.

ANSWER.—According to tables given in "Holt's Diseases of Infancy and Childhood" the range of normal height for boys 11 years of age is from 53 3/10 to 57 1/10 inches (135 to 145 cm.), while the patient mentioned is 52½ inches tall, only slightly shorter than the smallest of "normal individuals."

A few of the many causes of dwarfism are cretinism, chondrodystrophy, hypopituitarism, chronic malnutrition (including diabetic dwarfism) and renal insufficiency. Dwarfism caused by ovarian insufficiency has been described by Varney, Kenyon and Koch. It is not known definitely that a corresponding hypogonadal dwarfism occurs in the male. In fact, when hypogonadism in males occurs before puberty they are usually of normal or greater than normal height. In addition to the definite entities mentioned, there is a condition in which a so-called normal or pituitary dwarf seems to be normal in all respects save size. Such a normal dwarf will probably have an epiphysial age which corresponds closely with his chronologic age. It should be possible to demonstrate by roentgenologic examination of the average boy 11 years of age the external condyle of the humerus and the tubercle of the tibia (tables are given in Holt).

Difficulties arise in the evaluation of growth promoting agents because of the large number of unpredictable variations in the rate of growth that occur normally during childhood and adolescence and because of the poor correlation between height during the period of growth and height ultimately attained. Furthermore, it is difficult, if not impossible, to decide before a boy has reached the age of 15 whether hypogonadism is present or whether development is merely somewhat slower than is normal. This uncertainty has led to much confusion in the interpretation of the effects of various endocrine preparations on prepuberal children.

Agents which have been used in an attempt to stimulate growth include thyroid, pituitary growth hormone, chorionic gonadotropin and testosterone. Reports have been made of the effectiveness of a combination of thyroid and growth hormones. In such cases one cannot be certain which agent was responsible; and unless hypothyroidism is present it is doubtful whether thyroid is of value (Shelton). Cretinism, of course, responds dramatically to treatment with thyroid. A pituitary growth hormone has yet to be prepared which is of value in the treatment of patients. Chorionic gonadotropin from whatever source seems to exert its effects on growth by stimulation of the testes to form testosterone. A number of studies of the effects of testosterone on the growth of boys have been made; but because of the relatively small number of subjects and the inherent difficulty of obtaining adequate controls, final conclusions should not be drawn. Clinical studies suggest, however, that testosterone usually will cause acceleration of growth both of quantity of muscle and of length of some bones. Evidence also suggests that epiphysial closure may be hastened by testosterone, and cases of dwarfism apparently secondary to the formation of male hormone by tumors in childhood have been reported. It is impossible to predict which of these two effects of testosterone will predominate in any given case; it is impossible to say whether the increased rate of growth of bones or the earlier closure of epiphyses will have the greater effect. Therefore it may be questioned whether administration of testosterone will have any effect whatever on the ultimate height attained at maturity.

Well controlled studies of rats and mice indicate that the effect of testosterone on the growth of bone is minimal. Therefore it is suggested that administration of testosterone in a case such as the one about which inquiry was made be regarded as experimental and that the study be controlled as well as possible.

PITRESSIN FOR HYPERTENSION

To the Editor:—An article appeared in a lay magazine quoting Dr. J. Q. Griffith Jr. of the University of Pennsylvania on the use of pitressin in hypertension. Please discuss the rationale of this therapy.

G. E. Bowdoin, M.D., Elkhart, Ind.

ANSWER.—The rationale of the use of pitressin in hypertensive disease is based on the observation that the serums of hypertensive patients contain a substance capable of suppressing water diuresis in rats and the suspicion that the posterior lobe of the pituitary produces this antidiuretic hormone. Repeated injections of aqueous pitressin, given daily, increase the antidiuretic titer of the urine for a few days, but subsequently the urine attains diuretic properties. It was suggested that this effect is due to the appearance of an antihormone. Injections of small doses of pitressin tannate in oil weekly for three weeks and then monthly for three months are reported to have resulted in considerable benefit in patients selected because (1) bioassay for antidiuretic hormone is positive, (2) bioassay for gonadotropic substance in serum is negative at the level of 330 mouse units per hundred cubic centimeters and (3) renal function is normal (Griffith, J. Q., Jr.; Padis, N., and Anthony, E.: Selection of Patients with Arterial Hypertension for Treatment by Repeated Injections of Pitressin, Am. J. M. Sc. **212**:31 [July] 1946). The results parallel those obtained with pituitary irradiation. Therapy with pitressin is applicable to only a few cases of hypertensive disease in which pituitary involvement is clearly demonstrated It will probably not solve the major problem of most hypertension, for there are many and various etiologic patterns.

CRETINISM AND MARRIAGE

To the Editor:—A woman aged 20 was diagnosed as a cretin shortly after birth. She has been given controlled doses of thyroid all her life and at present is using 1 grain (65 mg.) per day. She has some speech difficulties and wears an upper plate because of malocclusion. She has difficulty with fine motions of the hands but is able to write and to play the piano. Her weight is about normal for her height, and the skin and hair are only slightly suggestive of hypothyroidism. Her intelligence is apparently close to normal. She has done clerical work in her own home and has carried on correspondence as a member of a "letter club." She has finished the equivalent of a high school education under the tutelage of her mother, who is a trained educator and teaches underdeveloped children. The menarche occurred at 13 years of age; the menstrual periods are normal. The basal metabolic rate is within normal limits on the above thyroid dosage. The patient is contemplating marriage and has asked the following questions: 1. Is she likely to become pregnant? 2. In the event of pregnancy will the offspring be normal? 3. If the offspring are apt to be abnormal is a sterilization justified? What is the legal status of sterilization in a woman whose offspring are apt to be abnormal?

Sidney W. Raymond, M.D., Chicago.

ANSWER.—1. Since the patient is menstruating at regular intervals and would appear from the description given in the inquiry to be normally developed sexually, it is probable that she is fertile and can bear children. There is, of course, no way of being absolutely certain that any woman is capable of becoming pregnant until actual trial is made.

2. In the event of pregnancy the chances are that the offspring will be normal. The risk of the patient's giving birth to a cretinoid child is slightly greater than it would be if her thyroid gland was normal but the risk is small, so that it may be disregarded.

3. Since it is unlikely that the patient's offspring, if any, will be abnormal, sterilization is not justified. There would be no legal justification for such sterilization regardless of what the outcome of pregnancy might be.

CORONARY DISEASE AND FLYING

To the Editor:—A man aged 53 had a coronary occlusion two and one half years ago and recovered entirely from this attack except that he now has anginal pain on walking. Being a busy executive, he would like to fly long distances. Is there any danger when the plane attains a high altitude or when a sudden landing or an air pocket causes considerable loss of altitude? Are pressurized cabins or oxygen masks reasonable insurance against these risks?

M.D., Pennsylvania.

ANSWER.—The degree of coronary heart disease is most important. If angina pectoris is produced only by a considerable amount of effort, there would be no particular hazard in flying even at fairly high altitudes; but, if the coronary heart disease is severe and angina pectoris occurs at rest or on very slight exertion, there is a hazard not only from flying but from any other strain, great or small. Pressurized cabins and oxygen masks may reasonably be expected to reduce the risk of trouble in serious heart disease on flying at high altitudes, but not enough experience has been collected to warrant detailed statements of such preventive measures.

COSMETIC DERMATITIS

To the Editor:—A woman aged 36 has been a beauty parlor operator for several years. In August 1946 she developed a dermatitis on the fingers of the right hand. This gradually became worse and appeared on the fingers of the left hand. The lesions were accompanied with severe itching. She tried wearing rubber gloves but she could not work satisfactorily with them. However, when gloves were worn part of the time the lesions began to subside. When first examined three weeks after the onset, the patient presented patchy areas of dermatitis on the sides of the fingers and on the dorsum near the base of the nails. The lesions were dry and scaling and were thought to be subsiding. General physical examination was essentially negative. There were no other areas of dermatitis on the face, body or feet. Though the patient has been a beauty operator for several years, she has never had any cutaneous lesions before. New cosmetic items have not been used. A diagnosis of dermatitis venenata due to a cosmetic irritant was made. The patient was advised to stop working and not to use cosmetics. She was given mild tar ointment to apply twice daily. In the next five days the lesions disappeared almost completely and the itching subsided. On the fifth day she gave two finger waves without rubber gloves, using Hair Vita Finger Waving Lotion. In the next twelve hours she developed intense itching of both hands, including the palms. Many small papular lesions appeared on the lateral and volar surfaces of the fingers and palms, with a generalized redness of the skin of the hands. What substances in cosmetics are the common cause of contact dermatitis? What are the ingredients of Hair Vita Finger Waving Lotion? What other cosmetic preparations contain the same ingredients? Is skin testing and desensitization for these substances possible and successful? Of what value are the so called protective lotions which are rubbed on the skin previous to contact?

Lawrence O. Goodman, M.D., Marshalltown, Iowa.

ANSWER.—Cosmetic dermatitis usually appears abruptly and clears up in a reasonable time after contact with the sensitizer or the irritant has been discontinued. The eruption usually consists of erythema, edema, papules, vesicles, exudation, crusts and exfoliation. It tends to form patches with indefinite borders and is usually accompanied with pruritus. In chronic cases the skin becomes thickened, pigmented, infiltrated and fissured.

Dermatitis venenata produced by cosmetics is mostly due to an allergy on the part of the patient. The user was or has become sensitized to the cosmetic. However, there are chemicals which in certain concentrations will cause dermatitis of any one exposed to their action for a sufficient length of time. These are called primary irritants. Most of the chemicals used in cosmetics today are innocuous to most people.

It is impossible in so short a space to list all the primary irritants and sensitizers in common use in the various cosmetics. There are many excellent textbooks on the subject. Schwartz and Peck in their book on Cosmetics and Dermatitis, published by Paul B. Hoeber, Inc., in 1946, have a complete survey of modern cosmetics and their effects on the skin.

The exact constituents of Hair Vita Finger Waving Lotion have not been obtained. However, finger wave lotions have not materially changed in formulation for quite a few years. Hair Vita Finger Waving Lotion is apparently a cold wave lotion. Cold waving consists in applying solutions of chemicals to reduce and soften the hair so that it loses its elasticity and can take a curl. Then oxidizing solutions are applied to set the curl. In addition to this, usually 1 to 5 per cent solution of various gums or resins are applied to hold the curl. They also contain a small amount of alcohol for drying and perfume. The reducing agents are usually inorganic sulfides or thioglycolates. The oxidizing agents are usually iodides or "per" salts. The gums or resins commonly used are karaya, acacu, tragacanth, quince seed, sodium alginate, soluble shellac, chondrus or casun.

From the information contained in the inquiry, the lotion may contain sodium thioglycolate as a reducing agent. In recent years many cases of dermatitis have been found to be attributable to this substance. However, it is possible that the patient was sensitive to some other product used prior to the finger wave. In the past few years many wetting agents or synthetic detergents have replaced soap shampoos.

Skin testing, particularly the patch test, has become quite helpful in the search for the causal allergens. But the proper application of the patch test and the correct interpretation of the results have given some difficulty. Positive reactions have been known to occur with substances that had nothing to do with the causation of the eruption and, conversely, clinically proved allergens may give negative results. The reaction must therefore always be carefully correlated with other available data. It is especially important to ascertain the clinical effects of the removal of the substance and the clinical effects of reexposure.

Specific desensitization cannot be accomplished with satisfactory regularity at present. Some people become desensitized, others not. The use of protective lotions or creams of the nongreasy type may offer some protection in occupational dermatitis, but soap and water remove them and as a result have little value for a beauty parlor operator.

RENAL GLYCOSURIA

To the Editor:—A woman has a normal blood sugar value which ranges from 60 to 90 mg. per hundred cubic centimeters, and a low kidney threshold. What medicine can be used to control this low kidney threshold and glycosuria?

Kenneth A. Ohme, M.D., Mitchell, Neb.

ANSWER.—A diagnosis of renal glycosuria can be made if glycosuria consistently accompanies normal values for blood sugar, if pentosuria, fructosuria, lactosuria and galactosuria are excluded by tests described in any standard textbook of laboratory procedure and if the result of the glucose tolerance test is normal. This condition frequently is familial and hereditary and tends to be lifelong. The metabolic error is a failure of the renal tubules to reabsorb entirely the glucose in the glomerular filtrate. Loss of glucose in the urine may lead to mild symptoms of hypoglycemia or some loss of weight, but ordinarily the patient considers himself in good health and is unaware of his condition. Renal glycosuria will not develop into diabetes mellitus.

There is no drug capable of restoring the ability of the tubular cells to reabsorb glucose, and treatment is not indicated other than subsistence on a diet generous enough to compensate for the loss of glucose in the urine. Insulin therapy will only exaggerate the tendency toward hypoglycemia and may be dangerous. The "renal threshold" may be raised somewhat by any measure that will diminish glomerular filtration, such as dehydration or shock, but such a measure is obviously unpractical and would lead to harm.

The glycosuria that follows the administration of phlorhizin also is caused by failure of tubular reabsorption. However, the rate of loss of glucose is so great in this condition that ketosis and acetonuria result unless an adequate supply of carbohydrate is administered.

More information can be obtained in the following references:

SIALORRHEA AND MORPHINE ADDICTION

To the Editors:—What can be done to correct extreme salivation in a woman aged 69 suffering from a coronary sclerotic heart disease who has become addicted to morphine with atropine? Her daily dosage is about 1 grain (65 mg.)

M.D., New York.

ANSWER.—A relationship between salivation and the use of moderate or large doses of an opiate is not known. When physical dependence to an opiate exists, sialorrhea may occur during withdrawal. This is a temporary phenomenon.

A common cause of long-continued and severe salivation is the parkinsonian syndrome, whatever the etiology. In this patient, even though a well defined parkinsonism is not present, the administration of an atropine-like preparation in as large doses as can be tolerated might be tried.

The use of the word "addicted" in this and similar situations must be challenged. To assume that addiction exists, something more than the habitual use of a substance or pursuit of a practice must be present. Three criteria must be met: (1) loss of control with reference to a substance or practice, (2) harm in some form to the patient, to his group or to both and (3) condemnation by society of the use of the substance or pursuit of the practice. It seems unlikely that any but the first criterion, if that, can be met here.

Persons suffering from heart disease who have been placed on an opiate routine sometimes develop a habitual use over and above the therapeutic needs and may be considered addicts. Such an addiction can be corrected rather easily if we can control the patient and the environment. Sometimes, however, if we try to establish total abstinence from opiates the patient may exhibit signs and symptoms, including those of decompensation, which the physician inexperienced in the treatment of the abstinence syndrome may confuse with this picture. If he persists in his withdrawal regimen, serious decompensation, even death, may result.

It is debatable whether the administration of opiates to cardiac patients to the point of physical dependence is justifiable. Prolonged administration of small amounts after dependence has been established is not justified.

TREATMENT OF FASCIOLOPSIS INFECTION

To the Editor:—A patient, who was in the Army, had abdominal cramps and occasional diarrhea while in the South Pacific. Physical examination at that time apparently gave normal results. Since then there has been considerable loss of weight and a slight anemia. A stool examination revealed ova of Fasciolopsis buski. This diagnosis was confirmed subsequently by several laboratories. Two courses of hexylresorcinol have brought only temporary relief. Ova can still be recovered from the stool after the second course of treatment. Please outline the treatment of this disease.

Richard D. Falkenstein, M.D., Pampa, Texas.

Answer.—Fasciolopsis buski is an oriental fluke found in man chiefly in the small intestine and especially in the duodenum. It may be found attached in the stomach and upper part of the colon. Its geographic distribution south of Borneo is poorly known, although one might expect it exceptionally in the south Pacific islands. In the case described in the query, it is important to be certain of the differential diagnosis, especially from Fasciola hepatica, Fasciola gigantica and Echinochasmus perfoliatus.

Treatment of choice is with (1) tetrachlorethylene, (2) carbon tetrachloride or (3) beta-napthol. Hexylresorcinol is much less efficient, a cure rate of only 54 per cent being reported by McCoy and Chu (*Chinese M. J.* **51**:937 [June] 1937).

1. Chemically pure tetrachlorethylene is given in an adult dosage of 3 cc. in a single dose. Epsom salt 15 Gm. (½ ounce) should be given in a glass of water the night before treatment. The patient fasts the following morning and takes 3 cc. of the drug in gelatin capsules. Two hours later the patient repeats the Epsom salt, 15 Gm. in a glass of water. Transient dizziness and headache disappear with the action of the second dose of Epsom salt.

2. Chemically pure carbon tetrachloride is given in a dose of 3 cc. in a little water or milk. On the preceding evening the patient has a light supper of toast and milk, followed by an enema. On the morning of treatment the patient fasts until after good purgation has occurred. Two hours after the carbon tetrachloride the patient is given 15 cc. of Epsom salt in a glass of water. This drug is toxic and the patient should receive full dosage of calcium lactate or gluconate orally for four days before treatment. Contraindications are fever, alcoholism, cirrhosis of the liver and diseases of the kidneys or respiratory tract.

3. Beta-napthol must not be used in pregnancy or malaria. It is given in two doses of 0.2 Gm. each in gelatin capsules.

Reference: Faust, E. C.: Human Helminthology, ed. 2, Philadelphia, Lea & Febiger, 1939 p. 178.

PRESERVATION OF SPERMATOZOA

To the Editor:—Please give formulas for the preservation of sperm cells in viable form. A solution is needed for a "sperm bank" for research work on lower animals.

M.D., New York.

To the Editor:—Is there a way to preserve spermatozoa for use in artificial insemination? Most reports suggest that the semen be obtained from the donor in the office and used within an hour or so. This is not always possible, especially in a small town. If the sperm cell can be preserved, for how long will it be usable?

M.D., Texas.

Answer.—Sperm cells of different mammals exhibit great variability in periods of viability after collection of semen. Most information comes from investigations on sperm from livestock. Viability—i. e. capacity to show movement on proper handling—persists longer than the capacity to fertilize the egg.

According to Green, Winters and Comstock (Bull. 336, University of Minnesota Agricultural Experiment Station) sheep sperm for artificial insemination are preserved longest when equal quantities of semen and dilutor are mixed (dilutor monosodium acid phosphate 1 part, water 12 parts, 15.4 Gm.; potassium dihydrogen phosphate 3.2 Gm.; sterile distilled water 1 liter, calcium sulfate saturate). The p_H should be 7.0.

An egg yolk dilutor has been used successfully for bull semen by Lardy and Phillips (*Am. Soc. Anim. Prod. Proc.* **32**:219, 1939), and the method has also been used for stallion, ram and boar semen. A dilutor is made of equal volumes of fresh egg yolk and a sterile buffer (potassium dihydrogen phosphate 0.2 Gm. and monosodium acid phosphate 1 part, water 12 parts, 2 Gm., in 100 cc. of sterile distilled water). The p_H of the mixture should be approximately 6.75. One part of semen may be added to 3 or 4 parts of the buffer solution. Calves and lambs have been born after insemination with such diluted semen for six to seven days, but in field practice storage longer than forty-eight hours is not recommended. Storage of semen in the dilutor should be kept at temperature of about 41 F.

Good methods of preserving human spermatozoa for delayed artificial insemination are unknown. The following general principles can be stated: Storage must be at low temperatures and cooling should be gradual (temperatures below 41 F. are always used for animal spermatozoa); air should be excluded, perhaps by covering undiluted semen in small tubes with liquid petrolatum; changes in temperature should be slow. Human sperm have been retained in motile condition for several days in egg yolk solutions as with farm animals, but fertility is probably limited to twenty-four to thirty-six hours storage.

FIBER GLASS CLOTHING

To the Editor:—A boy aged 3 years is unable to wear wool garments because of an allergic skin reaction. It will be difficult to obtain satisfactory snow suits for him in winter. Good quality snow suits are available which are constructed of Byrd cloth (cotton) exterior with a woven cotton lining and an interlining of spun glass instead of ordinary wool. The interlining does not come in direct contact with the wearer because it is encased between the Byrd cloth exterior and the woven cotton lining. Can skin irritation from spun glass or fiber glass occur under these circumstances? Is this type of clothing desirable and safe for a child with a sensitive skin?

M.D., Illinois.

Answer.—Dermatitis from spun glass fabrics is in a large majority of cases due to direct physical irritation of the skin by the sharp glass fibers. Only rarely does a case of allergic dermatitis occur from whatever resins are used in forming the fibers from the spun glass. If the glass interlining does not touch the skin, dermatitis cannot occur from the glass itself. Clothing worn under the snow suit would also prevent contact of the glass fabric with the skin.

If the child's sensitivity is only to wool and not to other substances, such a garment as you describe should not irritate the skin.

DIAGNOSIS OF BLEPHAROCONJUNCTIVITIS

To the Editor:—A woman aged 70 has had an itching of the eyelids involving the conjunctivas for several weeks. Commonly used preparations such as mild silver protein, butyn, 1 and 2 per cent yellow oxide of mercury, holocaine ointment and boric acid solution give only temporary relief. *The patient has had similar attacks each summer for* the past three or four years but the present attack is prolonged and resists the ordinary measures. There is no inflammation in any of these tissues—just an annoying itching, a sort of essential pruritus. Her general health is fair. Her eyes are properly refracted. The condition does not seem to be allergic. Kindly advise me of any treatment that might relieve the condition.

Joseph A. Robinson, M.D., Darlington, S. C.

Answer.—This must be either a case of neurodermatitis common in older women or an allergy.

The fact that it has recurred for three or four years points to an allergy which is seasonal. The fact that it persists beyond the summer does not rule this out. With an allergy one sees follicles of various sizes in the lid conjunctiva, velvety tarsal conjunctiva or minute cystic-like follicles on the upper tarsal border. There may or may not be a stringy secretion. Conjunctival scrapings often reveal eosinophils.

The neurodermatitis condition most often presents wrinkled, brownish lid skin, with silvery scales and no conjunctival involvement other than dilated conjunctival blood vessels. The same picture has been caused by local sensitivity to cosmetics, soap or perfume.

The treatment consists in small doses of phenobarbital, cold compresses and, if the itching is very severe and not alleviated by cold compresses, the use of an ointment containing 1 per cent salicylic acid.

CHOLESTEATOMA

To the Editor:—Is there any medication which, by instillation or irrigation of the middle ear, will dissolve cholesteatomatous masses so that they can be removed easily from the external ear canal?

M.D., California.

Answer.—The middle ear cavity, which is the usual site of cholesteatoma, may be irrigated with increasing strengths of alcohol solution, starting with about a 50 per cent solution. This irrigation must be carried out with a special cannula the curved tip of which is inserted through the perforation in the drum membrane, which leads to the attic, the situation of most cholesteatomas.

It is better to use stronger, rather than weaker, alcohol solutions, because a cholesteatoma will swell if water is used as the irrigating fluid. The use of water in the ear in the presence of cholesteatoma may lead to serious consequences, because the cholesteatomatous mass may swell and, by pressure, expose the dura and inner ear to infection.

Ether has been used by some as an irrigating solution, but more discomfort is caused by ether than by alcohol.

RICKETTSIALPOX—A NEWLY RECOGNIZED RICKETTSIAL DISEASE

II. Clinical Observations

MORRIS GREENBERG, M.D.
OTTAVIO PELLITTERI, M.D.
IRVING F. KLEIN, M.D.
and
ROBERT J. HUEBNER, M.D.
Bethesda, Md.

Reports of cases of an unclassified disease were first received by the New York City Department of Health toward the end of June, 1946. Most of the cases came from a single housing development covering three square blocks in one of the five boroughs of the city. As news of the disease spread among physicians, cases located in three other boroughs were called to our attention. This report of the clinical findings is based on the observation of 144 nonfatal cases. Most of the patients were observed during the course of their illness, but some were seen only after recovery.

The etiology,[1] epidemiology[2] and method of transmission[3] of the disease are considered in other papers in this series. Identical strains of rickettsias have been isolated from the blood of 2 patients[1] and from two pools of rodent mites, Allodermanyssus sanguineus (Hirst).[3a] The name rickettsialpox has been proposed for the disease,[1] and the name Rickettsia akari for the causative organism.[3a]

The clinical data were obtained by epidemiologists of the New York City Health Department and by a representative from the U. S. Public Health Service, who investigated each case reported to the New York City Health Department from the housing development where the majority of cases occurred and the independent and isolated cases from other boroughs of the city. Diagnoses were based on typical clinical findings, supported in many of the cases by laboratory data, particularly the failure of convalescent serums to agglutinate *Proteus OX 19* and the presence of complement fixation reactions with rickettsialpox antigens.

Twelve patients were hospitalized. We were able to study these 12 cases more thoroughly, with daily observations and more complete laboratory studies.

CLINICAL DESCRIPTION

The disease was characterized by an abrupt onset of chills, fever, sweats and backache, followed after several days by a rash. Prior to the onset of fever by about a week there was an initial lesion, variously described by the patients as a pimple, boil, blind boil or insect bite.

1. *Initial Lesion.*—The initial lesion started as a papule, more or less round, firm to the touch and red. The surrounding skin appeared normal without erythema or induration. The papule grew in size, and the center became vesiculated; the vesicle was, however, deep seated and firm. The fluid in the vesicle was at first clear but occasionally became cloudy (fig. 1). Ultimately it shrank and dried, and a black eschar formed (fig. 2). In its fully developed state the lesion frequently resembled certain stages of vaccinia. At the height of development, which occurred during the febrile period, the papule was round or oval and the diameter at its base varied from about 0.5 cm. to 1.5 cm. The central part of the papule nearly always consisted of firm black eschar. The surrounding skin was erythematous, but there was no induration. The lesion was not tender, nor did it itch. The regional lymph glands were usually enlarged and sometimes were slightly tender to the touch. Lymphangitis was not noted. The initial lesion persisted approximately three weeks and usually left a small scar. Patients occasionally denied the existence of an initial lesion, apparently because they confused it with the rash which followed later. However, a careful inspection of the body usually revealed it. Of 144 cases investigated, in 96, or 67 per cent, of the cases the patients noticed an initial lesion. However, of 86 cases seen by us while the rash was still present, the initial lesion was observed in 82 cases, or 95 per cent. The initial lesions were seen chiefly on the covered parts of the body. However, they were also seen on the neck, face, arms and dorsum of hands (table 1).

2. *Onset of the Disease.*—The onset was sudden and was characterized by chills, fever, sweats, backache and lassitude. It usually occurred about a week after the beginning of the initial lesion. However, since many patients paid little attention to the initial lesion until they became sick, different intervals have been given. The average interval was three to six days. The longest interval reported was seventeen days.

a. Fever: Fever was always present. This was often low grade at onset, but usually it rose rapidly to reach 103 to 104 F. Typically it persisted, with morning

Isolation of a Rickettsia Apparently Identical with the Causative Agent of Rickettsialpox from Allodermanyssus Sanguineus, a Rodent Mite, Pub Health Rep **61:** 1677-1682 (Nov. 22) 1946 (*b*) Greenberg, Pellitteri and Jellison[2]

remissions for about a week, defervescing gradually to normal. However, fever was variously reported to last from two to ten days.

b. Chills: Chills occurred in 70 per cent of the cases during the first two days, frequently preceding the fever. They were not so severe as in malaria but were sufficient to make the patient uncomfortable. It was not unusual for a patient to have two or more chills a day. Occasionally, patients had chilly sensations rather than frank chills.

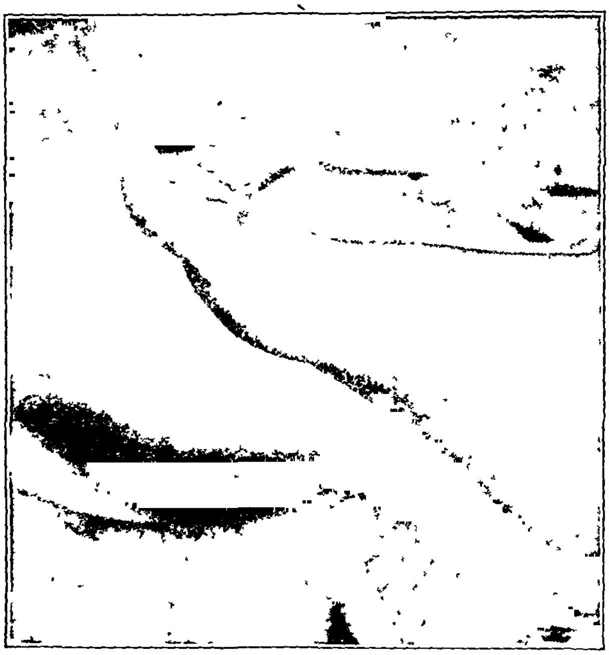

Fig 1.—Initial lesion at the base of the large left toe. The vesicle in the center of the papule is cloudy. Later it will dry and a black eschar will result.

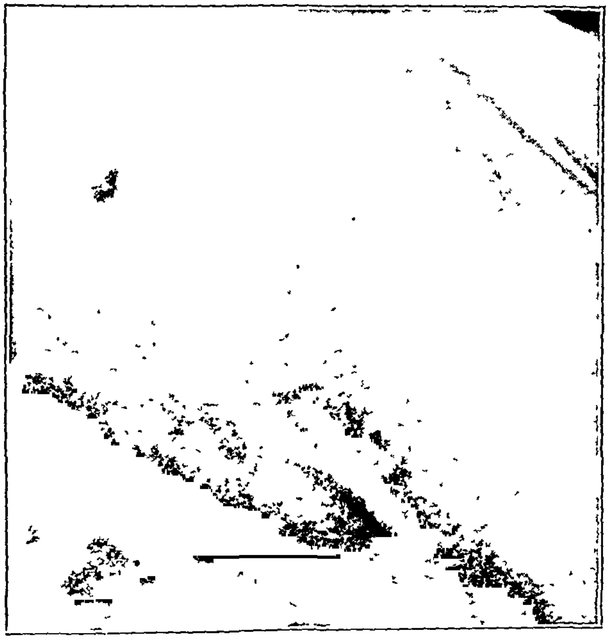

Fig. 2.—Primary lesion on the left arm in crusted stage

c. Sweats: Sweats usually followed the chills; they were drenching in character.

d. Headache: Headache occurred in 90 per cent of the cases. It was often severe. Most frequently it was located in the frontal area, many patients complaining of pain in back of the eyeballs. However, pain in the occiput and at the nape of the neck was a frequent complaint.

e. Muscular Pain: Backache and general soreness of the muscles, as in grip, were common complaints early in the disease.

f. Lassitude: Lassitude was always present and was expressed as a feeling of tiredness and a lack of desire to get out of bed.

g. Photophobia: Photophobia was not an infrequent symptom. Some patients complained of the bright light and wanted to have the shades drawn. Occasionally a mild conjunctivitis was present at the same time. Photophobia was never as severe or as common as it is in measles.

h. Other Symptoms: Occurring rather infrequently were anorexia, dryness of the throat and nausea. Four patients complained of vomiting, 2 of vertigo, 1 of tachycardia and 1 of constipation.

Table 1.—*Site and Incidence of Initial Lesions in Ninety-Six Cases of Rickettsialpox*

Part of Body	No. of Cases	% of Total	Part of Body	No. of Cases	% of Total

Perineum	1	1.0			

Table 2 lists the symptoms by the frequency of occurrence.

3. *Rash.*—A rash appeared in all cases and was noticed most commonly at the onset of fever or one or two days later. In some cases it was not observed until the third or fourth day, and in a few it was not detected until six days later (table 3). The lesions were maculopapular, discrete and erythematous. The papules were usually either flat or curved but occasionally were acuminate. They were firm to the touch. The base was roughly circular, and the area of skin immediately around it was sometimes erythematous. The diameter of the lesions varied from 2 to 8 mm. After a day or two a vesicle developed in the summit of the papule. The vesicle was firm and gave the appearance of a window framed in the top of the papule. When the vesicles dried a black crust was formed, which ultimately fell off without scar formation. In a few patients the papular character of the rash predominated, but in most the vesicular element was most pronounced (fig. 3). The number of lesions in different patients varied. In some the lesions

were scanty, in others moderate in number and in still others they were abundant. There was no pattern in the distribution of the rash. In some patients it was first seen on the arms or legs, in others on the abdomen, back, chest or face. In 2 instances lesions were seen on mucous membranes—once on the palate and once on the tip of the tongue (fig. 4). The rash was not observed on the palms or soles. No subjective symptoms accompanied the rash; there was no itching and no pain. In 73 per cent of the cases the duration of the rash was four to seven days; in the mildest cases the rash did not last more than two or three days, while in some of the more severe cases it lasted as long as ten days (table 3).

4. *Physical Signs.*—Except for the fever and the rash there were no unusual physical signs. The patient did not appear acutely ill in spite of his symptoms; there was no dehydration, and food and drink were taken without coaxing. The patient was alert and cooperative. The pulse rate usually varied with the temperature. The respiratory rate was normal. Heart and lungs were normal on physical and roentgenologic examination. An enlarged spleen was felt in only a few cases, and general lymphadenopathy was also uncommon.

Table 2.—*Frequency of Occurrence of Symptoms in One Hundred and Forty-Four Cases of Rickettsialpox*

Symptoms	Frequency of Occurrence	
	No.	%
Fever	144	100

5. *Prognosis.*—All patients recovered without complications.

LABORATORY DATA

1. *Blood Counts.*—Red blood cell counts and hemoglobin determinations were normal. White blood cell counts showed a moderate leukopenia in 21 of 22 cases reported on, varying between 2,400 and 7,500 white blood cells per cubic millimeter. The differential smear was frequently normal but occasionally indicated a relative lymphocytosis. The leukopenia usually lasted during the acute illness, returning to normal about two weeks after the onset of fever. In 1 patient a count of 3,200 white blood cells per cubic millimeter persisted for about a month after recovery.

2. *Urinalyses.*—Urinalyses were generally normal except for a transient febrile albuminuria.

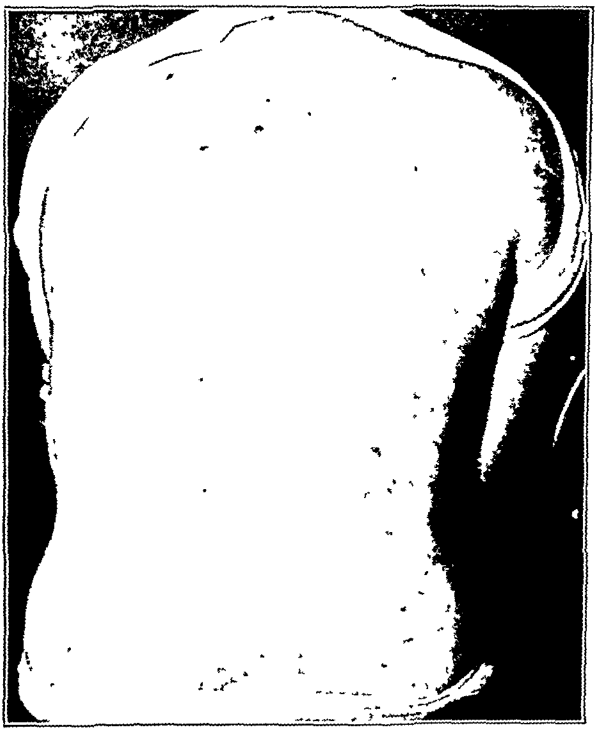

Fig 3 —Rash of rickettsialpox The rash is more pronounced over the lower back and sides

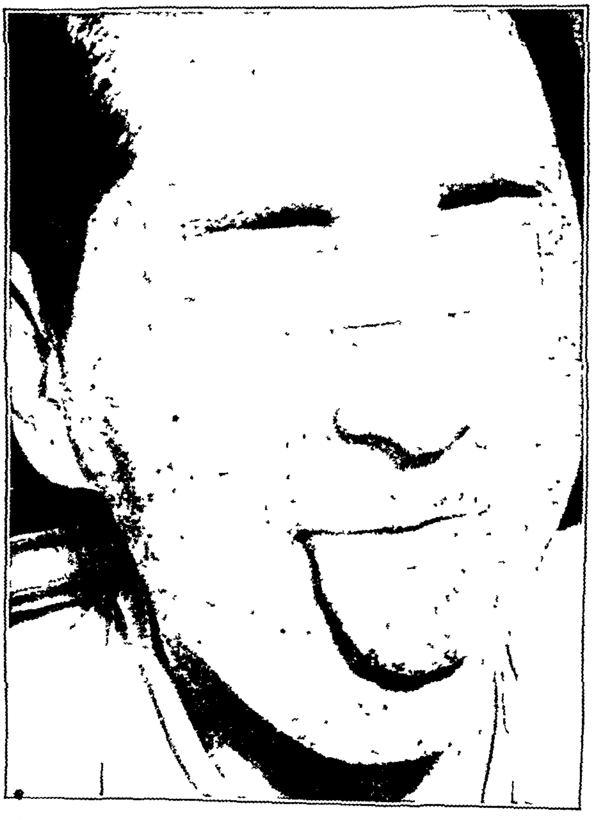

Fig 4 —Vesicular lesions are seen on the tip of the tongue Note also a vesicular lesion on the upper lip and several crusted lesions on the face.

3. *Blood Cultures.*—Early in the disease blood cultures were made in most of the hospitalized patients and in a considerable number of those that remained at home. All were negative.

4. *Sedimentation Rates.*—Tests to determine the sedimentation rates were performed on 7 patients. They were either normal or only slightly elevated.

5. *Serologic Tests.*—Agglutination tests for typhoid bacilli, paratyphoid bacilli A and B, Brucella, Leptospira icterohemorrhagiae, Leptospira canicola and Pasteurella tularensis were done with the serums of 30 samples of bloods obtained from patients both in the acute and convalescent stages. All were essentially negative; agglutination in low dilutions with the O antigen of typhoid was obtained in a few instances. The heterophil antibody test for infectious mononucleosis was likewise negative. Complement fixation tests for psittacosis were done in 5 cases. All were negative. Agglutination tests for Proteus OX 19, OX 2 and OX K were done with the serums of a considerable number of recovered patients. With the exception of a few that agglutinated in low titers all were negative.

PATHOLOGY

Biopsies of a primary lesion, of the lesions due to the rash and of a lymph node were examined at the National Institute of Health and at Willard Parker Hospital. The pathologic picture of lesions of the skin and of a lymph node are considered in the cases reported in this paper. A detailed report on an initial lesion and the later cutaneous lesions will be made in a subsequent note.

DIAGNOSIS

Specimens of blood were obtained from a number of patients in the acute stage of the disease and were inoculated into animals. The recovery of an organism possessing the characteristics of a rickettsia from the tissues of a mouse inoculated with blood drawn from 1 of the patients (M. K.) has been described in the first paper of the series.[1] Antigens prepared from this organism when tested by complement fixation with the serums of normal human subjects and of those who had recovered from endemic typhus, tsutsugamushi fever, Q fever and syphilis all were negative. Tested with serums of patients recovered from Rocky Mountain spotted fever and rickettsialpox, however, the M. K. antigens fixed complement in high titer.

Serums of patients who had recovered from rickettsialpox were tested by complement fixation with the M. K. antigen as well as with the antigen of Rocky Mountain spotted fever. All were positive for the M. K. antigen as were about 80 per cent for the antigen of Rocky Mountain spotted fever, but in lower dilutions. In a few cases in which early and late specimens were obtained from the same patient, significant rises in titer with the M. K. antigen were obtained. Convalescent serums collected between two and three weeks after the onset of fever were usually positive in high dilutions. Some serums obtained as early as a week after the onset of symptoms were positive in low dilutions. Serums were also tested and found negative in the complement fixation test for typhus, Q fever, tsutsugamushi and Colorado tick fever.[4]

DIFFERENTIAL DIAGNOSIS

Chickenpox.—Some of the cases of rickettsialpox seen by us were previously diagnosed as chickenpox or atypical chickenpox, chiefly on account of the vesicular rash. The vesicles are, however, quite different in the two diseases. In chickenpox they are superficial, thin and easily broken, while in rickettsialpox they are deeper and rather firm. Furthermore, the presence of an initial lesion, the occurrence of fever before the onset of rash, the failure to select children for attack and the presence of complement fixing antibodies for rickettsialpox in the serums of convalescent and recovered patients should differentiate rickettsialpox from chickenpox.

Smallpox.—While the pock in the early stage of smallpox resembles that of rickettsialpox, it has a different maturation. It usually becomes pustular and heals to leave a scar. The smallpox rash has a selective distribution, appearing usually on the face, hands and feet. Furthermore, in smallpox there is no initial lesion, and the course of the disease is much severer. There is a prodromal period in smallpox, preceding the onset of fever, when the patient complains of severe headache and backache. Finally, serologic examination of convalescent serums should serve to distinguish the two diseases.

Infectious Mononucleosis.—There should be no difficulty in differentiating this disease from cases of rickettsialpox with lymphadenopathy, since in the former the blood picture is characteristic and the heterophil reaction is usually positive.

Epidemic Typhus.—In epidemic typhus the rash is not discrete and is usually petechial and ecchymotic. No initial lesion is seen. The patients are much sicker, and mortality is high. Nearly all cases give a positive agglutination reaction with Proteus OX 19 and a positive reaction to the complement fixation test with homologous rickettsial antigens.

Endemic Typhus.—In endemic typhus the rash is centripetal in distribution and is either macular or papular but not vesicular. There is no primary lesion. There may be a history of contact with rats. In nearly all cases tests are positive for Proteus OX 19, and the serums give a positive reaction to the complement fixation test with homologous rickettsial antigens.

Rocky Mountain Spotted Fever.—There is a history of tick bite in many of the cases. Rocky Mountain spotted fever is a severer infection, and mortality is high. The lesions are not as discrete and are often ecchymotic, never vesicular. Leukopenia is not characteristic. There is no initial lesion. Most of the cases of Rocky Mountain spotted fever give a positive agglutination reaction for Proteus OX 19 or OX 2. Usually there is a higher titer in a complement fixation test with homologous antigens.

Tsutsugamushi Fever or Scrub Typhus.—The rash in tsutsugamushi fever is macular or maculopapular and not vesicular. The course of the disease is severer and pulmonary signs are common. Serum agglutination with Proteus OX K occurs about the second week in a majority of cases. Specific complement fixation antigens are also available for differentiation.

Boutonneuse Fever.—This disease as described in the literature bears many similarities to rickettsialpox. However, the rash in boutonneuse fever is papular or maculopapular and frequently involves the palms and soles. Serum agglutination of Proteus OX 19 is reported to occur late in the disease or in the convalescent stage. There is a history of association with dogs and of a tick bite.

---

[4] We are indebted to Dr. Herald R. Cox of the Lederle Laboratories for performing some of these tests.

REPORT OF CASES

Case 1.—M. K., a white woman aged 20, born in the United States, was a multigraph operator by profession. She noticed a pimple on her left shoulder on July 17, 1946. It did not pain or itch, and she paid little attention to it. On July 22 she suddenly became ill with severe frontal headache. The following morning she went to work but returned home. That evening she felt feverish, had no desire for food and suffered from a severe headache and pain in the back of the neck. On July 24 she had a chill followed by sweating. Her headache continued to be severe and she felt nauseated but did not vomit. She also had an aching in her thighs, calves and back as in grip, but her head was clear. Her eyes became bloodshot and sensitive. Her temperature was 104 F. She noted a rash on the abdomen. Later that day she also noted spots on her right elbow and on her legs and back. The rash appeared in crops for the next two days. The lesions looked like pimples. On July 25 her throat was somewhat sore. She was admitted to the Willard Parker Hospital on July 26 with a temperature of 103.2 F. and a pulse rate of 100. Her skin was warm and flushed, her eyes were bloodshot, and she complained of sensitiveness to light. She was well oriented and not in acute distress. The blood pressure was 122 systolic and 74 diastolic. On the left shoulder there was a flattened red papule about 1.5 cm. in diameter with a central black crust, or eschar. Over the chest, back, arms, legs and face was a discrete, firm, papular, rose-colored rash. The rash did not pain or itch. Many of the papules were capped with a minute vesicle, and some with a tiny scab. In general the lesions were all in the same stage of development. There was no pronounced adenopathy. A small lymph gland was felt in the left occipital region, one in the left posterior cervical area, a few in the right posterior cervical area and one in the right axilla. The spleen was felt 2 fingerbreadths below the costal margin.

Examination of blood taken the next day showed 3.8 million red blood cells with 66 per cent hemoglobin, 5,000 white blood cells, with 43 per cent polymorphonuclears, 50 per cent lymphocytes, 4 per cent mononuclears, 2 per cent eosinophils and 1 per cent basophils. Urinalysis showed no albumin or sugar but an occasional hyaline cast. Nose and throat cultures were positive for Staphylococcus aureus and hemolytic streptococci. The Kline test was negative, as was the heterophil antibody reaction. The blood culture was sterile. The stool culture was negative. The icteric index was 10. The blood cholesterol was 137 mg., the sugar 90 mg., the chlorides 406 mg. and the nonprotein nitrogen 29 mg. per hundred cubic centimeters. The total serum protein was 6.6 Gm., of which albumin was 4 Gm. and globulin 2.6 Gm. per hundred cubic centimeters. The serum was negative in agglutination tests with typhoid bacilli, paratyphoid bacilli A and B, Past. tularensis, Brucella, and Proteus OX 19 antigens. Roentgenologic examination of the lungs and heart and an electrocardiogram were normal. The sedimentation rate was 19 mm. in one hour. The course of the temperature is shown in figure 5. The examination of the blood on July 29 showed 4.0 million red blood cells with 73 per cent hemoglobin, 8,450 white blood cells with 47 per cent polymorphonuclears, 45 per cent lymphocytes, 6 per cent mononuclears, 1 per cent eosinophils and 1 per cent basophils. Urinalysis showed a slight trace of albumin. On July 31 the blood count was 4.1 million red blood cells with 73 per cent hemoglobin, 8,200 white blood cells with 49 per cent polymorphonuclears, 45 per cent lymphocytes, 3 per cent mononuclears and 3 per cent eosinophils. The blood serum on this day agglutinated Proteus OX 19 in a dilution of 1:20 and also agglutinated the O antigen of Eberthella typhosa in the same dilution.

The patient's symptoms had abated by July 29; the spleen was no longer felt, and the rash was gone except for a brownish staining. The lesion on the shoulder was still present but fading. She was discharged on July 31, 1946.

Specimens for biopsy were taken from one of the cutaneous lesions and from a lymph node. The report of the microscopic examination by Dr. Vera Dolgopol of Willard Parker Hospital follows:

> Sections of the skin show a number of small and large mononuclear collections around the blood vessels, particularly near the sebaceous glands. The endothelium of the capillaries is swollen and bulges into the lumen without completely obstructing it. A few strands of fibrin in the lumen of superficial capillaries are seen in one section. The perivascular cellular collections consist of cells with pale nuclei like those of endothelium of lymphangitis and rather numerous mast cells. The latter are also present around the hair shaft and around a few sweat glands and are scattered here and there in the derma. No rickettsia-like structures are seen. A few dilated lymphocytes are filled with protein and show no endothelial swelling.
>
> The lymph node shows a great hyperplasia of the reticulum cells in the cortex. The small blood vessels in the cortex and in the hilus are numerous and are lined with pale, tall cuboidal endothelium. Their lumen is decidedly narrowed. Mast cells are numerous; a few eosinophils are present.

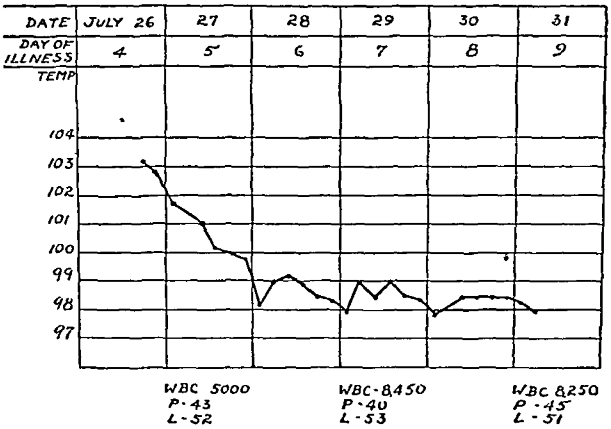

Fig. 5.—Temperature (F.) curve in case 1. WBC, white blood cell count; P, per cent of polymorphonuclears, and L, per cent of lymphocytes.

A specimen of blood taken from M. K. on July 26 was inoculated into laboratory animals. A rickettsial organism was recovered[1] from 1 of 4 mice inoculated. Blood serum obtained on August 29 gave a positive complement fixation result with an antigen prepared from this organism in a dilution of 1:512. The complement fixation test was also positive with Rocky Mountain spotted fever in a dilution of 1:256. Agglutination tests were negative with Proteus OX 19, OX 2 and OX K.

Case 2.—H. B., a white man aged 34, born in the United States, noted a papule on his right shoulder on July 17, 1946. There were no subjective symptoms. On July 24 he stated that he had a "grippy feeling," a severe headache in the occipital region and a tight feeling in the nape of the neck. The next day he took to bed, had a chill, and his temperature rose to 103 F. After the chill he perspired profusely. He complained of headache and backache. The chills recurred, and the temperature fluctuated between 103 and 100 F. He felt grippy and was nauseous but did not vomit. On July 26 a rash appeared on his body. The following day he was admitted to Willard Parker Hospital with a temperature of 102.8 F. and a pulse rate of 100. The lesion on the shoulder, a red papule with central necrosis, was about 1.5 cm. in diameter. On his chest, abdomen, arms and back were a few scattered, red macules and papules, some of the latter surmounted by a vesicle. The cervical lymph nodes were palpable; the axilla and inguinal nodes were slightly enlarged. The spleen was felt just below the costal margin. The blood pressure was 118 systolic and 78 diastolic.

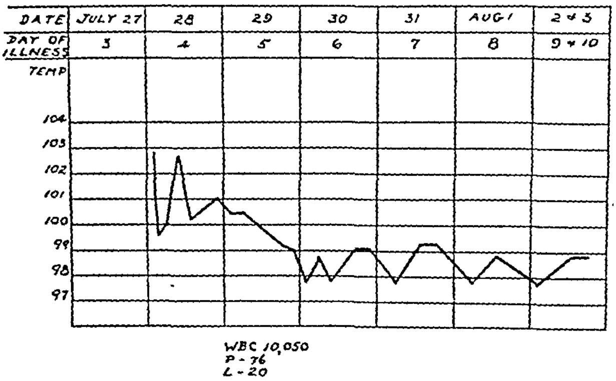

Fig. 6.—Temperature curve in case 2.

Examination of the blood on July 29 showed 10,050 white cells with 76 per cent polymorphonuclears and 20 per cent lymphocytes; there were 4.3 million red blood cells. Urine and stool cultures, the Wassermann test and the heterophil antibody reaction were negative. The icteric index was 16. The blood sugar was 99 mg., the nonprotein nitrogen 20 mg., the cholesterol 197 mg. and the chlorides 421 mg. per hundred cubic centimeters. The serum protein was 5.6 Gm., of which albumin was 4 Gm. and globulin 1.6 Gm. per hundred cubic centimeters. Roentgenologic examination of the lungs and heart was negative. The serum agglutination test was negative for typhoid bacilli, parathyroid bacilli A and B, Brucella, Past. tularensis and Proteus OX 19. A biopsy of a cutaneous lesion was taken. Microscopic examination showed a vasculitis, a frequent observation in rickettsial diseases. No rickettsias were found. The temperature curve is shown in figure 6. By July 30 his temperature had returned to normal and his symptoms were gone, the rash leaving brownish yellow discolorations. The spleen was no longer felt. Blood serum obtained August 18 gave a positive complement fixation test with antigen from the patient M. K. in a dilution of 1:320 and with Rocky Mountain spotted fever antigen in a dilution of 1:80. The serum agglutination test was negative with Proteus OX 19, OX 2 and OX K.

Case 3.—R. R., a white woman, a housewife aged 50 and born in Russia, had lived for the past forty years in the United States. On July 26 she had a chill and noted a temperature of 101 F. She also complained of backache and photophobia. After the chill she had a profuse sweat. Chills and sweats recurred, and her temperature for the next four days ranged between 101 and 102 F. She first noted a rash on her chest on the day of onset of fever; it spread to her face and arms. At no time did she see an initial lesion, but she did note swelling of the right inguinal glands. She was admitted to Willard Parker Hospital on Aug. 30, 1946. She had a temperature of 100.2 F. and her pulse rate was 82. A maculopapular rash with beginning vesiculation, rather sparse in distribution, was seen on the face, chest and arms. A small papular lesion was present on the right side of the hard palate. This later increased in size and became vesicular. No initial lesion was observed on admission. Later, however, a lesion was found on the lower part of the right side of the abdomen, which had the appearance of an initial lesion; it was hidden by the pubic hair.

Examination of the blood showed 4 million red cells, with 70 per cent hemoglobin, and 6,250 white cells, with 71 per cent polymorphonuclears, 23 per cent lymphocytes, 5 per cent mononuclears and 1 per cent basophils. When the white blood cell count was repeated on August 3 it showed 5,700 cells with 63 per cent polymorphonuclears, 26 per cent lymphocytes, 6 per cent mononuclears and 5 per cent eosinophils. On August 5 the white blood cell count was 7,000, with 49 per cent polymorphonuclears, 36 per cent lymphocytes, 12 per cent mononuclears, 2 per cent eosinophils and 1 per cent basophils. The sedimentation rate was 10 mm. in one hour. Roentgenologic examination of the heart and lungs was negative and so was the electrocardiogram. Nose and throat cultures were positive for diphtheroids and Staph. aureus. The vaginal smear was negative. Urinalysis disclosed a slight transient albuminuria. The heterophil reaction was negative. The blood culture and stool culture were negative. The blood sugar determination was 91 mg., the nonprotein nitrogen 32 mg. and the chlorides 297 mg. per hundred cubic centimeters. The icteric index was 12. The total serum protein was 4.1 Gm., of which albumin was 3.28 Gm. and globulin 0.82 Gm. per hundred cubic centimeters. Serum agglutinations with typhoid bacilli, paratyphoid bacilli A and B, Brucella, Proteus OX 19 and Past. tularensis were negative. The patient's fever continued until August 2 (fig. 7) and she was discharged on August 5. Her symptoms had cleared, and the rash had completely disappeared. At no time was the spleen felt.

COMMENT

Two papers describing this disease have been published.[5] Additional cases have been brought to our attention by other physicians in New York, who have reported seeing similar cases over a period of years. The diagnoses at the time were usually atypical chickenpox or fever and rash of unknown origin.

The isolation of rickettsias from the blood of patients[1] and from Allodermanyssus sanguineus (Hirst), ectoparasites of mice[3a] establishes the etiology and strongly indicates the method of transmission of the newly recognized disease. The complement fixation test using antigens prepared from the causative organism provides a serologic aid to diagnosis.

SUMMARY

The clinical features observed in 144 cases of rickettsialpox, a new disease of rickettsial origin, are described. It is characterized by the appearance of an initial lesion about a week before the onset of fever, chills, sweats, headache and backache, and by the appearance of a maculopapular and papulovesicular rash about three to four days after the onset of fever. Except for leukopenia, routine laboratory findings are generally negative. The usual bacterial agglutination tests are uniformly negative; however, antibodies for rickettsialpox are demonstrable by means of the complement fixation test. There have been no deaths.

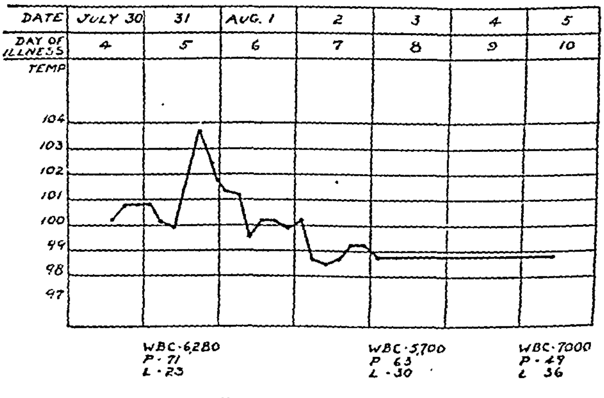

Fig. 7.—Temperature curve in case 3.

The value of the prophylactic use of the sulfonamide compounds and penicillin in traumatic surgery was conclusively demonstrated during World War II. The mortality rate of battle casualties admitted to the general hospitals in England from the period following the invasion of France to the end of the war was approximately 1 per 1,000. In base hospitals of the same character during World War I the mortality rate varied from 2 per cent to 6 per cent. Part of this sharp reduction in death rate can be attributed to the improved system of evacuation, to the excellent immediate surgical treatment and to the free use of blood and plasma, but most of it was due to the astonishing absence of infection. Every wounded soldier, practically regardless of the size or character of his wound, routinely received penicillin and sulfadiazine prophylactically. There can be little doubt that this preventive therapy was primarily responsible for the relative infrequency of infection of wounds. It is reasonable to suppose that if a similar regimen were followed in every type of major surgical operation in which infection may play a deleterious role, there would be a similar overall reduction in the death rate. Many observers have reported the benefits of such treatment in many varieties of surgical procedures. Many surgeon, however, hesitate to subject all their surgical patients to a rather stereotyped regimen of prophylactic therapy.

The purpose of this paper is to report the results of the routine systemic administration of penicillin and sulfadiazine in a series of patients operated on for acute appendicitis in the Cook County Hospital. The circumstances permit fairly accurate investigation. In a charity hospital there is sufficient mortality from appendicitis on which to draw conclusions. The death rate has been fairly uniform over a period of years. The operations are performed largely by the resident staff. The type of patient, the duration of symptoms, the indications for surgical intervention and the general technic have remained the same for many years. No alteration of any kind was made in the care of appendicitis except the introduction of the routine use of penicillin and sulfadiazine.

Twenty thousand units of penicillin were given intramuscularly with the preoperative medication. This was followed postoperatively by 20,000 units of penicillin every three hours for four days, a total of 660,000 units. The patients also received 1 Gm. of sulfadiazine four times a day for four days postoperatively. If the patient was unable to tolerate oral medication, 5 Gm. of sodium sulfadiazine in 1,000 cc. of isotonic solution of sodium chloride or 5 per cent dextrose solution was given daily by the intravenous route. In children the dosage of penicillin was the same as in adults, but the dosage of sulfadiazine was reduced in proportion to the age of the patient. Clear fluids were allowed soon after the operation unless the patient was vomiting or the abdomen was distended. If the patient was unable to take an adequate amount of fluid orally the fluids were given intravenously to make a total fluid intake of 3,000 cc. a day.

The regimen was followed in 108 consecutive patients who had an appendectomy for acute appendicitis. All cases in which the appendix did not show definite evidence of inflammation or which the pathologist reported as acute catarrhal appendicitis were discarded. The remaining 108 cases were classified as follows: (1) acute suppurative appendicitis, 62 cases; (2) acute gangrenous appendicitis, 17 cases, and (3) perforated appendicitis, 29 cases. There were 77 adults, of whom 55 were men and 22 were women, and 31 children, of whom 22 were boys and 9 were girls. There was only 1 death in the series. This patient was a middle aged obese woman with hypertension, severe diabetes and symptoms of five days' duration. She died twenty-four hours after an appendectomy for a gangrenous appendicitis in a diabetic acidosis that did not respond to insulin treatment.

Table 1 shows the death rate following appendectomy for years 1928 to 1932 as 7.6 per cent; for 1937 and 1938 as 3.9 per cent, and for 1944 and 1945 as 4.3 per cent, as compared with a mortality of approximately 1 per cent in this present series. To compare our series of only 108 cases against the much larger numbers of the previous years subjects the conclusions to some statistical error. The improved financial condition of the community at large has reduced sharply the number of admissions to the hospital, and to obtain a comparable series will take many more years. The difference in mortality is large enough, however, to justify some conclusion. In order to check for a statistical error, we sampled 100 consecutive cases for 1932 and another 100 for 1944 and found the mortality practically the same as that reported for the entire year. To complete the picture it must be stated that during the period in which our series was collected there were 35 patients admitted to the hospital with a diagnosis of acute appendicitis, on whom no surgical operation was performed. Of this group, 4 entered in a moribund condition and died within twenty-four hours. Postmortem examination proved that 2 died of acute appendicitis; the other 2 very likely died of acute appendicitis also. The remaining 31 patients who left the hospital without surgical intervention may or may not have had acute appendicitis.

Table 1.—*Comparative Mortality Following Appendectomy*

Years	No. of Cases	Mortality %
1928-1932	2,857	7.6
1937-1938	2,094	3.9
1944-1945	592	4.3
March 1946-October 1946	108	0.9

In addition to a reduction in mortality there was a concomitant observable reduction in morbidity. It was our opinion that the patients were more comfortable, had less abdominal pain and less abdominal distention and were able to tolerate a full diet at an earlier date. The abdomen was usually soft and relatively nontender.

Usually the temperature did not rise after the second postoperative day. In 75 per cent of the cases of acute suppurative and acute gangrenous appendicitis without perforation, the temperature was normal by the end of the third postoperative day. In 50 per cent of the cases of perforated appendicitis the temperature was

---

From the Hektoen Institute for Medical Research of the Cook County Hospital, the Surgical Department of the Cook County Hospital, the Cook County Graduate School of Medicine and the Surgical Department, University of Illinois College of Medicine.

normal by the sixth postoperative day. Nine children ran a low grade fever fluctuating from 101.8 F. to normal for ten days. Four of these patients had drains inserted to or into the peritoneal cavity at the time of surgical intervention.

In the past the majority of patients with perforated appendicitis had considerable postoperative ileus with abdominal distention. Only 1 patient in this series had a paralytic ileus severe enough to warrant the use of Wangensteen suction. In 1 patient the appendicitis was erroneously diagnosed as an empyema of the gallbladder. A large enema given preoperatively perforated the appendix and passed into the free peritoneal cavity. Approximately 1,000 cc. of the soapsuds enema was recovered from the abdomen. The patient made an uneventful recovery without abscess formation.

Three cases of intra-abdominal abscess and 1 case of pelvic abscess were observed in this series. These abscesses subsided spontaneously on the continuation of the routine administration of penicillin and sulfadiazine. The masses became less tender, smaller and then disappeared, the temperature gradually dropped to normal, and the patients were discharged by the twenty-first postoperative day. There were 9 instances of wound infection. In 5 of these, drains were inserted at the time of the surgical operation. The use of penicillin and sulfadiazine seemed to prevent the development of severe infection in the wounds. In the infected wounds there was also an apparent absence of local tissue reaction, as evidenced by a minimal amount of pain, tenderness, heat and swelling of the surrounding tissues.

TABLE 2.—*Average Postoperative Hospital Stay in Days*

Pathologic Data	1935	1944	1946
Suppurative appendicitis	12.1	11.0	7.9
Gangrenous appendicitis	17.5	12.0	8.0
Perforated appendicitis	19.6	19.7	11.7

Table 2 shows the average hospital stay in days for 100 consecutive patients with appendectomies in 1935 and in 1944 as compared with that for 108 treated by the prophylactic use of penicillin and sulfadiazine. There was a definite reduction in the duration of hospitalization. Since no organized effort was made to send the patients home at an early date this indicates in general a shorter and less complicated convalescence.

COMMENT

Although there can be little doubt that prophylactic chemotherapy reduces the mortality in appendicitis, it is difficult to state what type of chemotherapy is most effective.

Bower[1] and his associates made the first attempt to reproduce the mixed type of peritoneal infection seen in appendical peritonitis. They found a substantial reduction in the mortality of experimental animals after the administration of the azosulfamide "prontosil."

More recently Fauley[2] and others have shown that penicillin is effective in controlling the peritonitis induced in dogs by ligation of the appendix and its blood supply. The mortality in untreated controls was 92.6 per cent, with an average survival time of fifty-seven hours. There was no mortality in those dogs that were treated from the time of surgical intervention. When penicillin therapy was delayed twelve hours the mortality was 21 per cent.

Murphy[3] and his associates have reported an evaluation of streptomycin therapy in experimental peritonitis produced by the technic that was introduced by Bower[1] and modified by Fauley[2] and his co-workers. They have established that subsequent to intramuscular injection streptomycin is present in significant amounts in the peritoneal fluid of normal dogs as well as dogs with acute diffuse peritonitis. The mortality in untreated controls was 70 per cent. Of 10 animals that were treated with streptomycin, 4 died in forty-nine hours, a mortality of 40 per cent.

There is a large volume of clinical evidence indicative of the effectiveness of chemotherapy in the control of peritonitis. A comparative study of the use of the sulfonamide drugs reported by Ravdin, Rhoads and Lockwood[4] reveals a distinct lowering of the morbidity and mortality of appendicitis. Stafford[5] has used sulfathiazole in a dosage necessary to maintain a blood level of 6 to 8 mg. in 105 cases of peritonitis and abscess of appendical origin, with a lowering of the mortality from 10 to 4.76 per cent. Many investigators have reported similar experiences with the use of sulfanilamide and its derivatives.[6]

The value of the prophylactic use of penicillin in traumatic injuries of the abdomen was conclusively demonstrated in World War II. Imes[7] has reported a distinct lowering of the mortality in peritonitis with no instance of a diffuse suppurative process during the Italian campaign. Crile,[8] Palmer[9] and Wollgast[10] have concluded that penicillin in massive doses has a definite effect in the control of peritonitis due to appendicitis or perforation of the large bowel. Crile[11] has stated that large doses of penicillin are necessary to control the peritonitis secondary to appendicitis and has reported no mortality in 50 patients so treated. We believe that it is not necessary to have a dosage greater than 20,000 units of penicillin intramuscularly every three hours solely for prophylactic purposes. Sulfonamide therapy was used in conjunction with penicillin in order to obtain as wide a range of bacteriostatic effect as possible.

It is not our contention that the indicated regimen is the most advisable one; we are of the opinion that routine prophylactic chemotherapy of this type is definitely beneficial and that a similar regimen would be equally effective subsequent to any laparotomy in which contamination or infection plays a role in mortality or morbidity.

SUMMARY

Penicillin and sulfadiazine were routinely administered to 108 patients operated on for acute appendicitis. No alteration of any kind was made in the care of appendicitis except the introduction of prophylactic chemotherapy.

In addition to a definite reduction in mortality, there was a concomitant reduction in morbidity. The patients were more comfortable, had less abdominal pain and less abdominal distention and left the hospital at an earlier date.

CHRONIC SUBCLINICAL IMPAIRMENT OF THE LIVER

Early Diagnosis and Treatment

Further Improvement and Evaluation of Certain Liver Function Tests

Up to the present time the diagnosis and treatment of chronic impairment of the liver in its early subclinical stages have not been practiced to any degree by the members of the medical profession. The main purpose of this communication is to outline a reliable and simple method for such early diagnosis, evaluation and treatment of chronic impairment of the liver in a stage prior to the appearance of clinical evidence. The fact that a relatively effective method is available for the treatment of acute or chronic impairment of the liver makes it especially important to detect and evaluate chronic hepatic impairment in its early stages, when intensive treatment may prevent the development of advanced chronic hepatitis and cirrhosis. Also, the recent development of much more sensitive tests now makes it possible in all probability to prevent the indefinite persistence in most cases of residual chronic hepatitis following acute hepatitis. These tests allow detection and follow-up observations of such residual hepatitis and thus insure the continuation of intensive treatment for a period of months, if necessary, or until the more sensitive tests have become negative. The earlier detection and treatment of acute hepatitis now are also feasible if the possibility of this condition is considered in the preicteric stage of malaise and anorexia and if the more sensitive tests are conducted at this time.

Until recent years the criticism has been leveled against liver function tests that they were so lacking in sensitivity that clinical evidence of hepatic disease usually was present before the tests became positive. During recent years, with the further development of liver function tests, some of which are three times as sensitive as the former Rosenthal sulfobromophthalein sodium (bromsulphalein) test, a contrary criticism directed toward some of the newer tests has been that they are too sensitive and may indicate only impairment of hepatic function without impairment of structure. In this article we outline a method of interpreting the positive results of these more sensitive tests and of demonstrating probable evidence as to whether or not morphologic impairment of the liver exists in such cases.

In the selection and employment of the more sensitive liver function tests, the all important point is that they should be reliable and not yield false positive results on normal persons. To insure this, the essential consideration is that correct normal standards should have been determined for the technic of these tests. We have been particularly interested in checking the normal standards for the more important tests and in advocating a change in standard whenever it was clearly indicated, as, for example, in the case of the sulfobromophthalein test and the thymol turbidity test. In four recent publications [1] we have summarized the results of these studies on normal standards, as well as of detailed studies on the relative sensitivity of the newer tests. The advantages and limitations of each of these tests have also been noted, as well as the incidence of various positive tests in different types of hepatic disease.

The newer tests which we have studied and evaluated in detail have been the forty-five minute 5 mg. per kilogram photoelectric sulfobromophthalein test as recently developed in this clinic,[2] Hanger's cephalin-cholesterol flocculation test [3] as modified by Neefe and Reinhold,[4] the oral hippuric acid test of Quick [5] as modified by Boyce and McFetridge,[6] the intravenous hippuric acid test of Quick,[7] the thymol turbidity test of Maclagan [8] and the associated thymol flocculation test recently suggested by Neefe.[9]

Six additional liver function tests employed to advantage in this clinic are (*a*) the blood prothrombin determination after vitamin K administration as advocated by Ivy,[10] (*b*) the serum albumin and globulin determinations as evaluated by Tumen and Bockus,[11]

In order to obtain the maximum amount of valuable information from the employment of liver function tests we have thought it worth while to provide also an outline of the particular subgroups of tests which are best adapted to the study of different types of hepatic problems.

The all-important evidence is outlined for the validity of the diagnosis of chronic subclinical impairment of the liver.

TESTS OF DIFFERENT SENSITIVITY IN SUBCLINICAL IMPAIRMENT OF THE LIVER

The old teaching that the results of liver function tests should be interpreted in conjunction with the clinical observations is still correct, if clinical evidence is present. However, hepatic impairment should be diagnosed and treated before clinical evidence becomes apparent, and it is with the early diagnosis and therapy of the disease that this communication is concerned.

TABLE 1.—*Therapeutic Response in Ninety-One Cases of Subclinical Impairment of the Liver*

(Results of Sensitive Tests Before and After Treatment *)

Tests	Before Treatment		After Treatment: Percentage of Cases with Positive Tests Which Have Now Become Negative †
	No of Cases	Positive Tests	
Cephalin cholesterol ..	91	66	67% of 66
Sulfobromophthalein .	91	33 ‡	70% of 33
Thymol turbidity	91	24 §	58% of 24

* The average period of treatment was four and one half months. Variation in the period of treatment was two weeks to fifteen months

† Only in occasional cases in this treated group did the tests become more positive in spite of treatment

‡ The apparent lesser sensitivity of the sulfobromophthalein test noted *here is due to the fact that in the great majority of cases the cephalin* and thymol tests were used as the screening tests for selection of these patients for treatment. The sulfobromophthalein test was then conducted on those patients who had yielded a positive cephalin or thymol test

§ The great majority of these thymol turbidity tests were performed with the less sensitive p_H of 7 8, which has been employed until recently.

Although different liver function tests do test different functions, and a "less sensitive" test may be positive in a particular case in which a "more sensitive" test is negative, nevertheless, in a group of 100 cases one test will consistently yield a larger proportion of positive reactions than another and is, therefore, relatively more sensitive. The determination of relative sensitivity will be discussed later in more detail.

In the initial attempt to determine the degree of impairment of the liver after positive results have been obtained with the more sensitive screening tests (such as the cephalin test, the thymol tests with a p_H of 7.55 or the previously mentioned type of sulfobromophthalein test), the second indicated step is to conduct certain of the less sensitive tests, for example, the oral hippuric acid test. If these less sensitive tests are definitely positive, one is obviously dealing with at least a moderate degree of morphologic impairment of the liver. If these latter tests are negative, one is obviously dealing with early impairment of the liver, either impairment of function alone or definite early organic impairment This latter differentiation must be made by a third method of approach, a therapeutic test.

THE VALUE OF A THERAPEUTIC TEST

In those cases without clinical evidence of hepatic disease in which only the more sensitive liver function tests are positive, do such positive findings indicate impaired hepatic structure or only impaired hepatic function?

In an attempt to answer this question, 91 subclinical cases with this type of positive data have been subjected to a therapeutic test with intensive liver therapy. The value of such a therapeutic test was emphasized in our recent publication.[1c] The time required for reactions to the more sensitive tests to return to normal values in these cases has varied all the way from seven days to fifteen months, and some of the tests are still positive. This wide variation of response constitutes most valuable information, since it measures the magnitude of the therapeutic problem in each particular case; and the therapeutic test insures the initiation of early and effective treatment. As to the value of this varied therapeutic response in the interpretation of these positive tests, it is reasonable to believe that there is probably only an impairment of hepatic function in those patients whose reactions to tests return to normal after a relatively short period of treatment, e. g., a week or ten days. On the other hand, in those cases in which months of intensive treatment are required before responses to these sensitive tests finally return to normal, one is practically forced to believe that there must have been impairment of hepatic structure as well as of hepatic function, even though no demonstrable clinical evidence of disease of the liver had yet developed. In the intermediate group of therapeutic time responses, we do not yet know just where to draw the line of demarcation between functional and organic impairment. Only time and further study, preferably with correlation of hepatic biopsy findings (as they become available) with the results of various tests and with the time factor in therapeutic response, will refine further the interpretation of the more sensitive tests in this intermediate group of subclinical cases. Meanwhile, an important advance will be made if there becomes prevalent with medical practitioners the practice of routinely instituting an intensive therapeutic test in this whole group of subclinical cases which yield positive results with the more sensitive tests but *in which clinical evidence of* disease of the liver has not yet developed.

The detailed results of the therapeutic response of these 91 subclinical cases are outlined in tables 1 and 2 (see footnotes of table 1).

VALIDITY OF DIAGNOSIS OF CHRONIC SUBCLINICAL IMPAIRMENT OF THE LIVER

That the foregoing group of cases in tables 1 and 2 do represent true instances of subclinical hepatic impairment (of structure in most cases and of function alone in others) seems evident because:

1. We have now had sufficient experience with the sulfobromophthalein, cephalin and thymol tests in following the clinical progress of patients with well defined and known disease of the liver to note the consistent and persistent correlation of the varying results of the tests with the progress of the disease.

2. When these more sensitive tests have been performed in the presence of a vast variety of diseases other than primary disease of the liver they tend to be negative, except for a few well known exceptions with the cephalin test or for positive reactions to liver function tests in patients having acute infections or other diseases which have a known tendency to produce secondary impairment of hepatic function.

3. The positive results obtained with these more sensitive tests tend to return to normal in response to specific and intensive liver therapy.

In establishing this subclinical group of cases the absolute necessity of using correct normal standards for the tests is obvious.

FURTHER STUDIES ON NORMAL STANDARDS OF LIVER FUNCTION TESTS

Using 40 normal young adults (25 to 35 years of age), earlier normal control studies[1] have been conducted previously on the 2 mg. per kilogram twenty minute sulfobromophthalein sodium method, the 5 mg. per kilogram forty-five minute comparator block and photoelectric sulfobromophthalein methods, Hanger's cephalin-cholesterol flocculation test (with Neefe's modification), the intravenous hippuric acid test and the thymol turbidity test. Either the normal standards suggested by the authors of these tests have been confirmed or an alteration has been suggested and the reasons outlined. In determining correct normal standards one should emphasize first the reliability of the test, with avoidance of false positive results; sensitivity should be considered second.

More recently, since Neefe[9] reported his development and evaluation of the thymol flocculation test as a simple supplement to the thymol turbidity test we have been interested in its use and appraisal. Our studies on 40 normal serums confirm his statement that with normal serums flocculation either does not occur or is not more than 1 plus. Since 95 per cent of our normal serums yielded no flocculation in eighteen hours with the more sensitive thymol buffer solution of p_H 7.55 referred to later on and only 5 per cent yielded 1 plus flocculation, any eighteen hour reading of 2 plus, 3 plus or 4 plus flocculation indicates some impairment of hepatic function.

As noted in our previous studies, when using Neefe's modification[4] of Hanger's cephalin-cholesterol flocculation test,[3] any result of 2, 3 or 4 plus flocculation indicates some impairment of the liver's function. (The hypersensitivity and false positive results with the cephalin test are avoided now by keeping the test solutions in a dark place.)

In view of the known effect of light in producing false positive results with the cephalin test, the effect of light on the thymol turbidity and flocculation tests was investigated recently, using the same 40 normal young adults. In these normal control studies with the two thymol tests, false positive results were not obtained when the test solutions were allowed to stand exposed to daylight during the test period. In the case of patients with impairment of the liver, the positive results obtained with the thymol turbidity test exhibited the same degree of positiveness whether the test solution was exposed to light or was kept in the dark. With the thymol flocculation test there were only occasional cases in which the positiveness of the result was slightly increased from 2 to 3 plus or from 3 to 4 plus when the test solution was exposed to light for the longer eighteen hour period.

Normal control studies were recently conducted also on the serums of the same 40 young adults, using the cephalin test, the thymol turbidity and thymol flocculation tests and collecting about half of the blood specimens one to two hours after breakfast and the other half one to two hours after lunch. False positive findings did not result from the ingestion of food before the withdrawal of the blood. In other words, it is apparently not necessary to obtain the blood in the morning when the patient is fasting, although most of our studies have been conducted on "fasting" blood.

TABLE 2—*Illustrative Cases*

Variable Time Required for More Sensitive Tests to Return to Normal with Intensive Liver Therapy (Ninety One Subclinical Cases)

Case	Positive Tests Before Therapy			Period of Therapy Required for Tests to Become Negative			Tests Still Positive (Time Interval)		
1	Cephalin cholesterol 4+			0		7 days			
2	Cephalin cholesteral 2+			0		3 wks			
3	Cephalin-cholesterol 3+			0		5 wks			
4	Cephalin cholesterol 4+			....			4+		28 wks.
5	Cephalin cholesteral 3+			0		27 wks			
6	Cephalin cholesterol 2+			1+		32 wks			
7	Cephalin cholesteral 2+			....			3+		63 wks.
8	Thymol turbidity 3 U.			2 U.		2 wks.			
9	Thymol turbidity 3 U.			1 U.		6 wks			
10	Thymol turbidity 4 U.			2 U.		6 wks.			
11	Thymol turbidity 4 U.			2 U.		10 wks			
12	Thymol turbidity 5 U.			....			3 U.		12 wks.
13	Thymol turbidity 3 U.			0 U.		26 wks			
14	Thymol turbidity 6 U			....			4 U		22 wks
		45 Min.	60 Min	45 Min.	60 Min		45 Min.	60 Min	
15	Sulfobromophthalein	5%	1%	0	0	4 wks.			
16	Sulfobromophthalein	5%	4%	0	0	5 wks.			
17	Sulfobromophthalein	6%	5%	0	0	6 wks.			
18	Sulfobromophthalein	7%	4%	0	0	14 wks.			
19	Sulfobromophthalein	10%	6%	3%	2%	24 wks.			
20	Sulfobromophthalein	7%	4%	. ...			5%	2%	6 wks.

The determination of the correct normal standard for Watson's simplified quantitative urinary urobilinogen test will be discussed later.

FIGURES INDICATIVE OF IMPAIRMENT OF HEPATIC FUNCTION

With the use of correct normal standards, in the case of the eleven liver function tests used in this clinic, the evidence of impairment of the liver's function is outlined in detail in table 3.

SENSITIVITY AND VALUE OF THE THYMOL TURBIDITY AND THYMOL FLOCCULATION TESTS

Our published evaluation of the thymol turbidity test[1c] in cases of gross hepatic disease agrees fairly well with that of Watson and Rappaport[18] and Neefe,[9] in that this test is particularly valuable in cases of acute infectious hepatitis, both in evaluating the degree of hepatitis and in following its course. In cases of hepatic cirrhosis our published statistical studies agree with Watson's experience that the thymol turbidity test is *not positive as frequently as is the cephalin test.*

---

[18] Watson, C. J., and Rappaport, E M.: A Comparison of the Results Obtained with the Hanger *Cephalin Cholesterol Flocculation* Test and the Maclagan Thymol Turbidity Test in Patients with Liver Disease, J. Lab. & Clin Med 30: 983 (Dec.) 1945.

In the recently published results of our study [1c] which compared the sensitivity of the thymol turbidity test with that of the cephalin and sulfobromophthalein tests, the p_H of the thymol buffer solution employed was 7.8, as suggested by Maclagan.[8] With that hydrogen ion concentration it was noted that the thymol turbidity test lacked adequate sensitivity to be of value as a screening test in early chronic cases of impairment of the liver and, also, that it was positive in only 44 per cent of our cases of well developed hepatic cirrhosis. In cases of acute hepatitis with more extensive damage to the liver the thymol buffer solution with a p_H of 7.8 was fairly satisfactory.

More recently we have been using a slightly lower p_H of 7.55 for the thymol turbidity and flocculation tests. The thymol method with this lower hydrogen ion concentration is much more sensitive in detecting impairment of the liver in chronic cases, as we have reported elsewhere,[19] and it is a satisfactory screening test for use in association with the cephalin test. The statistics quoted later (comparing the sensitivity of the thymol tests with that of the cephalin test) were obtained with this lower and more sensitive p_H of 7.55. And yet this p_H of 7.55 is not too sensitive, for no false positive thymol turbidity tests were obtained when the 40 normal serums were tested with the p_H 7.55 thymol buffer solution, and the same normal standard of 0 to 2 units previously determined for the thymol turbidity test with p_H 7.8 was used. In fact 86 per cent of the 40 normal serums yielded results of only 1 unit with p_H 7.55, and no results of more than 2 units were obtained. Also, when the thymol flocculation test was conducted with a p_H of 7.55 on the 40 normal serums (using the normal standards noted previously) no false positive results were obtained. Only an occasional 1 plus flocculation result was obtained (as with the p_H of 7.8), and no 2, 3 or 4 plus results were observed.

TABLE 3.—*Figures Indicating Impairment of Liver Function*

(Using Correct Normal Standards)

1. *A.* 5 mg. per Kg. 45 min. photoelectric sulfobromophthalein method: any 45 min. reading of more than 4% of retained dye
   B. 5 mg. per Kg. 45 min. comparator block sulfobromophthalein method: any 45 min. reading showing any retained dye
2. Cephalin-cholesterol flocculation test: ++, +++ or ++++ results
3. *A.* Thymol turbidity test (p_H of 7.55 or 7.8): 3 U. or more
   B. Thymol flocculation test (p_H of 7.55 or 7.8): ++, +++ or ++++ results
4. Intravenous hippuric acid test: less than 0.70 Gm.
5. Oral hippuric acid test: less than 3.0 Gm.
6. Blood prothrombin after vitamin K: less than 70% of normal
7. Serum albumin: less than 4.0 Gm. per 100 cc.
8. Simplified quantitative urinary urobilinogen test: more than 1.0 U.
Serum bilirubin (*a*) icteric index; reading above 7; (*b*) quantitative indirect van den Bergh: more than 0.8 mg. per 100 cc.
Galactose tolerance test (oral): more than 3.0 Gm.
Total blood cholesterol: more than 220 mg. per 100 cc.; cholesterol esters: less than 60% of total cholesterol

Not only is the thymol method with the more sensitive p_H of 7.55 much more helpful in studying cases of chronic disease than is the p_H of 7.8, but it seems as satisfactory as the p_H of 7.8 in following the progress of cases of acute impairment. In fact, it should prove to be even more helpful than the less sensitive p_H of 7.8 in demonstrating the last trace of residual hepatitis *in the late convalescent stages of acute hepatitis.* A test which never gives false positive results with normal serums cannot be said to be too sensitive. The p_H should not be any lower than 7.55, however, because (1) this is not necessary for adequate sensitivity and (2) a lower hydrogen ion concentration would introduce a risk of false positive results.

As pointed out by Maclagan, the Kingsbury turbidity standard should be checked against diluted serum of known protein content every few months to be sure it is still correct. Even though Maclagan's technic of preparation is consistently followed each time, the hydrogen ion concentration of each freshly prepared thymol buffer solution should be accurately determined and adjusted, since it may vary with different lots of sodium barbital obtained from the same firm.

Our recent experience with the thymol flocculation test indicates that it has definite supplementary value (1) in confirming the positiveness of certain borderline reactions to thymol turbidity tests and (2) in adding to the total sensitivity of the thymol method. Although the cephalin test is still the best screening test for early chronic impairment of the liver, it will be noted from an evaluation of table 4 that the combined thymol turbidity and flocculation tests have an exceedingly important supplementary value as screening tests if the more sensitive p_H of 7.55 is employed. As noted in our recent publication,[1c] the thymol test is not a good screening test if the less sensitive p_H of 7.8 suggested by Maclagan is employed.

EVIDENCE THAT A DIFFERENT CHEMICAL MECHANISM UNDERLIES THE CEPHALIN TEST THAN THAT UNDERLYING THE THYMOL TESTS

Watson and Rappaport [18] reported evidence that there must be a different chemical mechanism for the cephalin test than for the thymol turbidity test, because there was a lack of parallelism in the degree of positiveness of the two tests in identical cases in which both tests were positive. (Watson's cases were well developed examples of hepatic disease, as has been noted previously.) In our recent study of 58 early subclinical cases of disease of the liver (using the thymol method with a p_H of 7.55) the fact that 78 per cent of this group of cases yielded a complete dissociation of positive results with the cephalin and thymol tests points definitely to a different chemical mechanism for these two tests. Neefe [9] has noted recently in a small but important group of cases a dissociation of positive results with the cephalin and thymol tests in the late, posticteric or convalescent stages of acute infectious hepatitis, with concomitant interesting findings in the microscopic pathologic study of the liver in these cases. Hanger and his associates [20] have noted in chemical studies evidence that when the cephalin test is positive there is an alteration from normal in the inhibiting effect of the albumin fraction on the globulin flocculation with the cephalin-cholesterol reagent. The exact underlying chemical basis for the thymol turbidity and flocculation tests is not known definitely and should be studied. It probably involves an alteration in the gamma globulin. That there is a different chemical basis for the two tests seems obvious.

ADVANTAGES OF THE PHOTOELECTRIC SULFOBROMOPHTHALEIN SODIUM (BROMSULPHALEIN) METHOD

I. The advantages of the photoelectric sulfobromophthalein method over the comparator block method are as follows: 1. As pointed out by Gaebler,[2a] the sulfobromophthalein determinations can be made accurately on turbid, hemolyzed or icteric serums. 2. They can be made on as little as 0.5 cc. of serum. 3. Exceedingly small amounts of residual dye can be detected in the serum and accurately measured. 4. Although with 10 per cent or more of retained dye the results obtained by the two methods are comparable, the photoelectric readings are more accurate with any amount of dye.

II. As we have noted in earlier studies,[1c] the photoelectric sulfobromophthalein method in jaundiced patients does measure accurately the amount of dye retained in the serum. Furthermore, it seems to be a reliable index of the degree of impairment of function of the liver in cases of hepatic jaundice, as evidenced by a comparison of these results with those of other tests in a group of jaundiced and nonjaundiced patients. The question has been raised as to whether the sulfobromophthalein test parallels the serum bilirubin test in results obtained in the hepatic type of jaundice. In some cases it does, but in others there is a definite and pronounced dissociation of results. In cases of subclinical hepatic jaundice the photoelectric sulfobromophthalein sodium test seems to be of particular value. Thus far we have noted no evidence of any untoward effect on the damaged liver caused by the injection of the dye. Since this is an excretory test, in obstructive jaundice the retention of dye in the blood stream is due mainly to the obstruction, and it is not a reliable index, therefore, of impaired function of the liver. The test should not be used in cases of obstruction of the biliary duct.

SIMPLIFIED QUANTITATIVE URINARY UROBILINOGEN TEST

Watson's simplified quantitative urinary urobolinogen test of liver function published recently[12] is a test which was not discussed in our previous publications and which merits special comment. It is a simplification of the previous, more elaborate petroleum ether extraction method of Watson and his associates.[21] In the simplified method[12] the results are expressed in terms of Ehrlich units per hundred cubic centimeters of urine instead of in terms of milligrams per hundred cubic centimeters. This test presents the following special advantages: (1) it yields direct and extremely valuable evidence in the differential diagnosis of hepatic and obstructive jaundice, and (2) serial tests are helpful in following the course of acute hepatitis under treatment.

Using Watson's published technic for his simplified urobilinogen test,[12] our laboratory previously conducted the test on 40 normal young adults. With the 2 to 4 p. m. collection of urine, the lowest reading was 0.39 Ehrlich unit and the highest normal result was 2.24 units per hundred cubic centimeters of urine, with every range of variation between these extremes. Any reading of 2.3 units or more per hundred cubic centimeters was regarded, therefore, as indicating impairment of hepatic function. This conclusion corresponded closely with Neefe's normal studies[9] on Watson's test and with Neefe's conclusion that any result of more than 2.5 units per hundred cubic centimeters indicates impairment of the function of the liver. Watson's normal studies, however, showed an upper limit of normal of only 1.0 unit, with rare exceptions of minor degree.

The explanation of this disagreement of results obtained in tests on normal persons has been ascertained. Dr. Watson's laboratory, we have learned recently, adds the acetate immediately after adding the diazo reagent in conducting the test, thus preventing the development of a deeper color, which evidently results only if an interval elapses before adding the acetate. The importance of observing this precaution is emphasized in two current publications by Kelly, Lewis and Davidson[22] and by Watson and Hawkinson.[23]

TABLE 4—*Sensitivity and Value of Thymol Turbidity and Flocculation Tests as Screening Tests if a More Sensitive New p_H of 7.55 Is Employed*

(Comparison with Cephalin Test)

1. In screening over 300 persons 58 subclinical cases of liver impairment were found, yielding positive results with one or more of tests listed previously
   A 33 of 58 subclinical cases presented a positive cephalin test
   B. 18 of 58 cases presented a positive thymol turbidity test
   C 15 of 58 cases presented a positive thymol flocculation test
   D 25 of 58 cases presented either positive thymol turbidity or flocculation tests, or both
   E Therefore, combined thymol tests with p_H 7.55 yielded 76% as many positive tests as did the cephalin test in screening subclinical cases

2 *A.* In 13 of 58 cases both cephalin and thymol tests were positive, viz., one or the other, or both thymol tests
   B. In the other 45 cases either the cephalin test or thymol tests alone were positive (in other words, there was a complete dissociation of positive results with two tests in 78% of 58 cases, indicating the value of using both tests in screening early cases)

3 In a similar analysis of the value of the aforementioned tests in 38 clinical cases (acute hepatitis and cirrhosis) there was a positive cephalin test in 31 cases, and one or both thymol tests were positive in 32 cases; in other words, the combined thymol method exhibited almost exactly the same sensitivity as the cephalin test in this clinical group of cases

4 In a mixed group of 40 cases (clinical and subclinical) the combined thymol tests with p_H 7.55 yielded just twice as many positive tests as did those with p_H 7.8

With this important precaution added to the technic of the test, we have recently studied 40 normal young adults again. The results vary from 0.03 to 0.97 Ehrlich unit per hundred cubic centimeters of urine, with an average reading of 0.46 unit, which corresponds almost exactly with Watson's observations. If the important technical precaution indicated in the preceding paragraph is observed, any reading repeatedly over 1.0 unit should be regarded as indicative of some impairment of the function of the liver.

COMPARATIVE SENSITIVITY OF VARIOUS LIVER FUNCTION TESTS

Valuable information has been obtained from our recent comparative sensitivity studies and from the present study. The relative sensitivity of different liver function tests was determined by noting how many positive results were obtained with different tests in the same groups of cases (of different types). For the details refer to table 5 and previous publications.[1]

---

[21] Schwartz, S., Sborov, V., and Watson, C. J.: Studies of Urobilinogen: The Quantitative Determination of Urobilinogen by Means of the Evelyn Photoelectric Colorimeter, Am. J. Clin. Path. **14:** 598-604 (Dec.) 1944.

[22] Kelly, W. D., Lewis, J. H., and Davidson, C. S.: The Determination of Urine Urobilinogen, J. Lab. & Clin. Med. **31:** 1045 (Sept.) 1946.

[23] Watson, C. J., and Hawkinson, V.: Am. J. Clin. Path., to b published.

In any comparative study of the relative sensitivity of various liver function tests, the more sensitive tests will appear highly sensitive in relation to the less sensitive tests if only early subclinical cases are studied. If only cases of advanced impairment of the liver are studied the less sensitive tests appear much more sensitive in relation to the decidedly sensitive tests, for obvious reasons. Most of our comparative studies reported herein were made on rather large groups of cases, including both many cases of early or subclinical impairment and a still larger group of cases of various degrees of hepatic disease, and with clinical as well as laboratory evidence for the evaluation of results. This representative type of clinical material was used in order to obtain an average estimate of relative sensitivity of these tests. The relative sensitivity of various liver function tests, as noted here, should only be regarded as approximate, since different studies of these tests on apparently similar groups of cases will give similar but not identical results.

TABLE 5—*Comparative Sensitivity of Various Tests*

(Data Obtained from Our Recent Comparative Sensitivity Studies)

1. Most sensitive tests (three times as sensitive as the earlier Rosenthal sulfobromophthalein test)
    - *A.* Cephalin cholesterol flocculation test (modified)
    - *B.* 45 min 5 mg. per Kg. photoelectric sulfobromophthalein test
    - *C.* Intravenous hippuric acid test (these three tests exhibited decided and almost equal sensitivity)
    - *D.* Combined thymol turbidity and flocculation method (p_H 7.55) (yielded 76% as many positive tests as cephalin test in subclinical cases, and 100% as many in mixed clinical group); cephalin and thymol tests have simplest technic
2. Tests with intermediate sensitivity (not equally sensitive)
    - *A.* Oral hippuric acid test (about one half as sensitive as previous tests); of special value in graduating the degree of impairment of the liver
    - *B* Thymol method (less sensitive p_H of 7.8) was about half as sensitive as the most sensitive tests in mixed group of cases of acute hepatitis and cirrhosis; in subclinical cases its relative sensitivity was less than 50% that of the three most sensitive tests
    - *C.* Urinary urobilinogen test
3. Less sensitive group
    - *A* Includes (1) the blood prothrombin after vitamin K, (2) serum albumin determination, (3) oral galactose tolerance test and (4) the blood cholesterol tests (total and esters)
    - *B* The sensitivity of these four less sensitive tests in relation to each other and to the intermediate group of tests varied in acute hepatitis and cirrhosis groups of cases
    - *C.* See table 6 for indications for the use of these less sensitive tests

GROUPS OF TESTS ESPECIALLY ADAPTED TO STUDY OF DIFFERENT TYPES OF HEPATIC PROBLEMS

Although this subject is not directly related to the main theme of this paper, for practical reasons and because of its empirical value to those who have not made a special study of the liver function tests that it is best to employ to obtain maximum information in a study of the various types of hepatic problems, information in this regard has been summarized in table 6.

FURTHER COMMENTS IN REGARD TO THE ELEVEN LIVER FUNCTION TESTS EMPLOYED

Certain liver function tests other than the eleven listed earlier in this article are employed elsewhere. Some of them are very satisfactory. It has been our experience, however, that these eleven tests are entirely adequate and satisfactory for the study of any hepatic problem. The small group of several tests best adapted to the study of each different type of problem should be employed in order to obtain a comprehensive picture of at least several functions of the liver.

1. Since the cephalin test has been rendered reliable by the suggestions of Neefe and Reinhold[4] (with elimination of its hypersensitivity and of false positive results with normal serums), since its technic is simple and since it is an exceedingly sensitive index of parenchymal hepatic impairment, it now represents the most satisfactory single screening test available to detect the cases of early hepatic impairment.

2. The forty-five minute 5 mg. per kilogram photoelectric sulfobromophthalein test is probably the most valuable single test available. It is a true test of hepatic function with a moderately simple technic, and it has a wide range of use and value. It is a good screening test because of its sensitivity, and it is the best single test available for evaluating cases of chronic hepatitis, hepatic cirrhosis and metastatic carcinoma of the liver. If the sixty minute reading is also obtained, this test is also of value in appraising serious degrees of damage to the liver. Furthermore, if the photoelectric method is used, this test can now be employed in cases of hepatic jaundice to determine liver function, as we have recently suggested.[24]

3. A. If the more sensitive p_H of 7.55 is used, the value of the thymol turbidity test is appreciably increased. The fact that this test is twice as sensitive with this p_H as with that of 7.8 renders the test valuable as a screening test for subclinical cases; and this more sensitive test is more valuable in clinical cases of chronic hepatitis and cirrhosis. Since the test is a quantitative test it also retains its value with the more sensitive hydrogen ion concentration in cases of acute hepatitis.

TABLE 6—*Groups of Tests Especially Adapted to Study of Different Types of Hepatic Problems*

1. Screening Tests for Early Liver Impairment:
    (*a*) Cephalin test, (*b*) thymol tests with p_H 7.55, (*c*) 5 mg. per Kg 45 min. sulfobromophthalein test and (*d*) serum bilirubin *
2. Early Differentiation of Obstructive and Hepatic Jaundice:
    (*a*) Quantitative urinary urobilinogen test, (*b*) oral galactose tolerance test, (*c*) oral hippuric acid test (or interavenous method) and (*d*) blood prothrombin (vitamin K response)
3. Acute Hepatitis (Initial Impairment and Progress):
    (*a*) Serum bilirubin, (*b*) cephalin test, (*c*) thymol tests, (*d*) urinary urobilinogen and (*e*) hippuric acid test (oral or intravenous)
4. Chronic Hepatitis and Hepatic Cirrhosis
    (*a*) Sulfobromophthalein, (*b*) cephalin, (*c*) thymol tests (p_H 7.55), (*d*) oral hippuric acid, (*e*) serum albumin and (*f*) blood prothrombin
5. Metastatic Carcinoma of Liver:
    (*a*) Sulfobromophthalein test and (*b*) oral hippuric acid test
6. Maximum Liver Impairment (unfavorable prognosis):
    (*a*) Low serum albumin, e g., below 2.5 Gm. per 100 cc, (*b*) low oral hippuric acid below 50% of normal (below 1.5 Gm), (*c*) low blood prothrombin of 10% to 15% of normal, or lower,† (*d*) very high sulfobromophthalein retention (60 min. reading)

* The intravenous hippuric acid test is sensitive enough to be included among screening tests, but its technic is complicated.

† In fatal acute yellow atrophy cases we have seen blood prothrombin drop to 0 in spite of vitamin K therapy.

B. The two advantages of adding the thymol flocculation determination to the thymol turbidity reading as a routine procedure have been noted previously herein.

4. The oral hippuric acid test as simplified by Boyce and McFetridge[6] is, because of its intermediate sensitivity, a particularly valuable test to graduate the degree of subclinical impairment of the liver when the most sensitive tests have yielded positive results.

---

[24] Gaebler.[2a] Mateer, Baltz, Comanduras, Steele and Brouwer.[1c]

5. As emphasized by Tumen and Bockus,[11] the serum albumin determination is of particular aid in the evaluation and prognosis of hepatic cirrhosis.

6. If vitamin K is given parenterally for several days before the prothrombin level of the blood is determined, the four possible causes of a low blood prothrombin determination other than impairment of the liver are all ruled out, and the serum prothrombin test becomes a reliable and valuable index of hepatic function. It is especially valuable in demonstrating the more serious grades of disease of the liver.

7. The quantitative serum bilirubin determinations are of aid (1) in detecting early subclinical jaundice and hepatic impairment and (2) in following the complete course of either hepatic or obstructive jaundice. In hepatic jaundice it is a rough index of liver function.

8. The oral galactose tolerance test, one of the less sensitive tests, is of practical value mainly in helping to differentiate obstructive and hepatic jaundice.

9. The total blood cholesterol and ester level constitutes a still less sensitive and also less specific index of liver function, which we employ only occasionally. A definite and progressive decrease in the esters suggests progressive and often serious hepatic damage. In chronic cholangiolitic hepatitis there is usually a particularly high total blood cholesterol determination, along with relatively normal results from other liver function tests. This recently emphasized disease consists of an intrahepatic obstruction due to a chronic inflammatory reaction in the region of the small bile ducts which causes intrahepatic obstructive jaundice.

10. The intravenous hippuric acid test has been discussed in detail in a previous publication.[1a] It is an excellent and decidedly sensitive test. However, the technic and time involved are greater for this than for the other tests mentioned.

11. The simplified quantitative urinary urobilinogen test merits wider use in the types of hepatic disease previously indicated.

TYPE OF THERAPEUTIC TEST EMPLOYED

1. *Diet.*—The program of intensive liver therapy employed in the treatment of these early subclinical cases has been essentially the same as that employed in the treatment of cases of advanced hepatic disease. The diet has been high in carbohydrate, high in protein and rather low in fat and has contained 350 to 400 Gm. of carbohydrate, 125 to 150 Gm. of high quality protein [25] and 35 Gm. of fat each day (2,215 to 2,515 total calories). Recent experimental work indicates that there is no objection to giving enough fat to make the diet palatable in these cases, except for the steady gain in weight which results from increasing the total daily caloric intake.

2. *Vitamins.*—These patients received an adequate supply each day of properly balanced vitamin B complex (two capsules before each meal) to aid in metabolizing the high carbohydrate intake. This is important. Since the administration of unbalanced thiamine has a proved antilipotropic effect in aiding the deposition of fat in the liver, the importance of not giving large doses of thiamine unbalanced with B complex is obvious, not only in these patients with impairment of the liver but also in normal persons.

A potent supplementary vitamin A capsule [26] was also administered each day because of (*a*) the relatively low fat diet and (*b*) the low vitamin A content of the blood in the presence of hepatic impairment, as demonstrated by Ruffin and Wise.[27]

3. *Choline Chloride.*—Although not always essential, choline chloride (10 to 15 grains, or 0.65 to 0.97 Gm., before meals) has also been included in this program. (We have seen cases of acute hepatitis with poor appetite and, therefore, with inadequate protein intake, whose unfavorable course has been abruptly altered when choline chloride was added to the other treatment.) Choline has a desirable effect on the liver in any persons whose protein intake has been inadequate.

SUMMARY

1. In those cases presenting positive results with the more sensitive liver function tests (screening tests), we have emphasized the value of subsequently using the less sensitive tests in an initial attempt to determine the degree of impairment of the liver present in those patients who have not yet developed clinical evidence of hepatic disease.

2. The main objective, however, of this communication is to advocate a new method of refining the interpretation of positive results with the more sensitive liver function tests in identifying early subclinical cases of chronic impairment of the liver, particularly in those patients in whom negative results have been observed with the less sensitive tests. This method consists of subjecting these patients routinely to a therapeutic test of intensive liver therapy and then observing the time required for reactions to these sensitive tests to return to normal. The length of time required varied from seven days to fifteen months. The important deductions to be drawn from this varied response have been discussed. The employment of a therapeutic test to evaluate the positive results of the more sensitive liver function tests provides early diagnosis and effective early treatment in these neglected subclinical cases of early impairment of the liver.

3. Evidence is outlined for the validity of the diagnosis of chronic subclinical hepatic impairment.

4. Reference has been made to our previous publications,[1] in which the prevalent normal standards of the newer and more sensitive liver function tests have been intensively studied and corrected normal standards suggested, wherever indicated.

5. The value and sensitivity of the thymol turbidity test has been studied further. The desirable effect of the reduction of the p_H of the thymol buffer solution from 7.8 to 7.55 in doubling the sensitivity of the test for screening purposes is discussed in detail. The two advantages of adding a thymol flocculation determination to the turbidity reading are also noted.

6. The advantages of the photoelectric over the comparator block sulfobromophthalein sodium (bromsulphalein) test are outlined.

7. Special reference has been made to the recently suggested simplified quantitative urinary urobilinogen test of Watson, not referred to in our previous publications. Results of normal control studies with this test are reported.

8. The comparative sensitivity of the newer and for the most part more sensitive liver function tests with

---

[25] The meat, milk, cheese and other protein in the diet are supplemented by giving (in skimmed milk) a particularly well tolerated and palatable "partially hydrolyzed lactalbumen protein powder," rich in methionine as well as other amino acids but digested only to the peptone stage. This powder was obtained from J. B. Roerig and Company, Chicago, and the Gelatin Products Co., Detroit. It is called "Lactenz."

[26] Apexol, J. B. Roerig and Company, Chicago, contains 50,000 U. S. P. units of vitamin A

[27] Ruffin, J. M., and Wise, B.: The Value of Plasma Vitamin A Determinations in the Differential Diagnosis of Jaundice: Preliminary Report, Gastroenterology 4:466-472 (June) 1945.

each other and with certain of the older tests has been studied in detail and summarized.

9. Although the subject is not directly related to the main objective of this publication, for practical reasons and because of its empirical value the particular small subgroups of tests best adapted to the study of each of six major types of hepatic problems have been tabulated.

10. Special comments have been made with regard to the advantages and limitations of the eleven important liver function tests referred to herein and employed in this clinic.

11. The program of liver treatment employed in the previously mentioned therapeutic test has been described.

12. If such a therapeutic test were routinely applied promptly to all cases of chronic subclinical impairment of the liver demonstrated by the more sensitive liver function tests, three important objectives would be realized: (1) refinement of the interpretation of the sensitive tests as to the approximate degree of impairment present; (2) measurement of the magnitude of the therapeutic problem in each case, and (3) insurance of early and effective treatment of such patients before an advanced stage of hepatic disease has developed.

THE HEALING OPEN PILONIDAL WOUND

Unique Characteristics and Clinical Implications

PAUL C. BLAISDELL, M.D.
Pasadena, Calif.

Pilonidal surgery is even yet in disserviceable confusion. The approach of choice would seem to be that which first establishes fundamental principles based on an understanding of the unique characteristics and singular behavior of the pilonidal wound and proceeds from there. Instead there has been a trend toward the more devious methods of trial and error with emphasis on schemes of primary closure and largely with the tacit predication that the open method has long since reached a dead end. Furthermore, these efforts have not always respected affective variables or controls necessary to unimpeachable interpretation. Success has been individually attributed to various exclusive elements of meticulousness presumed to have been neglected by others. These include the use of special suture material or pattern of suture, different ways of obliterating dead space and of eliminating infection, preoperative preparation at times more prodigious than the surgical procedure itself and new "plans" of operation—with every variation of detail a "new" operation. Somehow one gathers the impression of attaining simple ends in an arduous way. The natural desire for the feasibility of primary suture has of course not dampened precipitate enthusiasms. Sulfonamide compounds used in the open wound had their day. Now it is penicillin. But unfortunately reports have merged its use inextricably with that of other variables, instead of first determining specifically by the use of controls just what results, if any, one can count on by its use alone in the prevention and elimination of infection in the pilonidal wound. I, myself, who have been kept awake sleepless nights by penicillin injections, would prefer to be one of the controls if included in such an experiment.

The situation becomes the more fatuous when it is realized that not only are the results themselves conflicting but that even the measures of appraisal—the very means of evaluating results—contribute to confusion by their susceptibility to differences of interpretation and emphasis. The foundation of pilonidal surgery has rested on statistics reduced to the two common denominators of recurrence rates and healing time. Yet nowhere to my knowledge is there statistical analysis of the causes of recurrence or even complete descriptive analysis, which is hardly a propitious beginning. There has been no explanation or even mention of the fact that the recurrence figures following the open method tend to be more dependable than those for suture and unduly advantageous to the latter method. Again, seldom in the literature is there a stated compliance with a sufficient time element of recurrence, to say nothing of common agreement or even suggestive evidence in regard to what constitutes sufficiency. By legitimate comparison, of what value would recurrence rates of cancer be with indifference to postoperative time lapse? I have encountered recurrences ten years after apparently successful suture; and yet there have been recurrence rates reported almost before removal of the last suture in the series or with incomplete data on the point. If this lapsed time were the same for both open and closed methods of surgical operation it could be disregarded as a constant mathematical factor. However, such is not the case.

The periods of healing time, hospitalization and disability have all been used as measures of comparison. Of these, healing time has received the most emphasis, although it actually means less to the patient and hence is of less real clinical significance than the periods of either hospitalization or disability. How long will the patient be in the hospital and, in particular, how long off the job? Those are the measures of his expense and of true surgical adequacy. In my experience total hospitalization requirements can be less by the open than by the closed method. While average disability exceeds healing time of the sutured wound, it is considerably less than the average time required for complete healing of the open wound. Furthermore, it seems strange never to have seen the requirements of recurrent cases, or at least their reckoned equivalent, averaged in with the original series in which they occurred. Such calculation would at the same time and in strict fairness count the factor of recurrence and yet dispense with it as a separate denominator. In other words, what is the average disability not just to operate on but to finally cure 100 cases of pilonidal disease—that is my suggestion for a simple, fair and inclusive criterion of method.

In the recent war the Army and Navy had their own system of computing disability. The recent literature has been largely preempted by service reports on primary suture, and a representative one showed 80 per cent of patients subjected to varying periods of treatment, disability or hospitalization in order to prepare infected cases for primary suture. But all this did not come within the military standard of healing time: preoperative time is apparently not time as it is known to ordinary mortals in civilian life and is simply crossed off the ledger as a figment. Then in the services—and only there—a patient is completely disabled while there remains even a microscopic vestige of granulation tissue, and as long as he is thus "disabled" he is hospitalized—

Read before the Section on Surgery, General and Abdominal, at the Ninety-Fifth Annual Session of the American Medical Association, July 4, 1946.

with cost no object. Thus healing time, disability and hospitalization become synonymous. In the light of this background healing time acquires a different meaning than in civilian life where an hour is an hour to all concerned (whether before or after surgical operation), where the patient can return to work when he feels able and where neither hospitalization nor disability benefits fall like manna from heaven. Here then must be recognized an anomalous integration of the three indexes, wherefore one should not without question or reserve transpose endorsement—lock, stock and barrel—to the dissimilar circumstances of civilian life.

Even were all this confusion of recurrence rates and healing time adjusted there must still be recognized a distinctly separate basis of choice for the occasional pilonidal operator, who after all probably performs the major portion of this type of surgical operation. For him the chief obstacle is actually that of complete excision of the lesion. Then all else becomes subordinate to which method favors the most forthwith determination of this mistake and the most expeditious means of restitution (fig. 6).

It is not my present objective to make a comparative appraisal of method but to cast doubt that the full potentialities of the open method have been reached and to indicate measures which might result in improvement—if and when one desires to use the method.

One cannot fully understand all that is involved until one discerns the peculiarities of the healing open pilonidal wound and its bearing on recurrence and on delayed healing, which latter has constituted the chief source of criticism and dissatisfaction.

Open pilonidal wounds usually heal in every respect like normal granulating wounds elsewhere, or occasionally they may exhibit varying degrees of delay in healing which amounts at times to prolonged periods or even to complete refusal to heal. Such behavior is independent of whether the wound was left open from the start or subsequently broke down following primary suture. For nomenclative convenience these are called "distressed wounds." The distressed pilonidal wound is a unique entity. It has been misconceived as an integral unit, whereas close observation reveals distinct —and untoward—characteristics in different parts. These do have a relationship to the proclivities of the wound as a whole—obviously no wound can heal unless its parts heal—but the most resourceful therapy is contingent on the correlation of these distinctive features and their morbid issues.

The bony surface which underlies the pilonidal wound is not flat longitudinally but a convex curve, which curve is continued in the soft parts between the coccyx and anus. Later one finds that even this simple fact is of practical use. The soft tissues comprising the area include a relatively flat area near the point of origin of pilonidal disease and a comparatively flat surface around the anus, but between the two there is a cleft whose surfaces are at right angles to these other surfaces—the whole resembling a twisted lemon peel. Now it makes considerable difference whether a lesion is limited to the flat area over the sacrococcygeal joint or whether it extends into the cleft. If limited to the flat area, and also as it is more superficial, the operative wound more nearly resembles ordinary wounds and thus presents only common surgical problems—or, more to the point, lack of special problems. Extension through the intergluteal cleft bears on topics both within and beyond the scope of the present paper: they include the choice of operative method, healing time and delayed healing, recurrence and the acceptable interpretation of relevant statistics.

Before continuing with this topic it is necessary to interject for the sake of completeness that perhaps the most commonly seen cause of delayed healing and recurrence is unrelated to any unique characteristics of the pilonidal wound itself. That cause is incomplete operative removal of the lesion. For the sake of brevity I confine myself here to a short statement concerning it. 1. Incomplete removal is far more common than is realized, as I have repeatedly demonstrated, and yet recurrence statistics in the literature assume without exception that complete excision has been performed. This falsely serves, among other things, to obliterate statistical favorableness as between operative methods. Perhaps this will be clearer if the increase of the factor to the n^{th} degree is assumed, when recurrence after any method whatsoever will inevitably be 100 per cent. Here is another source of statistical error which can be added to the previous list. 2. In conjunction with block dissection the pathologic report can and should be helpful in warning of missing portions. 3. If not too flagrant, the error can be rectified in the course of the postoperative office care, provided that the error is determined early either by the pathologic report or by trained and persistent observance of the healing open wound. Such an expeditious termination is of course impossible in a sutured wound.

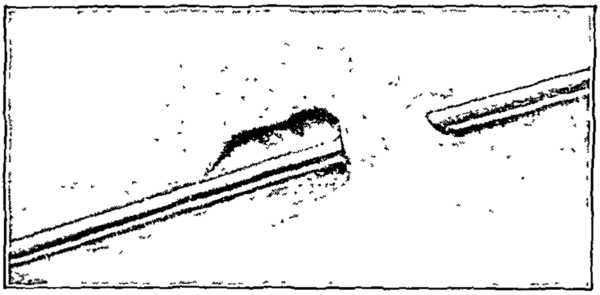

Fig. 1.—Superficial bridging of a healing open pilonidal wound as revealed with a probe. The same process also occurs with new granulation tissue in the depths of a wound. Undetected, bridging organizes into a permanent postoperative sinus which is clinical recurrence.

Perhaps the chief untoward characteristic of the open pilonidal wound is one which is common to fistula surgery, namely, the tendency of both *granulation tissue* and skin to "bridge" across (fig. 1). This leaves an underlying channel which is readily overlooked by inspection alone, for it is of a diameter often not greater than that of a probe and demonstrated only by its persevering use. Bridging is not of itself a reversible process, does not tend to rectify itself and if left intact becomes, or rather remains, a *permanent sinus. On the* other hand its effacement is readily effected if and when discovered. Otherwise it merges imperceptibly but inexorably into permanent refusal to heal. It is remarkable how hazy an idea the mechanism of recurrence is in the minds of many who nonetheless undertake pilonidal surgical operations, and how predominant is its vague association with infection. There are just two common sources of recurrence in the open wound, namely, a retained portion of the original sinus and the organization of bridged tissue into a postoperative incisional sinus. Control of recurrence in the open wound is then contingent only on complete removal of the sinus and on the prevention or destruction of postoperative bridging. (I shall later add a third possible cause of recurrence.)

Clinically, recurrence in the open wound—from any cause—is permanent delayed healing: that is, there is seldom any intervening period of complete healing. Here lies the mentioned source of error in the comparative statistics of recurrence as between the open and closed methods. With the patient continuously under observation for failure to heal and with delayed healing merging imperceptibly into recurrence, the surgeon can hardly fail sooner or at least later to become aware of recurrence. In contrast, recurrences following suture are wont to occur long after apparently satisfactory healing *and the discharge of the patient from observation*. Recurrences following the open method tend thus to obtain accurately in one's own statistics; those following the closed method too frequently come to light in some one else's figures. I have lately encountered recurrences after suture in patients discharged from service hospitals as cured, several years following operation.

Although bridging is commonplace in proctologic practice there seems to be little explanation of its mechanism in precise terms. It is undeniable that there somehow exists causal relationship between bridging and infection, and that is about where the matter has rested. Whatever this relationship, it is more pertinent from a practical point of view to know that the control of bridging, both prevention and cure, is not dependent on the control of infection (*in the open wound, that is*). Furthermore—and bearing on the prevention of bridging—infection would be impotent in its effect were it not for a certain tendency universal to wound healing—that of contraction. One learned in one's first pathology course that "In the first healing of the wound and in the course of formation of the granulation tissue a good deal of contraction occurs" (Mac Callum). One relearned it when one saw burns heal with contractures. But the association with surgical operation on fistulas has been out of mind. The next step in explanation is the interrelationship between this contractive force, the shape of the wound and euclidean geometry. In cross section a V-shaped wound, such as the pilonidal, constitutes two sides of a triangle which are in combined linear measurement greater than the third side, which is the air space between. The force of contraction on the uniting tissue in the cleft would therefore tend to detach it from the sides to the shortest conceivable locus, namely, the site of the projected third side (fig. 2). With a given contractile force, the more gradual the slopes of the wound the less separation there tends to be from the base and the broader the area over which it occurs; with the shallow wound which the proctologist has learned to seek in fistula operations there is induced the minimum tendency to bridging and the maximum vulnerability to its spontaneous disruption by everyday trauma. In a completely flat wound the force of contraction is exclusively lateral, operating only to separate the uniting edges from each other and not from the base.

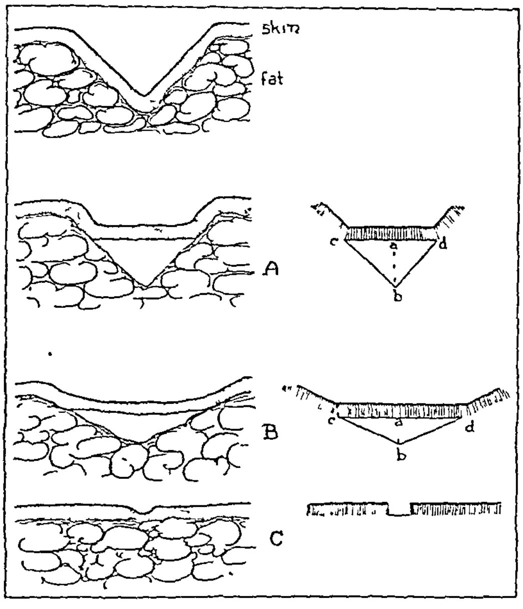

Fig. 2.—Relationship between contraction of healing tissue, slopes of the walls of a healing wound and postoperative bridging—in other words, the relation between saucerization and recurrence Upper cut shows skin edges united at the bottom of a healing wound in cross section. Cut *A* shows the ensuing effect of tissue contraction: distance *a* is less than that of the combined sides *bc* and *bd* and is the shortest possible locus of the involved tissue under contractile stress. Cut *B* shows the effect of more gradual slope to the sides the resultant component force *ab* is less than *ab* in *A*, and *cd* is greater than *cd* in *A* There tends, therefore, to be less separation from the base and over a broader area While illustrated for healing skin, the same principles hold for organizing granulation tissue Gentle slopes (saucerization) therefore not only lessen the likelihood of bridging—and hence to recurrence from bridging—but also favor destruction of bridging from natural trauma. In *C*, a flat wound, the vertical component for *ab* has reached zero, and hence there is no tendency to separation from the base and to bridging

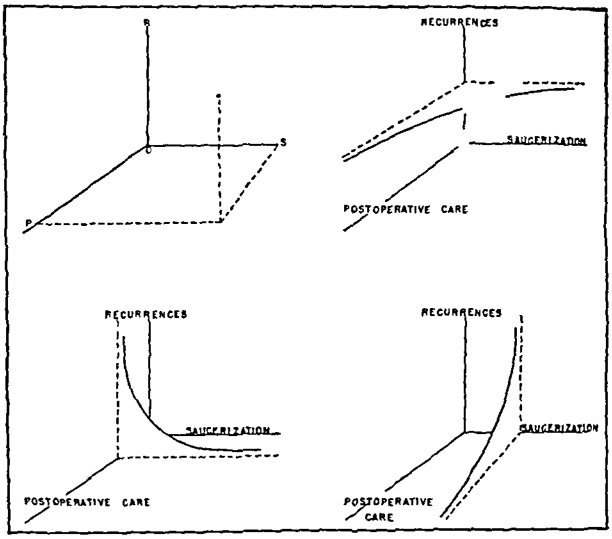

Fig. 3—Relationship between three variables involved in pilonidal surgery—saucerization, recurrences, and postoperative care. The cut upper left shows plan of locating a point in space by plotting of three variables Upper right shows by this method of plotting the relationship between saucerization and postoperative care when the factor of recurrence is assumed to be a constant. Thus postoperative care (including both quantitative and qualitative aspects) necessary to achieve a minimum recurrence rate varies inversely with the degree of saucerization obtained The ideal point on the curve is that at which with reasonable postoperative care the least amount of saucerization is conceded to assure against recurrence Cut lower left shows relationship between recurrence and saucerization under the imposed assumption of postoperative care regarded as a constant, which more or less tends to represent a true state of affairs In general, both the tenacity and skill of attention tend to be a constant for a given person, although varying between different persons And for a particular task, effective effort by the individual surgeon is constrained to a constant by his training and knowledge—or lack thereof: for example, if he does not know how to detect bridging, what causes recurrence or how to cope with delayed healing postoperative care will remain a minimum constant At best therefore, and for all surgeons, the recurrence rate bears inescapable inverse parallelism to saucerization Cut lower right shows the relationship between recurrences and postoperative care with imposed restrictions to saucerization Sacrifice of any normal tissue is always of itself a relative restriction it approaches the absolute as the dissection encroaches into the intergluteal cleft for reasons described under figure 4 Therefore recurrence rate is affected not only by the skill manifested in the operating room but also by that of postoperative care *In short, the surgeon can trade skill for detractive features of the open operation, and recurrence rates are a measure of the surgeon rather than of the method*

The conversion of wounds with steep sides to shallow forms for the prevention of bridging is called "saucerization," which in itself is nothing new. But from my explanation the principle can be stated that *the tendency to bridging, and hence both to delays in healing and to recurrence from the source, vary inversely with the degree of saucerization obtained. It also follows* then that both the diligence and competency of postoperative supervision necessary to prevent delayed healing and recurrence due to bridging vary inversely with the degree of saucerization obtained. At one extreme, simple incision of a sinus would pose the choice between an inordinate recurrence rate or such excessive postoperative care—amounting really to frequent reoperation—as to be impractical. At the other extreme, optimum shaping of the wound is sometimes either impossible or entails such sacrifice of tissue as again to prove impractical. Between these extremes one could trade tissue for security of the end result—as far as bridging and its outcome are concerned. The expert can and will, instead, trade skill for tissue: with forethought and planning in regard to an acceptable shape of the wound, it can be accomplished without the sacrifice of more tissue than is actually necessary for resection of the sinus—an "acceptable" shape, that is, in conjunction with the postoperative care of the expert. Thus every surgical operation represents, wittingly or no, the intersection of plottable variables (fig. 3). The ideal point is that at which with reasonable postoperative care there is the minimum loss of tissue necessary to assure uneventful healing. This is influenced by several factors, such as the depth of the sinus from the surface, the extent and complexity of pattern and the peculiarity of the anatomic situation.

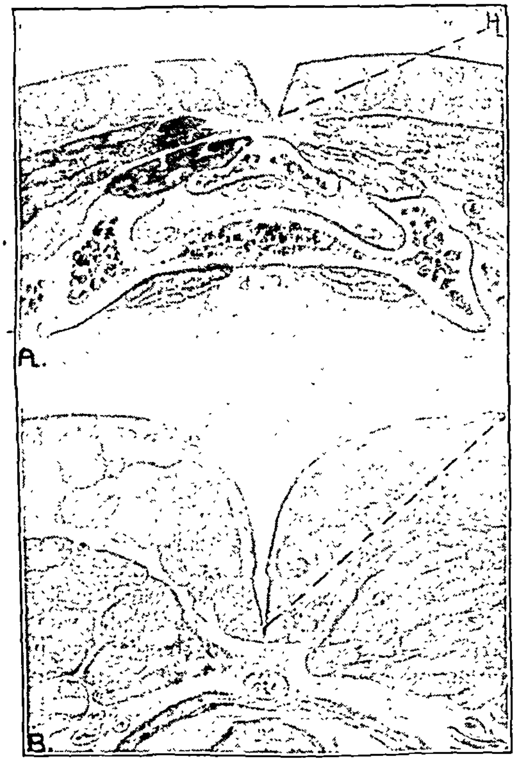

Fig. 4.—Illustrating the limits to saucerization of open pilonidal wound imposed by encroachment through the intergluteal cleft. The broken line in *A* shows the ease with which saucerization is obtained in ordinary sinus wounds or in pilonidal wounds which are limited to the flat surface near their origin. *B*, a pilonidal wound in the intergluteal cleft with the skin and wound surfaces in apposition. The broken line shows preposterous amount of buttock which would have to be removed in order to obtain even less saucerization than there is in *A*.

Elsewhere anatomic restrictions to saucerization in connection with anal fistulas have been discussed.[1] There is also anatomic restriction with pilonidal wounds. Because the intergluteal cleft, in particular, interferes with healing saucerization is most urgently needed there: but unfortunately that is also a place in which little saucerization can be accomplished because each of the lateral sides of the wound is part and parcel of the buttock. Theoretically desirable saucerization would involve preposterous loss of the buttock, as illustrated in figure 4. Thus is derived the compensatory necessity of proportionally more meticulous postoperative diligence if and as the wound encroaches on the intergluteal cleft—vigilance in recognizing and disposing of bridging and vigilance in utilizing other compensatory measures which I shall explain. Here, then, are characteristics whose implications are a forewarning.

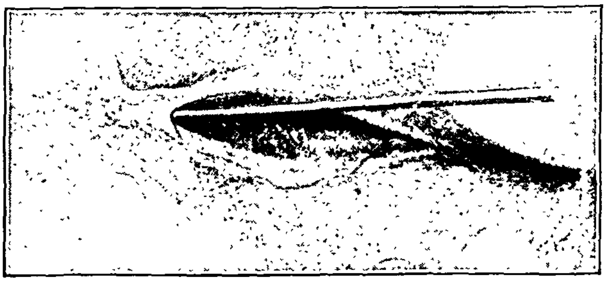

Fig. 5.—Overhanging skin end with the probe extending about ⅜ inch (1 cm.) under it. This wound had shown little if any progress toward healing for a period of six months. The treatment during that time had been office curettement and application of antiseptics. For the cause and treatment see legend for figure 6.

Now most surgical wounds everywhere heal predominantly from the sides. It seems never to have occurred to anyone that a wound can heal from the ends as well as from the sides and that if special difficulties are encountered with the latter—such as with cleft encroachment—special compensating use might be made of healing from the ends. Certainly there should be inquiry as to possible local interference with at least normal healing at these two critical points.

Observation of the ends of distressed pilonidal wounds often reveals a rounded, sharp, overhanging skin edge—or, if one prefers the description, an undermined skin edge (fig. 5). Like bridging, this is a cardinal indication of trouble and should be promptly recognized as such. One does not have to search for it as one does for bridging—it is there for all to see. It is a sign that the time for passivity has lapsed and that a reappraisal by immediate and searching examination of the wound is imperative. Notwithstanding which, such conditions are allowed to drag on for useless weeks

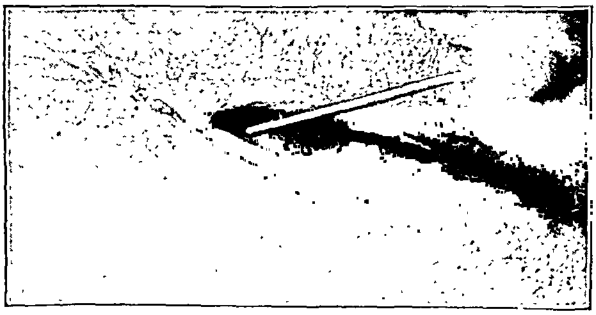

Fig. 6.—This is the same case as figure 5. Careful probing revealed a retained portion of the original sinus going off to one side. (Postoperative incisional sinuses almost invariably occur strictly in the longitudinal direction of the wound.) Reoperation corroborated the diagnosis. After removal of the lesion in the operating room the wound healed promptly. This case illustrates delay of healing and recurrence often blamed on the open method and due instead to fault of the surgeon. The latter had also failed to avail himself of one of the chief advantages of the open method, namely, the early recognition of incomplete operation.

---

[1] Blaisdell, P. C.: Traumatic Injuries of the Rectum, J. A. M. A. 128: 559-563 (June 23) 1945.

or even months to the disgust of the patient, the discredit of the surgeon and the undeserved disrepute of the operative procedure.

There are only three common causes of undermined skin ends. Two of these are, respectively, an underlying retained portion of the original pilonidal sinus and underlying postoperative bridging. In either case the undermined end is obviously an omen of trouble requiring radical intervention. The fault lies not with the method but with the surgeon: it is his fault that such a stage is reached, that further procrastination is indulged and that recurrence rates are adversely affected. One begins to suspect that there are ways and ways of performing the open operation as well as the closed.

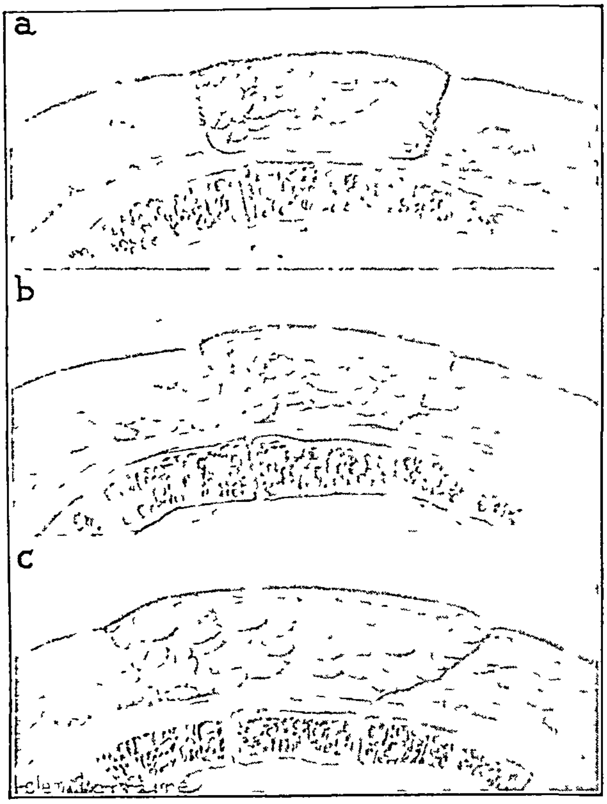

Fig 7 —Several degrees of slope to the ends of open pilonidal wounds. Cut *a* shows steep ends which commonly result unless particular attention is paid to the point; these predispose to overhanging ends and delayed healing In *b* the wound has actually the same length at the skin level as that shown in *a* The sloping ends have been achieved at no extra sacrifice of normal tissue but by forethought and care in planning and dissection Cut *c* shows gently sloping ends achieved by simple incision at the ends of the wound shown in *a* Incision was carried from the floor of the wound to the surface of the skin at about 1 inch (2.5 cm) away from the original ends of the wound Although in cross section this wound looks larger than that in *a* there is actually no additional loss of tissue, and the wound will heal faster and with less likelihood of delay.

The third cause of an undermined end is a characteristic of the healing pilonidal wound never heretofore envisioned. It reverts to the same contraction of healing tissue which causes bridging, the effect simply altered by different circumstances. The force of contracture on the circular skin as it dips into the wound and clings to the underlying granulation tissue is analogous to a tightening purse string, were it placed at the very edges. The skin tends to detach as if to span the cavity like a drum head. In terms of mathematics and geometry this is because the area of the wound at skin level is less than that of the actual wound surface. The mechanism is imitated by dipping a rubber dam into the wound in contact with all raw surfaces and then pulling on the periphery. Steepness of the end of the wound pertains exactly as steep sides to linear bridging. That is, gradual longitudinal slope from the ends to the floor serves to prevent overhang just as saucerization of the sides counteracts bridging. The same rule applies in both instances, viz., the more gradual the slope the less separation of skin from its base.

Unlike saucerization, gradual slopes of the longitudinal ends of the wound can always be accomplished, and remarkably, with no sacrifice whatsoever of tissue All that is necessary is a simple linear incision at both ends, from the floor of the wound gradually sloping longitudinally upward and outward to the skin surface about 1 inch (2.5 cm.) or so away (fig. 7). Hardly anywhere will so little assure so much.

Perhaps the reason that there is not even more trouble from steep ends is that the shape of the area from the sacrum to the anus is, as has been pointed out, a curve; longitudinal incision across this tends automatically to create a flat chord (fig. 8). But the same figure also reveals the common mistake of failing to complete the chord at the extreme ends—right at the most critical places. Only a trifle of extra attention—often just a tiny snip at either end—will determine whether the case will appear in some one's statistics on delayed healing and thereby cast unwarranted reflection on the open method. I cannot say at this time that this mechanism acts as an absolute deterrent to healing—a third possible cause of recurrence.

The treatment of an undermined skin end begins with now obvious means of prevention. It continues postoperatively with the immediate severance of bridging and with the maintenance of a flat or gently curving longitudinal floor by breaking down newly formed tissue out of line.

Confronted by the actuality of an overhanging skin end one should usually insist on examination of the patient under anesthesia, particularly if there is not a pathologic report which offers convincing evidence of complete original dissection. Thorough exploration and restoration of a distressed pilonidal wound are hardly feasible in the office, and complacency in this plan compounds delay. Retained sinus remnants and deep bridging can be dependably disposed of only with hospital care. An overhanging end due to failure in achieving at surgical operation or in maintaining afterward a flat floor can be corrected by the dissection procedure which I have used—under certain circumstances in the office (fig. 9).

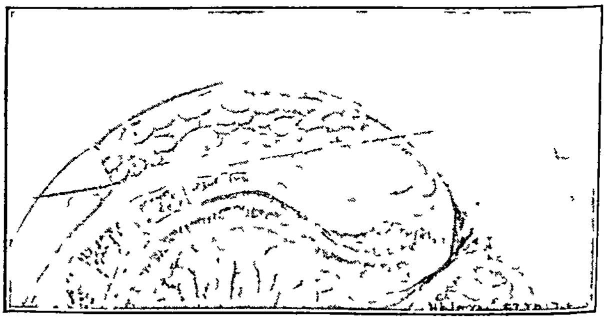

Fig 8 —A pilonidal wound naturally tends to occupy a chord across the curved surfaces of the area involved. Failure to complete the dissection, along the dotted lines, creates steep ends Simple linear incision along this dotted line would prevent overhanging ends which tend to form by reason of the steepness and would thus insure uneventful healing

Another characteristic of the healing open pilonidal wound is the excessive accumulation of exuberant granulation tissue. Regarded as a cause of delayed healing it is routinely treated by curettement. This is commendable practice although any improvement is probably due to destruction of either undetected bridging or retained sinus remnant. Seldom are the results epochal, which indicates that excessive granulation is an effect rather than a cause. This is further borne out in that it always accompanies delayed healing due to lesions previously described—retained sinus, postoperative bridging and overhanging ends—and recedes as they are counteracted. These three things, then, should be specifically sought when exuberant granulation evidences delayed healing.

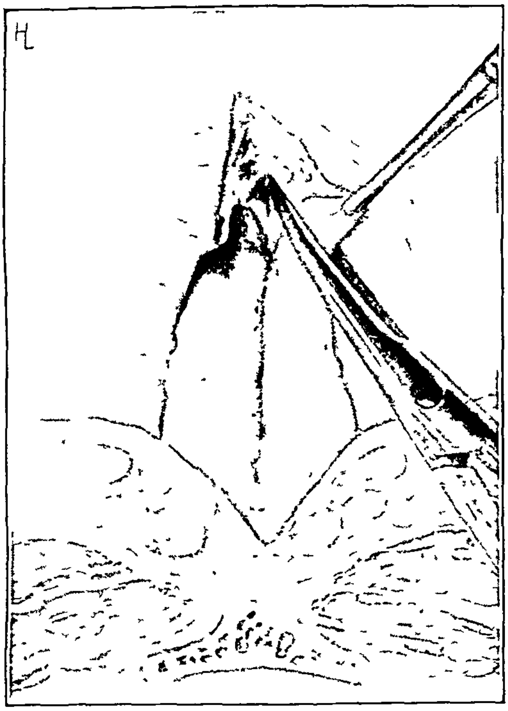

Fig. 9.—Dissection to correct overhanging ends when they have been due to steep wound ends. A sloping linear incision is made from the floor of the wound to the skin margin 1 inch (2.5 cm.) or so distant, and each side then is snipped with scissors as shown. This is technically possible in the office, and often feasible if one is sure that neither retained portion of the original sinus nor underlying incisional sinus is present.

In addition, excessive granulations occur when none of these three factors can be found. In my search for this further source of protracted healing I assumed as logical that a unique phenomenon could be attributable only to some unusual circumstance. The sole conspicuous possibility which came to mind was the rubbing together of the opposing surfaces of the wound as they involved the opposing buttock. Here is a circumstance found nowhere else and theoretically destructive of delicate new tissue: here is a parallelism of increasing etiologic trauma and redundance of new tissue as the wound embodies the intergluteal cleft. The validity of this surmise was substantiated by the dramatic results which attended my first test of a simple device to protect the wound surfaces.

The case was that of an 18 year old girl operated on by another surgeon and referred to me because after a period of two and one-half months there seemed little progress toward healing. In spite of repeated curettements both the patient and surgeon had become discouraged. Minute examination revealed no bridging or evidence of retained sinus or overhanging ends. Treatment consisted of drying all surfaces thoroughly and then applying a wide piece of adhesive lengthwise after flaming it to maximum stickiness. It was pressed into intimate contact with the raw wound surface by running the fingers longitudinally along the floor before applying pressure over the skin margins. When the patient returned a week later I was astonished to find the wound completely closed. It separated somewhat several days later but healed promptly and permanently after one more application of adhesive.

I now use an improved adhesive dressing (fig. 10), applying it as soon as possible and changing it soon after it works loose in about five days. Patients have remarked on the added comfort. Of course one who uses this procedure as a complete system of therapy in itself is doomed to disappointment. No doubt much the same effect is accomplished by rest in bed, though to what comparative degree it is impossible to say. Certainly it is a poor substitute in terms of convenience and expense to the patient.

Discussion of the open pilonidal wound would be incomplete without a word of emphasis as to infection, which, by and large, plays a negative role. Comparable open wounds after surgical intervention in the acute or in the quiescent stages show little significant difference in the patients' days of disability. (This does not hold for sutured wounds which break down because of infection. and the considerable additional time of disability involved counsels against the attitude that at least there is nothing to be lost in attempted suture.) Neither is infection in itself a material factor in delayed healing: the latter never looms until long after clean granulating surfaces have superceded evidence of what in any wound would be recognized as problem infection. Nor is control of either delayed healing or recurrence dependent on control of infection. Infection is simply not a problem of the open pilonidal wound. In deference both to the essentially infective propensity of the pilonidal lesion itself and also to the proximity of anal contamination this is eminently worth remembering.

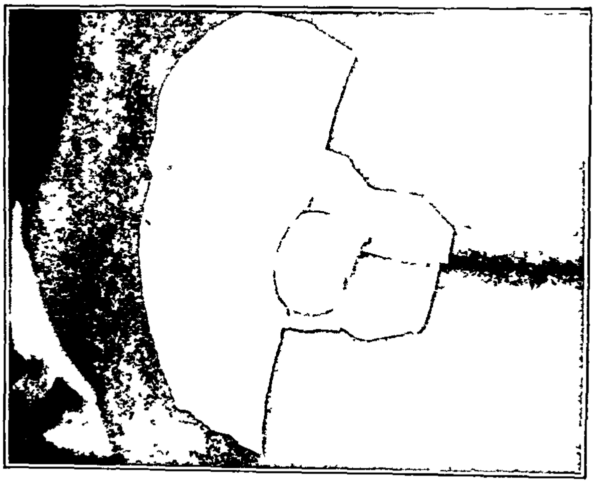

Fig. 10.—Improved adhesive dressing to prevent delays in healing due to trauma of opposing wound edges. The adhesive is applied in two separate layers of overlapping strips. All strips are well flamed before application to insure maximum adhesiveness. Both layers are applied transversely. The first is carried to the depths of the wound by making contact there first before applying pressure to the lateral skin edges. The photograph shows the second layer about three fourths completed, with cotton packed tightly between it and the first layer before continuing to completion. A final longitudinal strip of adhesive over all is carried in the midline from the skin above down to the perineum for the purpose of reenforcement.

One begins to discern how the establishment of and reference to principles answers questions as they arise. For example one can anticipate that a sulfonamide drug in the open wound will not solve all that is involved in delayed healing: one will differentiate the possible favorable consequences of accompanying rest in bed. On a broader basis one gains assurance that there is little which is inductive of delayed healing and recurrence which cannot be circumvented within the present scope or inherent possibilities of the open method. Recurrence figures for the open method are a measure of the reporting surgeon rather than of the method; and the aspect of delayed healing should not be considered insoluble.

It is hoped that these suggestions will not only resolve in measure at least some perplexities of delayed healing but if observed will also improve the time element of the average case. I do not believe that the full potentialities of the open method are yet known or that final appraisal is even near at hand. The behavior of the healing open pilonidal wound and its clinical implications are of course not the whole story, and more remains before the final topic of judiciously suiting method to individual circumstances.

102 North Madison.

ABSTRACT OF DISCUSSION

Dr. Curtice Rosser, Dallas, Texas: I recently solicited the opinion of a group of proctologists who were in military service. Twenty-one, or 77.7 per cent of the 27 who replied, believe that in civilian practice an open type of operation is preferable and offers greater freedom from recurrence. A number of the replies express sympathy for some of the primary closure technics under specified rigid criteria. Since the open procedure has apparently survived, it becomes, in Blaisdell's words, essential that we consummate its full potentialities and in particular reduce to a minimum the morbidity which has been urged as the principal deterrent to its use. The late Franz Schmelkes called attention to the fact that tissue growth in culture mediums proceeds at an optimum rate in a high concentration of hydrogen ions. Since pathogenic bacteria produce acid in the tissue, an infected wound contains a low concentration of hydrogen ions, and in a clean healing wound it is usually about p_H 7.3. He believed it more than mere coincidence that some of the established agents used in wound therapy including Dakin's solution, zinc peroxide and chlorazodin are buffered to slightly above neutrality. It was for this reason that he suggested the use of sulfanilamide buffered with calcium carbonate, which received a thorough trial. A number of reports have discredited the use of antibiotics, among them that of C. H. O'Donnell and associates, whose clinical study indicated that sulfathiazole used locally in wounds does not prevent their infection because dead tissue and foreign bodies inhibit the action of sulfonamide drugs and because sulfathiazole leads to increased bleeding and hematoma formation, a factor known to predispose to infection. The first few days after surgical intervention are most important from the point of view of infection. The work of Berman and his associates indicated that a normal untraumatized wound becomes immune to contamination by bacteria four days after surgery, this wound immunity being limited anatomically to the area surrounded by granulation tissue. The onset of such immunity, however, is delayed by any type of trauma, even the removal of stitches. It is evident, therefore, that during the earlier days of healing a broad, open wound should be protected from bacterial contamination and any avoidable physical injury. After this immunity is established, infection ceases to be a serious consideration and the mechanical factors stressed by Dr. Blaisdell, including excessive granulation tissue, bridging and subcutaneous pocketing become important. In my own work I have effectively combated exuberant granulation tissue in the healing pilonidal wound by magnesium sulfate solution rather than curettage, and I believe that its favorable action is due to drying the wound by crystallization and osmosis, both of which draw water from the tissues.

Dr. Claude C. Tucker, Wichita, Kan.: Dr. Blaisdell has not only established principles of pilonidal surgery but in so doing has also clarified the principles of fistula surgery, which have more or less been actually used by proctologists alone or which, perhaps, they have never expressed in clear terms for others. Although the origin of each lesion is quite different, the after-care of both conditions is similar in that the experience that one has had in treating fistula will facilitate one's skill in treating the pilonidals, for the after-care in each condition is just as important as the surgical operation. It is the consensus that pilonidals are of embryologic origin and not of the preen gland, which is of sexual origin. The organism of the fistula incubates in an anal duct, which opens into the cyst of Morgagni. These ducts are preformed structures, sometimes extending between the internal and external sphincter muscle. Either pilonidal cysts or fistula can have offshoots extending out into surrounding tissue; therefore, it is quite important at the time of surgical intervention that all diseased tissue be removed and as much healthy tissue be conserved as possible. It is equally important that the internal opening be sought, found and dealt with in the proper manner. Bridges, as in Dr. Blaisdell's figures 1 and 6, show how easily one can overlook an original sinus going off to one side, thus requiring careful research with a probe. Delayed healing is one of the bugbears of pilonidal surgery. Those lesions limited to flat surfaces heal readily, while those which involve the intergluteal cleft are more complicated and require special attention—first of all, complete removal of any sinus involved. It is important that removed tissue be subjected to a pathologic examination.

Dr. L. D. McGuire, Omaha: Having performed 50 of these pilonidal operations by the closed method without any recurrence, I cannot see why the patient should be subjected to the added morbidity of the open method. One can saucerize the elliptical incision when one intends to use the closed method. The main thing is to be sure that the whole sinus tract has been removed. That is facilitated by first injecting with methylene blue or some similar liquid, and by a saucerized elliptical incision following clear down to the bone and including the small portion of the coccyx next to the tract. It is different from a fistula. In the fistula the tract is followed into the rectum, which is a contaminated area. From then on the wound is an infected one, and should therefore be kept open. But the pilonidal sinus, once completely removed, should be a clean wound. It should be treated as a clean wound. In that saucerized area, by undercutting the fat next to the fascia or even below the fascia, out on to the buttock on each side, the whole area can be shifted to the center, be brought into intimate contact and held in that position by a series of mattress sutures, the first portion of the suture going deeply and the latter portion of the suture just catching the edges of the wound; after all the stitches are placed, the whole can be brought together into a nice neat linear scar. The patient can be out of bed in two or three days and leave the hospital in five or six, and it has been my experience that you do not get recurrences in that type of closure. I do feel that the mechanics described by Dr. Blaisdell are perfect for the open wound. I disagree in that I do not think it should be left open.

Dr. Paul C. Blaisdell, Pasadena, Calif.: As stated in my paper, I do not care to bring up at this time the topic of the comparative values of the open and closed methods. Hence I shall not comment at length on the remarks of the last discussant, although appreciative of them. Probably the most comprehensive and significant figures in the literature today are those of Kleckner, whose article appeared about 1939 in the Transactions of the American Proctologic Society. He reported a series of over 4,000 cases operated on by members of the American Proctologic Society. As these statistics represent not the work of one man but the composite efforts of a representative group they are in my opinion still the most reliable statistics to date. I wish to emphasize only this one fact—that in those statistics the recurrence rate after the closed operation was twenty times that after the open method.

Special Article

HISTORY OF THE AMERICAN MEDICAL ASSOCIATION

MORRIS FISHBEIN, M.D.
Editor, Journal of the American Medical Association
and Hygeia, the Health Magazine
Chicago

(Concluded from page 849)

(NOTE.—*Following is the twenty-first chapter of a history of the American Medical Association, in process of development for publication in connection with the celebration of the Centennial of the American Medical Association in Atlantic City in June 1947.*

The general account of the history of the Association will be followed by individual histories of the various councils, bureaus, publications and other activities of the Association. The general account is written by the editor of THE JOURNAL. *Each of the other historical contributions will be by a member of the individual council, bureau or agency responsible and now associated with it or directly related to its work. Included will be photographs, signatures and a brief biography of each of the hundred presidents of the American Medical Association. This feature has been prepared by Dr. Walter L. Bierring.*

It will be impossible to publish all of the material in THE JOURNAL. *The complete work will be published in book form. It is hoped to have it available by the time of the annual session.*—ED.)

CHAPTER 21. *Changing Views of Sickness Insurance*

1920-1924

1920

NEW ORLEANS

By the end of 1919 correspondence began to reach THE JOURNAL opposing the reports that had been issued by the Council on Health and Public Instruction and by its subcommittee on social insurance. The writers charged that these reports were unscientific and more in the nature of propaganda for compulsory health insurance than scientific studies. Comparisons had revealed that many of the statements presented in the pamphlets published by the Council could be found in the propaganda issued by the American Association for Labor Legislation. Attack centered particularly on I. M. Rubinow, who had been secretary of the subcommittee on social insurance and who was responsible for most of the pamphlets. Circulation of the pamphlets was promptly discontinued. It was discovered, incidentally, that Dr. I. M. Rubinow was at the same time in the employ of the American Association for Labor Legislation.

HOSPITAL STUDIES

With much travail, early in 1920 a technic was developed for adding the listing of hospitals to the work of the Council on Medical Education. That task having been successfully accomplished, the function has been carried on continuously since that time.

THE BRAISTED ADDRESS

In his presidential address on Tuesday, April 27, at the New Orleans session, Admiral Braisted of the U. S. Navy read a presidential address which lasted a long time—variously estimated from one and a half to two and a half hours. In the minutes of the Board of Trustees appears a resolution that it is the sense of the Board of Trustees that no address at the opening meeting of the Scientific Assembly should exceed thirty minutes in its delivery. Physicians who were present when Admiral Braisted read his address reported that most of the assemblage listened carefully for the first thirty minutes but that members departed in increasing numbers, so that toward the end the hall presented vast areas of unoccupied seats. The address was titled "The Obligations of Medicine in Relation to General Education."

THE DIRECTORY REPORT SERVICE

At the suggestion of Mr. Will C. Braun and with the hearty cooperation of Dr. George H. Simmons, the American Medical Association in 1920 introduced its directory report service as a supplement to the directory. The reception of this report service by agencies requiring constant correction of mailing lists was so favorable that the report service has been continuous since that time.

PROHIBITION AND MEDICAL TECHNICIANS

Now for the first time also there came to the Board of Trustees two problems which were to be of great import in the ensuing years. The first was prohibition! The second was the fact that increasingly technicians were administering anesthetics and doing roentgen ray work and that laymen were conducting diagnostic laboratories.

Most of the early portion of 1920 was concerned with increasing costs of paper and labor and with the necessity of increasing the income of the Association by a rise in the price of THE JOURNAL.

THE NEW ORLEANS SESSION

The speaker of the House of Delegates, Dr. Hubert Work, had found some difficulties with the functioning of the Ad Interim Committee; he felt that its prescribed emergency duties might be delegated to the Board of Trustees or perhaps to the Executive Committee of the board. He urged compulsory military training. He pointed out that surgery was becoming dissociated from medicine and that it needed to be reoriented within the science of medicine; it seemed to him that the remedy lay with the American College of Surgeons.

The President of the Association, Dr. Alexander Lambert, spoke to the House of Delegates primarily on the growth and development of the hospital. There had been some resentment among the smaller hospitals to standardizing under the Council on Medical Education and Hospitals.

The report of the Board of Trustees called attention to the need of additional funds to carry on the activities of the organization and particularly to take up the new function of standardization of hospitals.

The Judicial Council had submitted a rewording of the Constitution and By-Laws, primarily with a view to clarity. For this most of the credit attaches to Dr. M. L. Harris of Chicago, chairman of the Judicial Council, whose legal mind was a great asset in such affairs.

SOCIAL INSURANCE

The Council on Health and Public Instruction was suffering from criticisms which had begun to appear in state medical journals, which felt that the Council should have taken a positive position against social insurance. The Council stated that it was not the business of the Council to formulate the policies of the Association. The Council felt, however, that its publications had certainly served to arouse the medical profession to a discussion of the subject.

NARCOTIC DRUGS
